Spent acids are restored and purified by adding a suitable quantity of a nitrate, which is decomposed, the liberated nitric acid strengthening the bath, while the base forms, with sulphuric acid present, an insoluble compound which acts as a settling agent. Fresh sulphuric acid may be introduced with the nitrate or afterwards.

350,497—October 12, 1886. G. M. MOWBRAY. *Manufacture of pyroxyline.*

The spent acid is restored in strength and bulk without precipitation and analysis by fortifying and adding to the drained spent acid of a previous nitration a mixture of concentrated sulphuric and nitric acids.

350,498—October 12, 1886. G. M. MOWBRAY. *Manufacture of pyroxyline.*

The use of steeled cast-iron pots is claimed for holding the mixed acids, and "Bessemer process steel" for tanks; also structural details of apparatus.

359,289—March 15, 1887. E. SCHULTZE. *Gunpowder.*

A composition of a nitro-hydrocarburet (such as nitro-colophony, tar, turpentine, or turpentine-oil), pyroxyline, and nitrates or salts furnishing oxygen in combination with nitrogen; as colophony, 12 parts; pyroxyline, 60 to 80 parts; barium nitrate, 60 to 80 parts; and potassium nitrate, 8 to 10 parts.

363,197—May 17, 1887. R. BERNSTEIN. *Granular nitro-cellulose.*

Prepared from the pulverized nuts, fruits, or shells of nuts of the *Phytelephas macrocarpa*, or "vegetable ivory" and kindred plants, and forming smooth grains that pack without cohesion.

366,281—July 12, 1887. C. W. VOLNEY. *Explosive compound.*

A solution of nitro-starch in nitroglycerine; also the same with oxidants, as chlorates and nitrates.

371,376—October 11, 1887. H. SCHÖNEWEG. *Explosive.*

Consisting in nitrated carburets of hydrogen and nitrated cellulose with an oxalate or oxalic acid.

417,577—December 17, 1889. J. F. A. MUMM. *Explosive compound.*

A mixture of potassium chlorate, 1 pound; antimony, 8 ounces; charcoal, 1 ounce; flowers of sulphur, 2 ounces; glycerine, 1 ounce; collodion, 1 ounce; sulphuric acid, 4 drops; nitric acid, 2 drops; alcohol, 3 ounces; and water, 2 to 3 ounces.

420,445—February 4, 1890. J. R. FRANCE. *Soluble nitro-cellulose and process of manufacture.*

Soluble nitrocellulose composed of pure mechanically comminuted cotton fiber nitrated, produced by mechanically reducing cotton to a uniform and homogeneous dust-like condition and then treating with a bath of nitric and sulphuric acids, in the proportions, say, of nitric acid, 42° Baumé, 8 parts, and sulphuric acid, 66° Baumé, 12 parts.

420,446—February 4, 1890. J. R. FRANCE. *Insoluble nitrocellulose and preparing the same.*

Insoluble nitrocellulose consisting of pure mechanically comminuted cotton nitrated, produced by mechanically reducing cotton to a uniform homogeneous dust-like condition, treating it in a bath of nitric and sulphuric acids in the usual proportions and strength, at about 75° F., for about fifteen minutes, and pressing out the superabundant acids, and washing.

420,477—February 4, 1890. J. R. FRANCE. *Cotton-fiber dust and preparing the same.*

Mechanically comminuted cotton-fiber dust for the manufacture of nitrocellulose, produced by forming the cotton into a card or lap and cutting or otherwise reducing the fibers in their natural state to cotton dust by mechanical means.

430,215—June 17, 1890. H. S. MAXIM. *Recovering solvents from explosives.*

In the manufacture of explosive material, the dissolved material is exposed in receptacles in a drying chamber and a constant circulation of air or gas maintained through the drying chamber and a communicating condensing chamber, the air or gas being heated before entering the drying chamber.

434,287—August 12, 1890. G. M. MOWBRAY. *Process of manufacturing nitrocellulose.*

A continuous web of cellulose paper is moved through an acid bath, compressed, then through a washing fluid, dried, and a solvent is then distributed upon the continuously moving web, and it is formed into a roll to diffuse the solvent.

443,105—December 23, 1890. G. M. MOWBRAY. *Method of preparing nitrocellulose.*

Cellulose material, whether fibrous, felted, or textile, is impregnated by crystallizing a salt, preferably sodic nitrate, in the interstices of the material; the dry saline-impregnated cellulose material is then immersed in a bath of sulphuric and nitric acids, and then removed, washed, and dried.

454, 281—June 16, 1891. H. S. MAXIM. *Method of making gun-cotton.*

Charges of cotton are treated in a given order in each of a series of acid vats, the excess of acid expressed from the cotton and returned to the vat from which it was taken, and as the acid in said vats becomes spent the weakest acid of the first vat of the series is replaced with fresh acid and the order of immersion changed in accordance with the relative strength of the acid in the several vats.

455,245—June 30, 1891. H. DE CHARDONNET. *Manufacture of pyroxyline.*

Process consists in the successive steps of nitration, centrifugal extraction of spent acids, washing of the pyroxyline, and neutralization of the wash water by an alkaline or basic material to recover the residue of nitric acid left in the pyroxyline by the centrifugal action, and reuse of the water with successive quantities of pyroxyline.

465,280—December 15, 1891. H. MAXIM. *Method of making nitrocellulose.*

Pyroxyline of a high grade is produced by immersing the cellulose for a short time in a bath of strong-acids mixture, then conveying said cellulose with contained acids (amounting to, say, six or more times the weight of cellulose) to a second bath containing many times the weight of the cellulose of a weaker acids mixture, and there completing the conversion by digesting for a considerable time.

474,778—May 10, 1892. H. MAXIM. *Process of making nitrocellulose.*

Cellulose is first converted into a lower nitro compound, such as dinitrocellulose, in a preliminary bath of suitable acids, the excess of acid removed by mechanical means and washing, then dried, and then immersed in a stronger bath of acids suitable to convert it into trinitrocellulose, or pyroxyline. The adhering strong acids are washed therefrom into the first bath by passing the weaker acids mixture through it and back into the bath.

479,988—August 2, 1892. H. MAXIM. *Method of restoring nitrating acids.*

A quantity of dry nitrate is added to the weakened mixture, the acid sulphate allowed to crystallize, the liquor is removed from the crystals by a centrifugal machine, and the crystals further washed by a portion of the weakened mixture.

487,080—November 29, 1892. J. V. SKOGLUND. *Explosive powder.*

It consists of dried grains of nitrated cellulose gelatinized by means of a solvent containing a fat or fatty acid, with or without saltpeter.

514,830—February 13, 1894. R. C. SCHÜPPHAUS. *Nitro compound and process of making same.*

A pyroxyline composition having urea incorporated therewith, to secure stability.

516,295—March 13, 1894. H. M. CHAPMAN. *Explosive.*

The combination with a nitro-explosive as an agglomerating agent of formic ether.

516,924—March 20, 1894. F. G. DU PONT. *Process of drying nitrocellulose.*

Wet nitrocellulose is placed in a hydrocarbon oil, as kerosene, and the oil vaporized, thereby removing the water from the fiber.

526,752—October 2, 1894. R. C. SCHÜPPHAUS. *Process of nitrating cellulose.*

The weakened acid bath is restored by adding sulphuric anhydrid and nitric acid; with oil of vitriol in certain cases.

541,899—July 2, 1895. B. THIEME. *Process of making nitropentaerythrit.*

Nitropentaerythrit, suitable for use as a smokeless explosive, is produced by treating pentaerythrit, which is produced by the condensation of acetyldehyde and formaldehyde in the presence of lime, with concentrated nitric and sulphuric acids.

544,924—August 20, 1895. H. MAXIM. *High explosive.*

An intimate mechanical mixture, in a fine state of division, of an explosive colloid of gun-cotton and nitroglycerine and wet fibrous gun-cotton; the latter may hold in suspension in its pores a solution of an oxygen bearing salt, such as nitrate of ammonia.

640,160—December 26, 1899. C. F. HENGST. *Explosive compound.*

Esparto grass is mechanically disintegrated, macerated in a sulphuric-acid and nitric-acid bath, the liquor expressed and the pulp washed, boiled in an aqueous solution of potassium bicarbonate, the product colored with hydrochloride of triamidoazobenzene, washed and strained, dried, ground with starch, charcoal, and potassium nitrate, dried, sifted, molded, and the grains waterproofed.

647,420—April 10, 1900. A. LUCK AND C. F. CROSS. *Process of increasing stability of nitrocellulose.*

The nitrocellulose is freed from the nitrating acid, treated with a solution of acetone and metallic salts and alcohol, and washed in successive washes to remove the acetone.

667,759—February 12, 1901. D. BACHRACH. *Nitrocellulose or similar substance and process of making same.*

A nitrocellulose containing a sulphate, as sulphate of lime, constituting 30 per cent or more by weight of the solid constituents of the compound, forming a noncombustible cellulose, may be formed by adding to the other constituents thereof carbonate of lime and sulphuric acid in proper proportions.

DYNAMITES.

78,317—May 26, 1868. A. NOBEL. (*Reissues: 5,619—October 21, 1873; 5,799—March 17, 1874; and 10,267—January 9, 1883.*) *Explosive compound.*

A combination of nitroglycerine with infusorial earth.

93,752—August 17, 1869. T. P. SHAFFNER. *Improved explosive compound for use in firearms, blasting, etc.*

Nitroglycerine is mixed with granulated plaster of paris.

93,753—August 17, 1869. T. P. SHAFFNER. *Improved explosive compound.*

A mixture of nitroglycerine with comminuted sponge or other vegetable fiber, with or without the admixture of plaster of paris.

93,754—August 17, 1869. T. P. SHAFFNER. *Improved explosive compound.*

Nitroglycerine is mixed with metallic powder, such as red lead, with or without an admixture of plaster of paris or any alkaline substance.

98,382—December 28, 1869. J. HORSLEY. *Improved nitro-glycerine compound for blasting.*

From 20 to 25 per cent of nitroglycerine is incorporated with a powdered mixture of Aleppo or other foreign gallnuts and potassium chlorate; or with galls, charcoal, and potassium chlorate; or galls, cream of tartar, and potassium chlorate; or galls, hard sugar, and potassium chlorate.

98,427—December 28, 1869. T. P. SCHAFFNER. *Improved explosive compound.*

Gun cotton is treated with nitroglycerine.

98,854—January 18, 1870. C. DITTMAR. *Improvement in explosive compounds.*

"Dualin," consisting of cellulose, nitrocellulose, nitro-starch, nitro-mannite, and nitroglycerine, mixed in different combinations, according to the strength desired.

99,069—January 25, 1870. C. DITTMAR. *Improved explosive agent, called "xyloglodine."*

It consists of glycerine-starch, or glycerine-cellulose, or glycerine-mannite, or glycerine-benzole, or analogous substances, treated with a mixture of nitric and sulphuric acids. It is a milky reddish or white fluid and may be mixed with cellulose or other porous substances.

120,776—November 7, 1871. E. A. L. ROBERTS. *Improvement in explosive compounds.*

Asbestos is combined with nitroglycerine, or other explosives, with or without infusorial earth or silica.

138,841—May 13, 1873. T. S. BEACH. *Improvement in explosive compounds.*

A compound formed of an alkaline nitrate, nitroglycerine or equivalent nitro-substitution product, wood-fiber or other material containing cellulose, and paraffine or equivalent wax-like material.

139,468—June 3, 1873. E. JUDSON. *Improvement in explosive compounds, or giant powder.*

A mixture of nitroglycerine with infusorial earth, sodium nitrate, resin and sulphur, or their equivalents.

139,746—June 10, 1873. T. VARNEY. *Improvement in explosive compounds.*

Dynamite is granulated while it is freezing or when frozen, and can then be used in its frozen state.

141,455—August 5, 1873. A. NOBEL. *Improvement in explosive compounds.*

A mixture of sodium nitrate and resin, or their equivalents, with or without sulphur, with nitroglycerine.

141,585—August 5, 1873. J. H. NORRBIN AND J. OHLSSON. *Improvement in explosive compounds.*

Nitrate or nitrite of ammonia is combined with a fulminate, as nitroglycerine.

146,530—January 20, 1874. W. N. HILL. *Improvement in blasting compounds or dynamites.*

A mixture of nitroglycerine and a silicious powder, prepared by precipitation from solutions of the silicates.

150,428—May 5, 1874. G. M. MOWBRAY. *Improvement in blasting powders.*

A mixture of nitroglycerine with finely divided mica.

153,086—July 14, 1874. C. L. KALMBACH. *Improvement in explosive compounds or dynamites.*

A mixture of a coarsely-ground farinaceous substance, such as corn meal, and nitroglycerine. Nitroglycerine is packed for shipment in nonmetallic vessels, holding, with the nitroglycerine, an equal amount in bulk of atmospheric air; when not in transit it is stored in perpendicular or flaring-sided nonmetallic open vessels, covered only with a film of water.

157,054—November 17, 1874. J. W. WILLARD. *Improvement in explosive compounds.*

It is composed of carbonate of magnesia, nitrate of potash, chlorate of potash, sugar, and nitroglycerine.

164,263—June 8, 1875. P. CASTELLANOS. *Improvement in explosive compounds.*

It consists of nitroglycerine, nitrobenzole, or benzine (to reduce the point of congelation), fibrous material, and pulverized earth.

164,264—June 8, 1875. P. CASTELLANOS. *Improvement in explosive compounds.*

It consists of nitroglycerine, potassium, or sodium nitrate, picrate, sulphur, carbon, and a salt insoluble and incombustible in nitroglycerine, such as the silicates of zinc, magnesia, and lime, carbonate of zinc, etc.

167,503—September 7, 1875. H. COURTEILLE. (*Reissue: 7,068—April 18, 1876.*) *Improvement in blasting powder.*

A safety blasting powder containing the elements of common gunpowder and also the uncombined elements of nitroglycerine; produced by treating the components of ordinary gunpowder in the presence of oleaginous or tarry matters, peat, and metallic sulphates.

173,961—February 22, 1876. W. F. JOHNSTON. *Improvement in explosive mixtures.*

An explosive containing salts which contain nitric acid and ammonia (as a mixture of sodium nitrate and ammonium sulphate), that by their decomposition at the time of the explosion will produce nitrate of ammonia; as a compound of salts containing nitric acid and ammonia, and a small percentage of gunpowder, nitroglycerine, or other common explosive, to produce a primary combustion.

175,735—April 4, 1876. A. NOBEL. *Improvement in gelatinated explosive compounds.*

Gelatinated nitroglycerine, produced by dissolving in nitroglycerine a substance capable of gelatinating it, such as nitrated cotton. The process is applicable to other explosive fluids, such as the nitrates of methyl and ethyl.

175,929—April 11, 1876. J. COAD. *Improvement in blasting compounds.*

A mixture of nitroglycerine and decayed wood.

177,988—May 30, 1876. C. G. BJORKMAN. *Improvement in explosive compounds.*

A mixture of potassium nitrate, 20 parts; potassium chlorate, 20 parts; cellulosa, 10 parts; pea-meal, 10 parts; sawdust, 10 parts; and nitroline, 30 parts.

183,764—October 31, 1876. E. JUDSON. (*Reissue: 7,481—January 30, 1877.*) *Improvement in explosive compositions.*

A powder consisting of particles or grains of a gas-producing material, rendered nonabsorbent by a coating of varnish or cement, as by mixing and stirring the sodium nitrate and the coal into a mixture of molten sulphur, resin, and asphalt, the powder then being rendered explosive by the admixture or incorporation of nitroglycerine.

184,762—November 28, 1876. C. DE LACY. *Improvement in explosive compositions.*

It consists of pyroxyline, sawdust, potassium nitrate and chlorate, and nitroleum. (Nitroleum is obtained by adding stearic oil mixed with honey, or coarse glycerine, to a mixture of nitric and sulphuric acids; the oleic mixture being removed, washed, and impregnated with soda.)

190,954—May 22, 1877. O. BÜRSTENBINDER. *Improvement in explosive compounds.*

Vegetable substances are inspissated with glycocole or chondrin and saltpeter, then soaked in nitroglycerine, and granulated and dried.

203,482—May 7, 1878. E. MONAKAY. *Improvement in explosive compounds.*

An explosive compound containing nitroglycerine and a liquid hydrocarbon, diluent, such as kerosene oil.

227,601—May 11, 1880. R. W. WARREN. *Explosive compound.*

It is composed of gunpowder mixed with a powder made of nitroglycerine, nitrocellulose, and trinitrocellulose, formed by first reducing nitrocellulose and nitroglycerine to a coagulated mass, then adding trinitrocellulose until a dry powder is produced, and finally combining therewith gunpowder.

234,489—November 16, 1880. C. A. MORSE. *Explosive compound.*

Nitroglycerine and a resinous or equivalent substance in a solid, granulated, or pulverized mass; produced by dissolving nitroglycerine and resin in a common solvent, as methyl alcohol, and then evaporating the solvent. The mass may be stirred during distillation to break down the mass and discharge it in a pulverized form.

235,871—December 28, 1880. W. HEICK. *Explosive compound.*

It is composed of honey and glycerine treated with nitric and sulphuric acid and then mixed with chlorate of potash, prepared sawdust, and prepared chalk.

236,714—January 18, 1881. C. A. MORSE. *Manufacture of explosive compounds.*

A compound composed of nitroglycerine, resinous substance, and oxidizing agents, as niter, produced as in No. 234,489, with the addition of the oxidizing agents to the solution.

242,783—June 14, 1881. J. M. LEWIS. *Explosive compound.*

"Forcite," a plastic gelatinized nitroglycerine compound, comprising an inexplosive gelatinizing material, such as cellulose (unnitrated), and an oxidizing salt, as niter, combined with nitroglycerine.

249,701—November 15, 1881. T. VARNEY. *Explosive compound.*

An absorbent for nitroglycerine is prepared by mingling with the fine particles of the powder a small proportion of a fusible, soluble, or paste-producing material, and causing the same to melt, dissolve, or become paste while in the mixture, so that each particle of such material becomes an adhesive nucleous to which the surrounding particles attach themselves, and are held in aggregations when hardened by cooling, drying, or crystallizing.

252,250—January 10, 1882. W. R. QUINAN. *Blasting-powder.*

A high explosive composed of nitroglycerine, nitrocellulose, and potassium chlorate (or nitrate).

260,786—July 11, 1882. W. R. QUINAN. *Explosive powder.*

A low explosive, consisting of an untriturated nitrate—such as sodium nitrate—in the form of small masses or grains of determinate size, sulphur, pulverized or grained, carbonaceous material, either pulverized or in small nonporous grains of determinate size, the unpulverized ingredients remaining as separate grains, and a small proportion of nitroglycerine which forms a coating in contact with said small grains, whereby the surfaces of the ingredients are so limited in extent to retain the small proportion of nitroglycerine susceptible to detonation by the ordinary blasting-cap.

288,516—November 13, 1883. H. D. VAN CAMPEN. *Explosive compound.*

It consists of tan-bark, dextrine, cryolite, potassium nitrate, and nitroglycerine.

289,759—December 4, 1883. S. R. DIVINE. *Explosive compound.*

It consists of a solid ingredient—potassium chlorate, 5 parts—and a liquid ingredient, consisting of a mixture of dead-oil and nitroglycerine (in the proportion of 2 to 1) 1 part, mechanically mixed.

300,281—June 10, 1884. W. R. QUINAN. *Explosive compound.*

A low-explosive powder composed of a small proportion of nitroglycerine, carbonaceous material, pulverized or in nonporous grains, and an explosive salt in the form of nonporous untriturated grains or crystals, the unpulverized ingredients remaining as separate grains in the mixture.

307,988—November 11, 1884. J. H. ROBERTSON. *Dynamite.*

A compound of an anhydrous salt and nitroglycerine, produced by expelling the water of crystallization from the salt, reducing it to a powder, and mixing with it nitroglycerine, whereby the latter takes the place of the water of crystallization and a granular compound is produced.

307,989—November 11, 1884. J. H. ROBERTSON. *Explosive compound.*

Anhydrous sodium sulphate is combined with nitroglycerine.

312,010—February 10, 1885. R. S. PENNIMAN. *Protected nitrate of ammonia for use in explosive compounds.*

Nitrate of ammonia in a finely divided or granulated condition is protected against deliquescence by a coating of petroleum or its soft and viscous educts or products.

323,088—July 28, 1885. R. W. WARREN. *Dynamite.*

A compound of nitroglycerine, sodium nitrate, and ground peat, with or without calcic hydrate.

333,149—December 29, 1885. R. S. PENNIMAN AND J. C. SCHRADER. *Dynamite.*

An explosive compound containing finely comminuted solid matter charged with nitroglycerine and protected grains of ammonium nitrate, the protecting coating being petroleum or its soft educts, as cosmoline, for which nitroglycerine has no affinity.

333,150—December 29, 1885. R. S. PENNIMAN AND J. C. SCHRADER. *Dynamite.*

An explosive compound composed of composite absorbent grains charged with nitroglycerine, and jacketed grains of an explosive salt.

333,151—December 29, 1885. R. S. PENNIMAN AND J. C. SCHRADER. *Gelatinated explosive.*

Composed of gelatinated nitroglycerine and grains of protected nitrate of ammonia.

333,344—December 29, 1885. J. C. SCHRADER. *Explosive compound.*

Porous-grained dope, embodying in each grain a cellular mass of sulphur and combustible or noncombustible matter (such as vegetable or woody fiber, coal, asbestus, furnace slag, or nitrates), produced, for example, by mixing wood pulp and finely ground sulphur, beating the mass until the sulphur is softened to an adhesive condition, cooling and graining.

333,345—December 29, 1885. J. C. SCHRADER. *Process of making explosive compounds.*

A dry-grained, free-running, high-explosive powder is produced by mixing with combustible ingredients, as wood pulp, powdered sulphur sufficient to adhesively control the mass when melted, heating, cooling, and graining into porous grains, and charging with the liquid explosive not greater than their capacity to receive and retain by capillary attraction.

333,346—December 29, 1885. J. C. SCHRADER. *Dynamite.*

A dry-grained explosive containing nitroglycerine housed and retained within hard cellular grains, composed in whole or in part of a cellular mass of sulphur and fibrous vegetable matter capable of resisting the softening influence of the liquid explosive.

333,347—December 29, 1885. J. C. SCHRADER. *Dynamite.*

An explosive compound containing nitroglycerine housed and retained within hard cellular grains composed in part of particles of solid carbonaceous matter held by a porous structure of suphur; formed, say, by heating a mixture of pulverized bituminous coal, sulphur, and sodium nitrate until the sulphur melts, cooling and graining.

333,348—December 29, 1885. J. C. SCHRADER. *Dynamite and process of making the same.*

A low-grade, dry-grained, free-running powder composed of absorbent grains charged with nitroglycerine and dry combustible uncharged grains.

335,006—January 26, 1886. C. W. A. ZADEK. *Explosive compound.*

A mixture of resinate of calcium or magnesium with trinitro-glycerine.

347,424—August 17, 1886. M. EISSLER. *Dynamite.*

It comprises coated nonabsorbent granules of nitrate salts, nitrocellulose, and nitroglycerine, first chemically amalgamated, and rye flour as a binding agent.

354,345—December 14, 1886. T. PRICE. *Composition for neutralizing fumes of explosives.*

It consists of carbonate of ammonia, urate of ammonia, lime, and sulphate of iron, in equal proportions.

372,330—November 1, 1887. S. D. SMOLIANINOFF. *Dynamite.*

A combination of asbestos, potassium nitrate and potassium chloride, and nitroglycerine.

382,229—May 1, 1888. J. W. GRAYDON. *Explosive charge.*

It consists of a number of rounded pellets, each made of a small portion of explosive inclosed in a flexible envelope impervious to nitroglycerine.

383,420—May 22, 1888. C. W. VOLNEY. *Explosive compound.*

A mixture of charcoal and an oxidant, as sodium nitrate, combined with starch, and forming an absorbent granular powder, with nitroglycerine absorbed by the powder, the granules retaining their granular form.

397,285—February 5, 1889. G. E. F. GRÜNE. *Preparing dynamite.*

Kieselguhr (infusorial earth) is pressed into the form of cartridges, carbonized by heating to a red heat, either with or without the admixture of vegetable or animal carbon, and saturated with nitroglycerine. Water will not expel the nitroglycerine.

398,559—February 26, 1889. J. WAFFEN. *Dynamite.*

It consists of sodium nitrate, 22.5 parts; decayed wood, 36 parts; picric acid, 0.25 part; sulphur, 1 part ;and carbonate of soda, 0.25 part; combined with 40 per cent of nitroglycerine prepared with collodion.

420,626—February 4, 1890. E. JUDSON. *Dynamite.*

A protected powder consisting of a base of nitrate or equivalent gas-producing material, with the grains coated with a paste of barley meal combined with nitroglycerine.

427,679—May 13, 1890. P. GERMAIN. *Dynamite.*

Spongy cellular vegetable tissue, as pith, is compressed and used as an absorbent for nitroglycerine or other liquid explosive; it may be cut into small pieces.

437,499—September 30, 1890. D. MINDELEFF. *Explosive compound.*

A combination of nitro-glycerine, an alcohol, as methyl alcohol, and a soluble explosive, as pyroxyline.

438,816—October 21, 1890. C. O. LUNDHOLM AND J. SAYERS. *Manufacture of explosives.*

Cellulose nitro derivatives are mixed and incorporated with nitroglycerine by suspending or diffusing the ingredients in a liquid that is a nonsolvent, such as water, agitating them together in the liquid, and then separating the liquid.

440,921—November 18, 1890. D. MINDELEFF. *Explosive.*

A compound consisting of ethyl nitrate, methyl nitrate pyroxyline, nitroglycerine, and a nonsensitizing mixture, as nitro-benzene and methyl alcohol.

443,035—December 16, 1890. W. D. BORLAND. *Dynamite.*

Nitroglycerine and carbonized or charred cork.

466,900—January 12, 1892. L. BROWN. *Absorbent of nitro-glycerine.*

A mixture of sodium nitrate, wood pulp, glue, and magnesia.

478,366—July 5, 1892. S. ROGERS. *Explosive compound.*

A mixture of ammonium picrate, 4 parts; ammonium nitrate, 6 parts; and nitroglycerine, 6 parts.

478,844—July 12, 1892. L. BROWN. *Nitro-glycerine blasting-powder.*

A grading and coating mixture, consisting of sodium nitrate, 73 parts; wood pulp, 1 part; sulphur, 12 parts; resin, 11 parts; and paraffine, 3 parts; all by weight.

506,784—October 17, 1893. A. KRANZ. *Dynamite.*

A composition of nitroglycerine, camphor, and gun-cotton dissolved in acetone and sulphuric ether, combined with a composition of linseed oil and oil of turpentine treated with nitrate of ammonia and sulphuric ether.

517,396—March 27, 1894. W. Y. ROCHESTER AND J. McARTHUR. *Dynamite and process of making same.*

A composition of nitroglycerine, whiting, coal, slacked lime, pulverized copperas, sodium nitrate, gum camphor, alcohol, carbonate of ammonia, and water, in specified proportions. It produces no obnoxious gases.

524,776—August 21, 1894. G. J. BUECHERT. *Explosive compound.*

A compound consisting of a protectively coated salt of ammonia, as the sulphate or chloride, and sodium nitrate, with wood pulp and nitroglycerine.

525,188—August 28, 1894. H. A. CALLAHAN. *Dynamite.*

A mixture of nitroglycerine and acetate of lime, with or without pulverized coke.

525,996—September 11, 1894. B. C. PETTINGELL. *Explosive compound.*

Composed of nitroglycerine combined with nitrated coal dust as an absorbent base.

542,724—July 16, 1895. F. G. A. BROBERG. *High explosive.*

It consists essentially of nitroglycerine, nitronaphthalenes, wood-pulp, and sodium nitrate, with or without sulphur or nitro-cellulose.

612,707—October 18, 1898. R. CROWE. *Composition for preventing fumes in mining powders.*

A mixture of unbolted wheat flour, 50 per cent; common salt, 25 per cent; and bicarbonate of soda, 25 per cent; the salt and soda to be finely ground; to be used contiguous to but not mixed with the high explosive.

625,380—May 23, 1899. E. S. CLARK. *Tamping plug and process of and apparatus for making same.*

A new article of manufacture, a tamping plug, designed to neutralize the deleterious fumes of explosives and lessen the heat of the explosion, consists of a perforated cylinder of solid hydrated salt, as mono-carbonate of soda with a small amount of ferric oxide and mono-sulphate of soda, formed by pressing the salt into molds, filling the interstices with a hot saturated solution, cooling and then temporarily heating the mold to form a film of fused salt and admit of the discharge of the block.

644,403—February 27, 1900. E. CALLENBERG. *Explosive.*

It is composed of turpentine oil, 4 parts; collodion cotton, 1 part; and nitroglycerine, 30 parts; heated together to form a gelatine, and mixed with 27 parts of Epsom salts, and 1 part of soda.

647,607—April 17, 1900. R. S. PENNIMAN AND J. C. SCHRADER. *High-explosive compound.*

A mixture of nitroglycerine and a dope containing vulcanized resin—No. 647,606—(homogeneously united resin and sulphur in a pulverized condition).

648,222—April 24, 1900. H. E. STÜRCKE. *Explosive.*

An explosive consisting of an explosive organic nitro compound, as nitroglycerine, an oxygen-consuming absorbent material, ammonium nitrate, and an additional oxidizing material, as sodium nitrate, the oxidizing materials being combined in such proportions that the ammoniun nitrate will furnish from 5 to 20 per cent of the available oxygen.

649,852—May 15, 1900. A. LUCK. *Explosive.*

An explosive containing an explosive organic nitrate, as nitroglycerine and a nonexplosive ester of cellulose, as acetate of cellulose.

SMOKELESS POWDER.

38,789—June 2, 1863. J. F. E. SCHULTZE. *Improved gunpowder.*

Wood grains, formed by punching or cutting veneers, are successively treated to remove acids and easily soluble material, the proteine, albumen, etc., and bleached; then treated with nitric and sulphuric acid mixture, drained, and washed; and finally saturated with a salt or salts containing oxygen and nitrogen, as potassium nitrate with or without barium nitrate. The dust produced is made into a paste, formed into sheets, and then punched or cut into grains and dried, and powder produced therefrom.

89,910—May 11, 1869. O. H. BANDISCH. *Improved explosive compound.*

Schultze gunpowder, No. 38,789, is treated to bath of pure alcohol and ether (one of alcohol to five of ether), dried at 21° to 27° C., and then compressed.

145,403—December 9, 1873. C. DITTMAR. *Improvement in explosive compounds.*

Vegetable fiber is prepared with a solution of sugar, or mannite, or amylum, or inuline, or other described substances, and rendered explosive by nitric acid. The fiber is reduced to a pulp, compressed in a sheet or other compact form, and then reduced to a granulated or powdered condition and treated with acid to render it explosive.

145,403—December 9, 1873. C. DITTMAR. (*Reissues: 5,759—February 10, 1874; 6,645—September 14, 1875.*) *Improvement in explosive compounds.*

Vegetable fiber is converted into a pulp, desiccated and reduced to powder, grains or compact forms, and then treated with nitric or nitric and sulphuric acids. The acid bath may be preceded by a soaking in a starchy or saccharine solution and followed by an alkaline solution. Potassium nitrate or chlorate or nitroglycerine may be added.

179,688—July 11, 1876. C. DITTMAR. *Improvement in explosive compounds.*

An explosive compound having its grains parchmented, whereby they are smooth and nonadhesive, produced by forming grains of vegetable fiber, parchmenting same by sulphuric acid, and then treating with nitric and sulphuric acid bath.

187,155—February 6, 1877. S. J. MACKIE, C. A. FAURE, AND G. FRENCH. *Improvement in explosive compounds.*

It consists of a mixture of nitro cellulose, say 25 parts, reduced to an impalpable powder, nitrate of baryta 18½ parts, and nitrate of potassium 6½ parts.

267,108—November 7, 1882. W. F. REID AND D. JOHNSON. *Hardening explosive granulated powders containing nitro-cellulose, etc.*

The granulated powder is moistened with a spirit, which is then evaporated.

376,000—January 3, 1888. D. JOHNSON. *Process of preparing explosives.*

Dinitro cellulose is incorporated with barium and potassium nitrates and carbon, the mixture treated with a solution of camphor in a volatile liquid not a solvent of dinitro cellulose—such as light petroleum or benzoline—the solvent evaporated at a low temperature, the camphorized material then subjected to a temperature high enough to change the mechanical state of the dinitro cellulose, and finally the camphor expelled.

409,549—August 20, 1889. F. A. ABEL AND J. DEWAR. *Nitro-gelatine explosive.*

Blasting gelatine or compounds thereof is pressed through holes and formed into wires, cut into lengths, and packed in cartridge cases.

411,127—September 17, 1889. H. MAXIM. *Method of producing high explosives.*

Gun-cotton or nitro cellulose is dissolved in a suitable solvent, such as acetone or ethylic acetate, the solution added to nitroglycerine, and the solvent evaporated from the mixture.

423,230—March 11, 1890. S. H. EMMENS. *Explosive.*

It consists of paper or paper stock converted into a nitro compound and impregnated with ammonia and picric acid.

425,648—April 15, 1890. F. A. ABEL AND J. DEWAR. *Gelatinous explosive.*

A gelatinous explosive consisting of nitroglycerine and nitro cellulose to which tannin is added (from 10 to 20 per cent).

429,516—June 3, 1890. R. VON FREEDEN. *Manufacture of gunpowder.*

Nitro cellulose, or a compound thereof with other substances, is gelatinized and granulated by adding a solvent of the nitro cellulose, kneading until it has become plastic and thoroughly gelatinized, and then introducing a liquid or vapor chemically indifferent to the constituents of the mass, as water or steam, and stirring until complete granulation.

430,212—June 17, 1890. H. S. MAXIM. *Manufacture of explosives.*

Gun-cotton is reduced to a pulp, washed and dried, confined in a receiver and the air exhausted therefrom, when the vapor of acetone or its equivalent is admitted to the receiver, and the dissolved gun-cotton is then expelled by pressure.

434,049—August 12, 1890. H. S. MAXIM. *Explosive compound.*

It consists essentially of gun-cotton or pyroxyline mixed with nitroglycerine and an oil such as castor oil; produced by mixing and agitating the same with a proportion of a solvent, such as acetone, insufficient to entirely dissolve the gun-cotton, and subjecting the product in a partial vacuum to the action of vaporized acetone, and then to pressure.

436,898—September 23, 1890. H. S. MAXIM. *Manufacture of explosives.*

Gun-cotton is reduced to pulp, dried, and subjected in a receiver to the action of a vaporized solvent, as acetone, until it is partially dissolved, when it is compressed by a high pressure—20 to 40 tons per square inch—and the sheet cut into pieces or grains.

456,508—July 21, 1891. A. NOBEL. *Celluloid explosive and process of making the same.*

Hard, horny grains, containing nitro cellulose and nitroglycerine, solid at ordinary temperatures; produced by uniting nitro cellulose and nitroglycerine by means of a volatile solvent, as acetone, camphor, or the like—say in the proportions of equal parts of nitro cellulose and nitroglycerine plus camphor—removing the volatile solvent, passing between steam heated rolls, and cutting the sheets into grains.

489,684—January 10, 1893. C. E. MUNROE. *Explosive powder and process of making same.*

It consists wholly of cellulose nitrate of high nitration in a colloidized and indurated condition; produced by first extracting from gun-cotton the lower products of nitration, then mixing and incorporating with it a liquid colloidizing agent capable of converting at ordinary temperatures the higher cellulose nitrates into viscous form, as nitro-benzene, then forming the material into strips or grains, and finally indurating it by the action of heated liquids or vapors, as water or steam, or both.

503,583—August 22, 1893. F. G. & P. S. DU PONT. *Process of making smokeless explosives.*

Nitro cellulose is suspended in a liquid, such as water, which is not a solvent of the same, and in which may be dissolved a suitable salt; granulated by agitating therewith in proper proportions a suitable solvent, as nitro-benzole, not miscible in the suspending liquid, with or without the injection of steam; the grains being hardened and rounded by rotation, and further solidified by rotation in an atmosphere of steam.

503,585—August 22, 1893. F. G. & P. S. DU PONT. *Process of making smokeless powder.*

As a modification of process No. 503,583, the grains are solidified by subjecting them to a heat ranging from 49° to 82° C., to remove the water contained in the grains, but not high enough to vaporize the solvent, and then to a heat sufficient to vaporize the solvent for removal of the excess of solvent.

503,587—August 22, 1893. F. G. DU PONT. *Process of making smokeless explosive.*

Process No. 503,583 is modified by forming an emulsion of the solvent, nitrobenzole, with water in proper proportions, and then adding it to the nitrocellulose suspended in water.

507,279—October 24, 1893. M. E. LEONARD. *Smokeless powder.*

Composed of nitroglycerine, gun-cotton, lycopodium, and a neutralizer of free acid, such as urea crystals or dinitrobenzol, with or without an oil, as cottonseed oil.

513,737—January 30, 1894. E. A. STARKE. *Smokeless powder.*

A combination of an ammonium chromate, potassium picrate, and ammonium picrate.

519,702—May 15, 1894. F. G. DU PONT. *Manufacture of smokeless powder.*

A volatile oil, and preferably a hydrocarbon oil, as benzine, is mixed with the solvent emulsion of processes No. 503,587 and 503,583. The excess of solvent and the oil is removed from the grains by distillation, after hardening.

522,987—July 17, 1894. F. G. DU PONT. *Smokeless explosive.*

Nitro cellulose is suspended in an oil, as hydro-carbon oil; granulated by agitating therewith in suitable proportions a solvent which, though soluble in the suspending oil, has a solvent action on the nitro cellulose, as acetone; the grains hardened by rotation; the excess of solvent removed; and finally the oil removed from the grains.

541,909—July 2, 1895. G. N. WHISTLER AND H. C. ASPINWALL. *Smokeless powder.*

A mixture of nitroglycerine, gun-cotton, a nitrate such as barium nitrate, petrolatum, and urea crystals.

541,910—July 2, 1895. G. N. WHISTLER AND H. C. ASPINWALL. *Smokeless gunpowder.*

Composed of nitroglycerine, trinitrocellulose, a nitrate and a neutralizer of free acid, such as urea crystals, the proportion of nitrate to the trinitrocellulose being about 45 to 100, so that the combustion of the gun cotton shall be substantially similar to that of the nitroglycerine.

541,911—July 2, 1895. G. N. WHISTLER AND H. C. ASPINWALL. *Smokeless powder.*

A compound of nitroglycerine, gun-cotton, a nitrate as barium nitrate, a resin and urea crystals. The fossilized or mineral gum kauri is claimed as a deterrent in a nitroglycerine, gun-cotton, and a nitrate mixture.

542,812—July 16, 1895. J. V. SKOGLUND. *Method of making smokeless powder.*

The drying of grains of powder containing nitrated cellulose is insured by combining with the solvent, water and a vehicle such as alcohol, and dissolving the nitrated cellulose in the liquid, rendering the material porous by the presence of the water as the solvent evaporates.

544,517—August 13, 1895. W. C. PEYTON. *Process and apparatus for making gunpowder.*

The plastic mass is forced through a die and formed into a tube, split, and spread into a flat sheet; passed between grooved rollers and formed into strips or rods connected by films, and then beneath a vertically reciprocating cutter, whereby the strips are cut into grains.

550,472—November 26, 1895. J. B. BERNADOU AND G. A. CONVERSE. *Process of making nitrocellulose powders.*

Two or more nitrocelluloses of known nitration strength are mixed in such proportions as to give a product of desired nitration strength, an oxidizing agent and camphor are added, the mass is colloided with a solvent capable of dissolving the highest form of nitrocellulose present, and it is made into regular forms of uniform least dimension.

552,919—January 14, 1896. H. MAXIM. *Cellular explosive charge.*

An amorphous explosive charge having a multiplicity of interior cells, formed by rolling a sheet of the colloid material, having regular cells or depressions, into a cylinder form. The cells may be filled with granular powder, and the charge exteriorly coated with celluloid or varnish difficult of ignition with respect to the interior of the mass.

559,638—May 5, 1896. M. VON FÖRSTER. *Process of making smokeless powder.*

Flakes having a corrugated or wavy surface are produced by forming a paste of incompletely-gelatinized nitrocellulose into thin bands, cutting these bands into flakes, and rapidly drying the flakes.

568,902—October 6, 1896. F. A. HALSEY. *Smokeless powder.*

A compound of strontium nitrate, ammonium picrate, potassium bichromate and potassium permanganate.

570,705—November 3, 1896. F. A. HALSEY. *Smokeless powder.*

A compound of an ammonium picrate, potassium bichromate, and potassium permanganate.

575,765—January 26, 1897. G. G. ANDRÉ. *Manufacture of gunpowder.*

A compound of dinitro and trinitro cellulose is granulated or reduced to pellets in a wet state, and then subjected to the action of a solvent capable of dissolving the dinitrocellulose only, whereby the trinitrocellulose particles are coated with and cemented together by the dissolved dinitrocellulose, and the granules are then hardened by removal of the solvent.

576,532—February 9, 1897. G. G. ANDRÉ. *Manufacture of gunpowder.*

A base consists of 2 parts of trinitrocellulose and 1 part of dinitrocellulose; the same is combined with nitroglycerine, forming a tough, leathery, and translucent explosive.

583,489—June 1, 1897. H. KOLF. *Process of making smokeless powder.*

A carbohydrate is nitrated, then treated with an alkaline sulphide, then saturated with an alkaline nitrate, then a nitro product as nitro-molasses (or nitro-sugar or nitro-glycerine) is mixed therewith and the compound is converted into a gelatinous body by means of a suitable solvent.

586,586—July 20, 1897. J. B. BERNADOU. *Smokeless powder and process of making same.*

An ether-alcohol colloid of nitrocellulose of substantially uniform nitration, or 12.45 per cent nitrogen and corresponding to the formula $C_{30}H_{38}(NO_2)_{12}O_{25}$, with which nitrates of metallic bases and insoluble nitrocellulose, either or both, may be incorporated. It may be in form of strips or grains. It is insoluble in ethyl alcohol alone, soluble in 3 parts ethyl alcohol and 1 part ethylic ether, and is produced by immersing cellulose in a mixture of nitric and sulphuric acids and heating to between 42° and 46° C., freeing the product from excess of acid by washing and pulping in water below 71° C., dehydrating and washing in excess of alcohol, and then colloiding in a mixture of ethylic alcohol and ethylic ether.

590,931—September 21, 1897. F. G. DU PONT. (*Reissue: 11,651—February 15, 1898.*) *Process of and apparatus for making smokeless powder.*

Wet gun cotton is compressed until of equal porosity throughout, when the water is displaced with alcohol by percolation under pressure, the gun-cotton is compressed until only the alcohol desired to combine with a colloidizing solvent remains, which solvent, such as ether, is then mixed with the alcoholized gun-cotton.

592,485—October 26, 1897. C. W. VOLNEY. *Process of making gunpowder.*

Grains containing trinitrocellulose are given a surface coating of dinitrocellulose by reducing the trinitrocellulose upon such surface to dinitrocellulose by reducing agents, as by the sulphites or hyposulphites of potassium, sodium, or ammonium.

596,324—December 28, 1897. F. A. HALSEY. *Smokeless powder.*

A compound consisting of an alkaline-metal chromate, an alkaline earth metal nitrate, ammonium picrate, an alkaline-metal permanganate, and an alkaline-metal silicate.

597,565—January 18, 1898. C. QUINAN. *Process of making gun cotton.*

An essentially ash-free hydrocellulose is produced by steeping fiber in a bath of heated mineral acid capable of dissolving the mineral matter, washing out the mineral matter with a weak acid bath, and finally heating the same to complete the conversion. It is then pulverized and nitrated.

599,589—February 22, 1898. J. E. BLOMÉN. *Process of making explosives.*

Process consists in dissolving nitro, and nitrohydroxyl, hydrocarbon derivatives, preferably nitronaphthalene, with a volatile organic solvent, such as amyl acetate; then adding to the composite solvent thus obtained cellulose nitrates and an oxidizing agent; and finally drying and granulating the compound.

617,766—January 17, 1899. G. M. PETERS. *Explosive and process of making same.*

A powder composed of pulverized nitrated wood-pulp, 20 per cent; saltpeter, 60 per cent; charcoal, 12 per cent; and brimstone, 8 per cent; produced by separately reducing the ingredients to powder, nitrating, washing, and drying the cellulose dust, mixing the dust of the four ingredients, thoroughly incorporating the mass until it is worked into a single substance, and granulating.

622,777—April 11, 1899. F. H. McGAHIE. *Powder-grain.*

A multiperforated powder grain, designed to have powder partitions of equal thicknesses; as a central perforation and a surrounding concentric row of segmental-shaped perforations.

625,365—May 23, 1899. E. A. G. STREET. *Process of making explosives.*

Pitch or tar, with or without an azo or nitro derivative, is dissolved in oil, while heating the latter, and chlorate powder added while maintaining the solution fluid by heat.

625,682—May 23, 1899. F. W. JONES. *Process of making explosives.*

In the manufacture of a gelatinized smokeless powder of a nitrocellulose base the grains are swelled to regulate rate of combustion by acting on them with an aqueous solution of a nitrocellulose solvent, as a ketone; the same is saturated with any ingredients of the grain soluble therein which would otherwise dissolve out of the powder.

625,684—May 23, 1899. J. KARSTAIRS. *Explosive and method of making same.*

A compound, $CH_3N_3O_5$, consisting of a crystalline body soluble in water, sp. gr. 1.8, produced by slowly nitrating a mixture of urea and alcohol. It is combined with gum to form a protecting coating, and with nitrated cellulose.

625,685—May 23, 1889. J. KARSTAIRS. *Explosive.*

The combination of a chlorate with the crystalline body $CH_3N_3O_5$ (No. 625,684), the latter having a protective coating.

625,908—May 30, 1899. E. A. G. STREET. *Explosive and method of making same.*

A compound of a chlorate powder mixed with a solution of a nitric ether, as nitroglycerine, an analogous combustible substance wherein the former is soluble, as nitronaphthaline, and an oil derived from organic substance, as castor oil; produced by forming at an elevated temperature a solution of the nitroglycerine, nitronaphthaline, and castor oil, and adding thereto the chlorate powder.

627,436—June 20, 1899. A. MOFFATT. *Process of making nitro-explosives.*

Nitrate of starch is produced by drying until practically free from moisture, cooling, nitrating in a bath at or below 4° C., diluting the mixture with water sufficient to lower its sp. gr. to below 1.30, washing, neutralizing, and drying, whereby the product consists of unruptured granules, and its stability is insured.

633,611—September 26, 1899. F. G. & F. I. DU PONT. *Process of making explosives.*

Alcohol is mixed with nitrocellulose (displacing the water of wet cotton by percolation), and a solution of nitroglycerine in ether is then mixed with the alcoholized nitrocellulose.

640,213—January 2, 1900. H. MAXIM AND R. C. SCHUPPHAUS. *Process of making smokeless powder.*

Pyroxyline, preferably of varying degrees of nitration, pulped or reduced to a fine state of division, is treated with a solvent, and before it is completely freed from the solvent it is treated with a size, and then granulated and dried.

648,147—April 24, 1900. F. I. DU PONT. *Process of making gun-cotton.*

Acid is removed from gun-cotton by applying pressure, and then, while under pressure, replacing the acid with water by percolation, which, in turn, may be replaced with an alkaline fluid by percolation.

652,455—June 26, 1900. J. B. BERNADOU. *Process of making smokeless powder.*

A colloid powder is formed by subjecting soluble nitrocellulose and a colloiding agent, as ether, in a closed vessel to a temperature equal to or below that of freezing water, mechanically agitating or kneading the cooled mixture, and then forming it into shapes and drying.

652,505—June 26, 1900. J. B. BERNADOU. *Smokeless powder.*

An ether colloid of ether-alcohol-soluble nitrocellulose of high nitration; produced by immersing ether-alcohol-soluble nitrocellulose in ethyl ether and exposing to a temperature of 0° C, or lower.

654,471—July 24, 1900. H. S. MAXIM. *Powder-grain.*

A nitro-compound explosive block or tablet (in part of a slow-burning and in part of a quick-burning character), has concentric annular depressions in each face, with tapered cavities in the walls, the cavities on opposite sides breaking joint.

NITRO-SUBSTITUTION COMPOUNDS.

76,173—March 31, 1868. G. DESIGNOBLE AND J. CASTHELAZ. *Improvement in explosive-powders.*

The use of picrate or carbazotate of potassa, as well as the salts formed from picric or carbazotic acid, the derivatives from such acid, and the acid itself, is claimed in the manufacture of powder; as 55 parts of carbazotate of potassa with 45 parts of azotate of potassa, for the greatest effect.

96,248—October 26, 1869. W. MILLS. *Improved explosive compound.*

The use of carbolic acid and aloes in explosive compounds; and an explosive formed of carbolic acid, nitric acid, potassa, and aloes.

112,163—February 28, 1871. W. MILLS. *Improvement in explosive compounds.*

"Oxidized carbolic acid," a wax-like product, produced by treating carbolic or cresylic acid with nitric acid, alone or combined with metal or metallic or earthy oxides or their carbonates, also with sawdust or other ligneous substances treated with niter. Combined with alcohol, spirits, or ether, and metal or metallic oxides it forms an explosive varnish.

124,397—March 5, 1872. C. W. VOLNEY. *Improvement in explosive compounds.*

A mixture of nitroglycerine and nitrotoluol or nitrobenzole, as by dissolving 3 parts of nitrotoluol in 7 parts of nitroglycerine.

178,277—June 6, 1876. A. DIECKERHOFF. *Improvement in explosive compounds.*

It is composed of sawdust which has been saturated with a solution of picric acid and potassium nitrate dissolved in boiling water and then desiccated, mixed with potassium nitrate, sodium nitrate, and sulphur. It is granulated while damp or formed into sticks.

215,199—May 6, 1879. A. DIECKERHOFF. *Improvement in explosive compounds.*

It consists of gunpowder, or the essential elements thereof—the charcoal not being essential—mixed with a small proportion (not over 15 per cent) of a precipitated alkaline picrate or picrates.

216,949—July 1, 1879. C. FELHOEN. *Improvement in blasting powder.*

A composition of niter, sulphur, and charcoal, in the usual proportions of gunpowder, mixed with nitro-naphthaline; 10 per cent or more should be used.

232,381—September 21, 1880. M. TSCHIRNER. *Explosive compound.*

It consists of picric acid and potassium chlorate, say in the proportion of 57 parts of the former to 43 of the latter. They are incorporated with the aid of 5 per cent of resin dissolved in a volatile solvent.

243,432—June 28, 1881. S. R. DIVINE. *Explosive compound.*

It consists of a solid ingredient, such as potassium chlorate, 3 to $4\frac{1}{2}$ parts, and a liquid ingredient, such as nitro-benzole, 1 part, mechanically united.

263,824—September 5, 1882. E. TURPIN. *Explosive compound.*

A compound of peroxide of nitrogen or hyponitric anhydride with sulphuret of carbon, or its equivalent. If slowly ignited it produces an intense light, without explosion, and the flame instantly melts platinum.

289,755—December 4, 1883. S. R. DIVINE. *Process of preparing explosive compounds.*

An explosive composed of two ingredients, one a solid—such as potassium chlorate—and the other a liquid—such as nitro-benzole—is prepared by saturating the powdered potassium chlorate with a mixture of the nitro-benzole and a volatile fluid, such as carbon bisulphide, and then allowing the volatile fluid to evaporate; the proportions being such as to give the proper proportion of nitro-benzole for the mass.

289,757—December 4, 1883. S. R. DIVINE. *Explosive compound.*

From 1 to 3 per cent of sulphur is combined with the moist mass of No. 243,432 (potassium chlorate and nitro-benzene).

289,758—December 4, 1883. S. R. DIVINE. *Explosive compound.*

It is composed of a solid ingredient—4 or 5 parts—such as potassium chlorate, and a liquid ingredient—1 part—consisting of a mixture of nitro-benzole and dead-oil, the latter being mixed in about equal proportions.

289,763—December 4, 1883. S. R. DIVINE. *Explosive compound.*

From 1 to 3 per cent of sulphur is combined with the moist mass of No. 289,758 (potassium chlorate with nitro-benzole and dead-oil).

374,921—December 20, 1887. G. ANTHEUNIS. *Blasting powder.*

It consists of mahogany sawdust, 8 per cent; potassium nitrate, 50 per cent; sodium nitrate, 16 per cent; charcoal, 1.5 per cent; sublimated sulphur, 18 per cent; potassium ferrocyanide, 3 per cent; and ammonium picrate, 3.5 per cent. (Potassium nitrate is omitted in the claim.)

375,651—December 27, 1887. C. ROTH. *Explosive.*

The combination of a chlornitro-hydrocarburet of the aromatic series, as chlornitro-benzol, with an oxidant, such as ammonium nitrate.

376,145—January 10, 1888. S. H. EMMENS. *Explosive derived from phenol.*

A crystalline acid compound is produced by the action of heated concentrated or fuming nitric acid, of sp. gr. 1.52 or higher, upon picric acid in excess, and the crystallization of the liquid. Explosive compositions or pastes are produced by dissolving 2 parts of the same in 1 part of concentrated nitric acid.

403,749—May 21, 1889. J. A. HALBMAYR. *Manufacturing explosives.*

In the manufacture of explosives from tar oils the oils are introduced in a state of division below the surface of a body of nitrating acid, as by a perforated pipe, and cold air under pressure is introduced at the same point, to cool the liquid.

417,429—December 17, 1889. W. E. LIARDÊT. *Manufacture of explosives.*

In the manufacture of explosives containing picric acid and potassium nitrate, or its equivalents, the picric acid is mixed with boiling-hot glycerine, potassium nitrate is added and the mixture cooled, ground wood is then added to the cooled mass, boiling-hot potassium nitrate is added to the mixture, and finally flowers of sulphur.

421,662—February 18, 1890. B. BRONCS. *Explosive compound.*

It is composed of a double salt combination of sodium picrate with other picrates (No. 421,753), potassium nitrate, saccharine matter, a gummy or resinous substance, and soot, with or without nitrated naphthaline.

421,753—February 18, 1890. B. BRONCS, H. ORTH, ADM'R. *Explosive compound.*

A double picrate consisting of sodium picrate combined with barium or lead picrate.

422,514—March 4, 1890. S. H. EMMENS. *Manufacture of explosives.*

A suitable hydrocarbon substitution derivative, as trinitrophenol, is fused; a suitable alkaline nitrate, as sodium nitrate, is added thereto; and the heat gently raised until actual liquefaction of the mixture is attained, when it is allowed to cool.

422,515—March 4, 1890. S. H. EMMENS. *Manufacture of explosives.*

The crystalline acid of No. 376,145 is heated with an allied nitro-hydrocarbon, as dinitrobenzene, which reduces the fusing point of the acid; a pulverized oxidant is then mixed therewith, and the mixture is cooled.

435,142—September 2, 1890. C. LAMM. *Manufacturing explosive charges.*

Pulverized partially-fusible explosive material is introduced, into molds surrounded by a heating chamber, then a heating medium is passed through said chamber to melt the contents of the molds, then cold water is passed through said chamber to solidify the explosive material, and finally the charges or cartridges are ejected.

455,217—June 30, 1891. C. LAMM. *Explosive compound.*

Composed of a nitrate salt, as ammonium nitrate, and dinitro-benzene or dinitro-benzol.

478,819—July 12, 1892. A. C. RAND. *Explosive compound.*

It consists of an oxidant, as chlorate of potash, in a powdered form, and manganese peroxide in the form of coarse grains mixed with the oxidant, say equal parts, and a fluid hydrocarbon, as nitro benzol, say 15 per cent by weight, incorporated therewith.

488,534—December 27, 1892. J. F. ALEXANDER. *Explosive.*

A powder composed of naphthaline or a suitable solid hydrocarbon, sulphur, a potassium salt or salts, and ammonium picrate, with or without ammonium sulphate.

492,089—February 21, 1893. B. LEPSIUS. *Preparing explosive compounds.*

A mixture of picric acid and an enveloping explosive agent, such as tri-nitro-toluol, is heated, in a mold, to a point above the fusing point of the latter ingredient and below that of the former—to avoid fusing the crystals of the acid—and then cooled, thus cementing the crystals together.

495,178—April 11, 1893. J. E. BLOMÉN. *Method of making blasting compounds.*

Picric acid and a hydrocarbon, as naphthalene, are separately dissolved in alcohol, the solutions mixed, and the resulting picrated hydrocarbon dissolved in nitroglycerine.

506,031—October 3, 1893. J. E. BLOMÉN. *Manufacture of blasting compounds.*

A hydrocarbon is first treated with nitric acid; the product is then treated with a mixture of nitric and sulphuric acids, and this second product is then treated with strong nitric acid, and finally incorporated with an oxidizing agent.

506,032—October 3, 1893. J. E. BLOMÉN. *Blasting compound.*

The granules of an oxidizing agent have a coating composed of a mixture of a hydrocarbon and dinitro-phenol.

521,020—June 5, 1894. W. EVELYN-LIARDÊT. *Explosive and process of making same.*

A mixture of tar, picric acid, sawdust, the chloride and the perchlorate of an alkali metal; produced by heating the tar to 120° C., adding the picric acid, gradually adding the sawdust, heating the mixture to about 100° C., cooling and passing through a sieve, adding to the sifted product a suitable mixture of the perchlorate and chloride of an alkali metal, at the same time heating the mass until it assumes a black color, cooling and granulating.

527,563—October 16, 1894. E. A. STARKE. *Process of making ammonium bichromate.*

A solution of ammonium picrate and a solution of potassium bichromate are mixed, through which crystals of potassium picrate form, which are removed, leaving an ammonium bichromate solution that is evaporated to dryness. An explosive compound is formed by mixing the solutions in proper proportions, ammonium picrate being in excess, and evaporating the resultant mixture of ammonium picrate, ammonium bichromate, and potassium picrate to dryness.

530,063—November 27, 1894. J. E. BLOMÉN. *High-power explosives.*

A mixture of nitro-naphthalenes, an oxidizing agent, a mixture of nitrophenols, sulphur, and charcoal.

540,141—May 28, 1895. F. G. A. BROBERG. *Explosive compound.*

A composition of nitro-resin, say, 6 to 10 per cent; nitro-naphthalenes, 5 to 10 per cent; sulphur, 14 or 15 per cent; and an oxidizing agent, such as sodium nitrate, 70 per cent.

540,647—June 11, 1895. S. R. DIVINE. *Explosive compound.*

It is composed of nitrate of lead and a nitrated hydrocarbon of the benzol series, which is of itself nonexplosive, such as dinitro-benzol; 1 part of the latter is melted and 4 parts of the former is mixed therewith.

567,536—September 8, 1896. E. DICKSON. *Gunpowder.*

It consists of a granulated mixture of barium nitrate, flour, potassium ferrocyanide, picric acid, ammonia, potassium chlorate, and lampblack, coated with refined petroleum which has been treated with nitric acid, sulphuric acid, and ammonia.

577,351—February 16, 1897. H. BOYD. *Explosive.*

A mixture of potassium nitrate, sulphur, barium nitrate, picric acid, wood-dust, and a fume absorbent, such as dry pulverized bog ore or other hydrated oxide of iron; characterized by firing without a detonator and absorbing the noxious gases.

594,268—November 23, 1897. F. MÜLLER, S. OBERLÄNDER, V. H. FUCHS, AND S. GOMPERZ. *Blasting powder and process of making same.*

A compound composed of picrate combined with sulphur, nitrate of potassium, and a carrier, such as nitrated cellulose, with or without a substance yielding free oxygen, such as pyrolusite. The process consists in mixing sulphur and carbolic acid; also mixing nitrate of potassium and nitric acid, and then combining the two mixtures and neutralizing with an alkali.

598,064—January 25, 1898. W. P. FERGUSON. *Blasting compound.*

In a granular blasting compound in which the oxidizing agent is coated with a film containing a nitrophenol and a hydrocarbon, lampblack is intermixed with the elements of the film.

598,618—February 8, 1898. E. A. G. STREET. *Explosive and method of making same.*

The combustible agent, such as nitro or azo derivative, or combination thereof, is mixed with an oil at an elevated temperature which is not a solvent thereof at ordinary temperature in such proportion that on cooling it assumes a pasty or solid consistence, and the chlorate powder is mixed therewith, the fluidity being maintained during maxilation. The combustible element is composed of a solution in oil of a less soluble combustible body, such as picric acid, combined with a more soluble body of the same class.

622,800—April 11, 1899. G. M. HATHAWAY. *Detonating compound.*

It is composed of the ingredients of gunpowder with nitronaphthalene, nitrophenol, sodium nitrate, and potassium chlorate, combined in such proportions as to form a detonating compound of low grade.

622,990—April 11, 1899. H. BOYD. *Blasting powder.*

A fumeless explosive, consisting of sodium nitrate, sulphur, picrate of ammonia, and potassium bichromate, with or without commercial lime, cottonseed oil, and peat dust, one or all of them.

625,499—May 23, 1899. F. A. HALSEY. *Gunpowder.*

It consists of picrate of ammonia, 47 per cent; potassium bichromate, 23 per cent, and barium nitrate, 30 per cent.

649,913—May 22, 1900. S. CLARK. *Explosive compound.*

A mixture of sodium nitrate, 19 parts; antimony, $2\frac{1}{2}$ parts; sulphur, 3 parts; charcoal or coke, $3\frac{1}{2}$ parts; picric acid, one-third part; nitric acid, one-third part, and a reducer, such as resin, one-half part.

FULMINATES, PRIMING COMPOSITIONS, AND FUSES.

August 21, 1834. S. GUTHRIE. *Improvement in the manufacture of percussion powder.*

Grains of powder are coated with shellac and before they are dry they are rolled in leaf metal, or any of the metallic powders, with bisulphuret of tin or other metal or metallic compound. After coating they may be again coated with a waterproof varnish.

18,016—August 18, 1857. M. KLING. *Improvement in percussion powder.*

A mixture of antimony, 1 ounce; and potassium chlorate, 1 ounce, with equal proportions of glue dissolved in boiling water, and oxalic acid dissolved in boiling water.

18,199—September 15, 1857. E. GOMEZ AND W. MILLS. *Improvement in safety-fuse compositions.*

A mixture of equal parts of potassium chlorate and ferrocyanide of lead. It is mixed with alcohol and applied as a paint to a strip of paper, and protected by a winding of tape of fibrous material.

35,477—June 3, 1862. F. M. RUSCHHAUPT AND J. SCHULTE. *Improved percussion powder.*

Tannin or pyrogallic acid, or analogous substances, are mixed in chemical proportions with potassium chlorate, a varnish being added as a binder.

38,424—May 5, 1863. L. SHORT. *Improved composition for filling shells.*

A mixture of saltpeter, 7 pounds; asphaltum, 6 pounds; antimony, 2 pounds; sulphur, 7 pounds; and naphtha, 2 gallons, is allowed to stand and settle, and the sediment is pressed into shells, forming combustible missiles to be used with explosive projectiles. The liquid combined with vegetable fiber is also packed in explosive shells.

38,994—June 23, 1863. I. P. TICE. *Improvement in concussion fuse for shells.*

An admixture of fulminates with cotton, gun cotton, wool, sawdust, or other soft material, prevents premature ignition, or the fulminate chamber is lined with soft material. Two fulminates are used, one sensitive and easily ignited and the other burning slower and with a stronger flame. The percussion-fuse plug is of special construction.

41,259—January 12, 1864. H. HOCHSTÄTTER. *Improved composition for percussion caps, etc.*

Chloride of lead, 12 parts, is combined with potassium nitrate, 8 parts, and gum amber, 3 parts.

47,677—May 9, 1865. J. S. BICKFORD. *Improved fuse for blasting, etc.*

A central strand or core of gun-cotton is used in a fuse as a substitute for gunpowder.

48,460—June 27, 1865. H. B. STOCKWELL. *Improved fulminating compound.*

A mixture of fulminating mercury, 4 parts; saltpeter, 3 parts; black sulphuret of antimony, 2 parts; and French chalk, 1 part.

49,474—August 15, 1865. H. HOLDEN. *Improved torpedo.*

A sheet of absorbent paper saturated wholly or in part with a solution of fulminate of silver or of mercury.

56,167—July 10, 1866. G. BOLDT. *Improved fulminating composition.*

Fifteen parts of fulminating silver—formed by dissolving 1 part of mercury, in weight, in 10 parts of nitric acid, then boiling with 12 parts of alcohol, cooling and drying—is mixed with 1½ parts of sulphur-tin—formed by melting together 2 parts of sulphur and 3 parts of tin—and 3 parts of flour and 1 part of powdered charcoal, with a little gum water.

67,714—August 13, 1867. H. BUCHNER AND F. EBERTZ. *Improved fulminating powder for needle-guns.*

A mixture of potassium chloride, sulphur, charcoal, saltpeter, potassium chlorate, antimony, and gum, in about equal proportions.

69,206—September 24, 1867. J. GOLDMARK. *Improved fulminating compound.*

The sulphocyanite of a metal or other base, as the sulphocyanite of lead, is used in combination with potassium chlorate, either with or without other substances.

81,036—August 11, 1868. C. H. F. THIEME. *Improved priming for needle-guns.*

A composition having hyposulphite of any metal as a base, as a mixture of hyposulphite of silver or lead, 1 part; sulphureted antimony, 4 parts; potassium chloride, 10 parts; sulphur, 3 parts; and white sugar one-fourth part.

81,057—August 11, 1868. B. BURTON. *Improvement in the manufacture of water-proof percussion caps, etc.*

Shellac or other gum resin, mixed with alcohol or other readily evaporable solvent, is used in the compounding of fulminating matter.

93,113—July 27, 1869. G. M. MOWBRAY. *Improved method of exploding nitro-glycerine.*

An electrical fuse is composed of a priming composition, inclosing circuit wires at their point of interruption, in combination with an intermediate priming charge of fulminate of mercury, all inclosed in a cylinder.

96,465—November 2, 1869. G. M. MOWBRAY. *Improved compound for priming electric fuses.*

A mixture of phosphorus, sulphur, silver, mercury, and potassium chlorate; so as to form a mixture of subphosphide of silver with subsulphide of silver and potassium chloride, to which is added sulphide of mercury.

97,843—December 14, 1869. R. WHITE. *Improvement in metallic cartridges.*

The fulminate powder is mixed with india rubber or similar elastic substance. The structure of the cup is claimed.

103,931—June 7, 1870. W. H. ROGERS. *Improved fuse composition.*

A composition of powdered charcoal, 20 parts; powdered glass, 10 parts; potassium chlorate, 10 parts; and dissolved india rubber, 30 parts; with sufficient bisulphide of carbon to impart a tough and waxy character.

128,241—June 25, 1872. G. M. MOWBRAY. *Improvement in compounds for priming electric fuses.*

A mixture of mercuric sulphide, amorphous or crystalline—preferably the crystalline—3 parts, and potassium chlorate, 1 part.

139,192—May 20, 1873. E. A. L. ROBERTS. *Improvement in treating explosive compounds to render them safe for blasting and other purposes.*

Explosives, such as fulminates, are combined with water or other liquid, or with a hygrometric salt, so as to form a paste. Moist compounds are exploded by igniting near them or in contact a fulminating or detonating material. Moist or wet compounds are combined in the same charge with dry powder capable of being exploded by a spark or with percussion powder.

152,790—July 7, 1874. C. A. & I. S. BROWNE. (*Reissue: 6,664—July 27, 1875.*) *Improvement in explosive compounds.*

An electrically explosive compound, consisting of pulverized fulminate of mercury intermixed with particles of metal, as antimony, with or without antimonic sulphide or other ingredients.

157,866—December 15, 1874. I. M. MILBANK. *Improvement in explosive compounds.*

A fulminating compound of potassium chlorate, 80 parts; charcoal, 35 parts; and red phosphorus, 4½ parts.

157,857—December 15, 1874. I. M. MILBANK. *Improvement in explosive compounds.*

A fulminating compound of potassium chlorate, 20 parts; prussiate of potash, 10 parts; and red phosphorus, 1 part.

161,430—March 30, 1875. G. M. MOWBRAY. *Improvement in primings for electric fuses.*

A composition of metallic antimony and fulminate of mercury, as a priming for electric fuses.

161,431—March 30, 1875. G. M. MOWBRAY. *Improvement in primings for electric fuses, etc.*

A composition of bismuth and fulminate of mercury.

161,432—March 30, 1875. G. M. MOWBRAY. *Improvement in primings for electric blastings, etc.*

A composition of cadmium and fulminate of mercury; being a mixture of the double-salt mercuric fulminate of cadmium, with an amalgam of mercury and cadmium.

170,066—November 16, 1875. H. J. DETWILLER. *Improvement in explosive compounds.*

A detonating compound consisting of ground bark or sawdust, 5 parts; potassium chlorate, 10 parts; and red phosphorus, 1 part. (Especially adapted for railroad-torpedoes.)

179,067—June 20, 1876. J. D. & W. C. SCHOOLEY. *Improvement in detonating compounds.*

A mixture of potassium chlorate, 3 parts; sulphur, 1 part; and broken glass, 1 part. (For railroad torpedoes.)

184,043—November 7, 1876. W. A. LEONARD. *Improvement in continuous fuse.*

Formed of xylonite, coated with a match composition. (To be used from an air-tight case.)

217,534—July 15, 1879. E. S. HUNT. *Improvement in pyrotechnic cartridges.*

A star having a drop of fulminate secured to its base by shellac dissolved in alcohol. The structure of the cartridge is claimed.

228,935—June 15, 1880. J. A. ROBINSON AND R. H. DIMOCK. *Deflagrating compound.*

Amorphous phosphorus combined with plumbic plumbate and potassium chlorate, produced by mixing, the amorphous phosphorus with sufficient hot water to render the whole mixture of a fluid consistency, adding plumbic plumbate in small quantities with stirring till effervescence ceases, and then adding potassium chlorate in quantity equal to that of the amorphous phosphorus, and thoroughly mixing.

233,406—October 19, 1880. C. A. FAURE AND G. TRENCH. *Detonator.*

A detonating compound of fulminate of mercury, 6 parts, and gun cotton and potassium chlorate, each 1 part.

261,247—July 18, 1882. J. F. A. MUMM. *Compound for railway-signal torpedoes.*

A compound composed of potassium chlorate, gum tragacanth, alcohol, antimony, sulphur auratum antimonii, or golden sulphuret, sublimed sulphur, and French chalk, in the form of pellets or cakes, with packages of gravel interspersed.

269,769—December 26, 1882. A. WOEBER. *Fulminate.*

A mixture of potassium chlorate, 1 pound; washed flowers of sulphur, one-half pound; amorphous phosphorus, 2 ounces; and 12 fluid ounces of dissolved gum tragacanth.

309,441—December 16, 1884. J. C. DE CASTRO. *Explosive compound.*

Bran or other suitable form of cellulose—7 parts—is mixed with tersulphide of antimony, or natural sulphide of antimony—1 part—to which is added a saturated solution of potassium chlorate, and the whole formed into pellets or grains.

418,552—December 31, 1889. P. BUTLER. *Gunpowder.*

A mixture of fulminate of mercury, pulverized soapstone, and a suitable binding material, as black gunpowder.

489,761—January 10, 1893. S. RODGERS. *Detonating compound.*

It consists of potassium picrate, 43 per cent; potassium chlorate, 43 per cent; extract of logwood, 12 per cent; and a gallotannic ink, 2 per cent.

529,334—November 13, 1894. H. MAXIM. *Fulminating compound.*

A pliable, yielding, or elastic explosive, consisting of a fulminate with its particles agglutinated by a dissolved organic nitro compound, as pyroxyline, with or without nitroglycerine, or a deterring agent to lessen its sensitiveness to detonation.

634,716—October 10, 1899. G. P. BICKFORD-SMITH. *Composition for detonators.*

A composition of sodium tungstate, 4 parts; precipitated copper, 2 parts; strontium nitrate, 4 parts; antimony sulphide, 96 parts; precipitated silver, 108 parts; potassium chlorate, 192 parts; and electrotype plumbago, 20 parts.

PYROTECHNIC COMPOSITIONS.

39,746—September 1, 1863. J. P. PERRY. *Improved composition for explosive shells.*

A liquid shell-mixture formed of powdered sulphur, alcohol, and turpentine, used alone or with cotton or other fibrous matter. (The shell has a separate bursting charge.)

41,577—February 9, 1864. E. HARRISON. *Improved inflammable composition for filling projectiles.*

A mixture of gunpowder, amorphous phosphorus, and bisulphide of carbon; forming a thick paste or solid mass.

42,458—April 26, 1864. A. BERNEY. *Improvement in destroying forts, etc., by means of inflammable liquids.*

An inflammable liquid is to be projected by a hose and pump, the jet being ignited at the nozzle.

47,335—April 18, 1865. C. W. ROESLING. *Improved powder for lighting cigars, etc.*

A mixture of potash, 40 parts; burned alum, 30 parts; powdered charcoal, 20 parts; and rye flour, 10 parts, is heated in a closed cylinder to a red heat, then cooled and maintained dry. It ignites by simply breathing on it.

48,187—June 13, 1865. H. W. LIBBEY. *Improved incendiary compound.*

Powdered potassium nitrate, 1½ ounces, and spirits of turpentine, 1 ounce, are added to a mixture of nitric acid, 2 ounces; barium sulphate, one-fourth ounce; and sulphuric ether, 1½ ounces. After standing, the oily substance is treated with alcohol; and hydrocarbon oil, 1 ounce, and tar, one-half ounce, are added; and combustible fibrous material is saturated with the compound.

65,764—June 11, 1867. C. NELSON. *Improved toy torpedo and explosive compound.*

The explosive composition consists of amorphous phosphorus, one-third; potassium chlorate, one-third; sulphur, one-sixth; and pulverized chalk, one-sixth.

144,030—October 28, 1873. A. LAMARRE. *Improvement in pyrotechnic signals.*

Linseed-glue, produced by reducing linseed oil to one-half its volume, by evaporation or burning, is mixed with the chlorates and other chemicals.

309,948—December 30, 1884. J. HERZOG. *Colored-fire compound.*

Sawdust dyed to the color the fire will produce is mixed with the chemical ingredients.

323,662—August 4, 1885. C. GERHARD. *Composition for bengal lights.*

A mixture of strontium nitrate and chlorate, potassium chlorate, powdered glass, and flour, with an alcoholic solution of a resinous substance, such as shellac or resin, or a mixture of the two.

363,224—May 17, 1887. C. GERHARD. *Composition for bengal lights.*

A mixture of strontium nitrate or chlorate, 24 pounds, and shellac, 7 pounds, melted, mixed, and cooled, is pulverized, added to a solution of glue and gum, and 4 pounds of potassium chlorate is added to the paste thus formed.

384,927—June 19, 1888. H. G. PIFFARD. *Photogenic powder.*

It consists of magnesium powder intimately mixed with "wood powder" (Dittmar, No. 145,403), or similar nitro-lignin equivalent.

407,351—July 23, 1889. A. HEMSLEY. *Compound for producing flash-light.*

It consists of powdered or granulated metallic magnesium, one or more nitrates, and amorphous phosphorus.

411,714—September 24, 1889. A. DEL GRANDE. *Preparing pyrotechnic compounds.*

Picric acid is dissolved in hot water and magnesium carbonate added to form a solution of magnesium picrate; then potassium nitrate is dissolved in water and the two solutions mingled, producing a precipitate of potassium picrate ($C_6H_2(NO_2)_3OK$), which is reduced to a granular condition and dried.

415,479—November 19, 1889. J. G. STUTZ. *Colored fire.*

A mixture of potassium chlorate, gum-shellac, gum-camphor (pulverized), brass filings, and magnesia, with or without strontium nitrate.

420,642—February 4, 1890. H. O. FRANK. *Solidifying colored fire.*

Pyrotechnic powders are converted into solid form by adding a small quantity of alcohol to the powdered ingredients and mixing the whole in a water bath, at about 93° C., and while still warm pressing the pasty mass into molds coated with vaseline, and cooling.

449,530—March 31, 1891. C. GERHARD. *Bengal-light compound.*

It consists of copal, ether, alcohol, strontium nitrate, and potassium chlorate, with or without a shellac solution or varnish.

475,897—May 31, 1892. C. SCHMIDT. *Fireworks.*

A composition for making star fireworks, consisting of steel chips, charcoal, lead nitrate, shellac, and spirits.

476,264—June 7, 1892. E. HACKH. *Magnesium-light composition.*

Fibrous material, as long carded unspun wool, is impregnated with vegetable oil, 2 parts; benzine, 2 parts and Venice turpentine 1 part, and sprinkled with magnesium powder.

523,614—July 24, 1894. J. AGOSTINI. *Pyrotechnic compound.*

A composition produced by mixing powdered magnesium and charcoal with starch, rendering the mixture adhesive, coating iron filings with a substance impervious to moisture, and adding them to the mixture.

528,515—October 30, 1894. A. HEMSLEY. *Flash-light compound.*

A mixture of aluminum, a nitrate or nitrates of the metals or alkaline earths, and amorphous phosphorus.

534,557—February 19, 1895. C. GERHARD. *Pyrotechnic compound.*

A mixture produced by dissolving camphor in alcohol, mixing lampblack therewith, adding gum tragacanth and glue, and mixing into these ingredients magnesium, starch, and iron.

535,495—March 12, 1895. J. GRAHAM. *Pyrotechnic compound.*

A mixture of powdered zinc, 320 grains; powdered selenium, 80 grains; in one gallon of carbon disulphide.

590,231—September 21, 1897. E. LEUSMANN. *Pyrotechnic compound.*

A compound for Bengal lights, consisting of an alcoholic solution of shellac, a nitrate of a metal of the alkaline earths, pulverized aluminum, sulphur, an alkaline chlorate—as potassium chlorate—and a binding agent.

594,594—November 30, 1897. J. A. BOSTWICK. *Flash-light composition.*

A sheet of collodion has combined therewith powdered flash-light material to produce an actinic light of brief duration and large area. A layer of powder may be applied between two collodion films.

633,671—September 26, 1899. Z. VALDEZ. *Toy torpedo.*

A ball of clay has a coating of gum-shellac; a coating composed of gum-arabic, 4 parts; phosphorus, 4 parts; and potassium chlorate, 5 parts; and an outer coating of shellac.

MATCH COMPOSITIONS.

1,413—November 16, 1839. J. H. STEVENS. *Improvement in the composition of matter for friction-matches.*

A combination of litharge and the red oxide of lead, or either of them separately, with carbonate of lead, phosphorus, and a glutinous or viscid material, such as gum-arabic, or with black oxide of manganese, phosphorus, and the glutinous material.

1,414—November 16, 1839. J. H. STEVENS. *Improved friction-match for retaining fire, entitled "Stevens' fusee cigar-light."*

The match splint is saturated with a solution of saltpeter, dried, and the phosphoric composition is then applied to the end, without the intervention of brimstone.

2,402—December 23, 1841. N. T. WINANS, T. & T. HYATT. *Improvement in the composition of matter for the manufacture of friction-matches.*

Phosphorus, alone or in connection with other inflammables, is combined with glue or gum rendered damp-proof by being chemically united with shellac.

2,403—December 23, 1841. N. T. WINANS, T. & T. HYATT. *Improvement in the composition of matter for the manufacture of friction-matches.*

Shellac, 3 parts, and borax, three-fourths of a part—or like alkali—is dissolved in water, and three-fourths of a part of phosphorus is combined therewith.

2,494—March 18, 1842. S. BLAISDELL. *Improvement in ignitible compounds for friction-matches.*

The matches are dipped into a compound of sulphur and phosphorus formed into a paste with glue.

2,635—May 20, 1842. G. W. CARLETON. *Improvement in friction-matches.*

A paste formed of phosphorus, gum-arabic, or glue, and a fulminating compound composed of subcarbonate of potassa, 2 parts; nitrate of potassa, 3 parts; and sulphur, 1 part.

3,773—October 3, 1844. E. SMITH. *Improvement in friction-matches.*

Pulverized dried vegetable material, as bark, or nutgalls, is mixed with phosphorus, in place of mineral or earthy substances.

40,259—October 13, 1863. J. W. HJERPE. *Improvement in the manufacture of friction-matches.*

A safety match composition (not using phosphorus or other dangerous substance), igniting only on a prepared rubber composition, consisting preferably of potassium chlorate, 4 pounds; potassium chromate, 4 pounds; specular iron or colcothar, 2 pounds; and gum, 2 pounds. Rubber compound therefor, sulphuret of antimony, 20 pounds; potassium chromate, 2 pounds; red iron oxide or colcothar, 6 pounds; protosulphate of iron, 3 pounds; and gum, 3 pounds. Combined, the composition is friction lighting.

47,311—April 18, 1865. S. KRACKOWIZER. *Improvement in the manufacture of friction-matches.*

A metallic coating of sulphide of lead is formed around the phosphoric mass, by impregnating the friction mass with hyperoxide of lead and nitrate of oxide of lead, and exposing the tipped and moist matches to a stream of hydrothionic acid gas.

50,843—November 7, 1865. H. REIMAN. *Improvement in friction-matches for lighting cigars, etc.*

Pasteboard or other stock for friction-matches is treated with a solution of potassium chlorate and niter.

53,454—March 27, 1866. L. LANSZWEERT. *Improved match-compound.*

A mixture of potassium chlorate, 35 parts; hyposulphate of lead, 15 parts; glass or silex, 4 parts; bichromate of potash, 10 parts; and gum or cement, 4 parts. The matches ignite only on a prepared surface containing black antimony and phosphorus.

66,101—June 25, 1867. L. O. P. MEYER. *Improvement in the manufacture of safety-matches.*

A match mixture of potassium chlorate, gelatine, and quartz or pumice stone, in relative proportions, for example, of 56 per cent, 20 per cent, and 24 per cent. The igniting surface may be formed of the red or the yellow prussiate of potash, mixed with a binder and with powdered glass or aluminous earth (though it is inferior to Hjerpe's igniting surface).

69,891—October 15, 1867. E. ANDREWS. *Improvement in the manufacture of matches.*

Match splints are united in the form of a card by arranging them side by side and dipping the nonigniting ends in glue.

95,730—October 12, 1869. W. H. ROGERS. *Improvement in friction-matches.*

An inflammable coating is applied to a friction match below the ignitible end. The coating may be of potassium chlorate, 8 parts; powdered charcoal, 2 parts; and dissolved rubber, 5 parts.

125,874—April 16, 1872. F. ZAISS. *Improvement in parlor-matches.*

Phosphuret or phosphide of sulphur, white Russian glue, and white dextrine or purified starch, with or without coloring material, is used to produce white or colored matches; and benzoin, cascarilla, or cinnamon to give a perfume while burning.

128,626—July 2, 1872. J. HOWE. *Improvement in matches for lighting cigars, etc.*

A mixture of 1 pound each of benzoin, myrrh, and cascarilla bark; one-fourth ounce each of nutmeg, oil of cloves, and oil of musk; and 2 pounds each of charcoal and potassium nitrate; formed into a paste with a mucilage.

136,953—March 18, 1873. J. F. BABCOCK, W. A. LEONARD, AND E. B. CRANE. *Improvement in match compositions.*

A fuse-strip is formed of pyroxyline, pure or mixed. It is molded with serrations and with friction-match composition on the whole or a part of its surface.

149,324—April 7, 1874. L. O. P. MEYER. *Improvement in the manufacture of safety-matches.*

In the manufacture of safety matches—Nos. 66,101 and 111,075—the paste is prepared with acetates of iron or of alcohol.

150,203—April 28, 1874. C. B. STEPHENS. *Improvement in matches or arrows for use with toy pistols or toy guns.*

A projectile for toy pistols consisting of an explosive coating on a body of wood or other material not easily ignited, as a parlor match made with the omission of coal-wax or like material from the detonating compound and splint.

153,004—July 14, 1874. J. J. MACHADO. *Improvement in the manufacture of friction-matches.*

A match dipped to some length into a slow-burning composition, not liable to be extinguished by a draft of air, and having a head of rapidly combustible composition, igniting only on a chemical-affinity surface. The heads are waterproofed by dipping into a solution of alcohol and tannic acid.

153,181—July 21, 1874. G. C. J. SCHNEIDER. *Improvement in compositions for safety blazing fusees, etc.*

A mixture of glue and starch in water, to which is added powdered glass, potassium chlorate, pumice stone, sulphuret of golden antimony, saltpeter, cascarilla bark, and lampblack.

153,451—July 28, 1874. L. O. P. MEYER. *Improvement in surface compounds for igniting safety-matches.*

A compound of india rubber, or allied gum, sulphur, and gray sulphuret of antimony; in the proportion, for example, of 2, 1, and 23 parts, respectively.

156,328—October 27, 1874. W. S. BEECHER. *Improvement in ammunition-matches for toy pistols.*

The ends of splints have coatings of detonating material and silicate of soda. Either may be first applied.

157,873—December 15, 1874. G. C. J. SCHNEIDER. *Improvement in safety-match compositions.*

A mixture of brick dust, potassium chlorate, golden sulphuret of antimony, flowers of sulphur, starch, and water.

169,539—November 2, 1875. E. HAANEL. *Improvement in safety-matches.*

A match composition of potassium chlorate, 1.6 part; sulphide of antimony, 0.3 part; sesquioxide of iron, 0.35 part; binoxide of manganese, 0.35 part; potassium chromate, 0.05 part; and powdered glass, 0.05 part; formed into a paste with a gelatine mucilage. The friction-tablet composition consists of amorphous phosphorus, 1 part; sulphide of antimony, 0.02 part; and powdered glass, 0.25 part; formed into a paint with the gelatine mucilage.

177,001—May 2, 1876. J. RADFORD. *Improvement in compositions for lighting cigars.*

A mixture of pulverized charcoal, wheat flour, potassium chlorate, and diluted vinegar or acetic acid.

177,134—May 9, 1876. W. J. LITTLEFIELD. *Improvement in compositions for cigar-lighters.*

A compound of lime, charcoal, cascarilla bark, gum, and water.

196,062—October 9, 1877. H. R. WHITEMAN. *Improvement in cigar-lighters.*

A disk provided with a pin or peg and having an inflammable body and a fulminate, the inflammable body consisting of a mixture of charcoal, niter, sulphur, gum-arabic, and flour.

230,226—July 20, 1880. C. F. BONHACK. *Friction-match.*

A mixture of niter, Venetian turpentine, phosphorus, glue, powdered glass, and crocus metallorum or other coloring matter.

230,775—August 3, 1880. G. HAYES. *Compound for preparing the wicks or matches of miners' squibs.*

A mixture of oil, one-half pint; sulphur, 32 ounces; camphor, 8 ounces; and red lead, 2 ounces; boiled and thoroughly mixed.

241,780—May 24, 1881. W. W. BATCHELDER. *Continuous match.*

An igniting pencil, one-half formed of an igniting composition rich in oxygen—as a mixture of potassium chlorate and binoxide of lead—and the other half of inert material, with a core of an ignitible composition, as phosphorus, the latter being separated from the igniting composition by a septum. It is ignited by friction.

242,427—June 7, 1881. D. BLUMENKRON. *Manufacture of matches.*

A match compound consisting of red oxide of lead, phosphorus, sulphuret of antimony, and a gummy vehicle.

A match having a stem of cotton strands saturated and coated with a translucent inflammable water and air proof solution, and a head waterproofed with an alcohol lac varnish.

251,891—December 27, 1881. L. WAGNER. *Manufacture of friction-matches.*

A match composition of hyposulphite of lead, peroxide of lead, potassium chlorate, crude or gray sulphide of antimony, pulverized charcoal, pulverized glass, saltpeter, sulphur, dextrine, suitable gelatinous binding substances, and water.

275,617—April 10, 1883. H. ENDEMANN. *Manufacture of matches.*

A stick, strip, or sheet of paper, pasteboard, or wood, saturated with oleic acid and having a suitable lighting composition held by a basic binding material, such as protoxide of lead, either incorporated with the igniting composition or first applied to the stick.

284,651—September 11, 1883. J. H. MITCHELL. *Manufacture of friction-matches.*

An impalpable dry powder, such as pumice stone or chalk, is injected upon the freshly dipped heads to form a nonadhesive surface.

302,717—July 29, 1884. W. B. ELTONHEAD. *Match.*

A fusee having a head of an ignitable compound combined with a powder made by grinding up discarded crucibles, cupels, and scorifiers.

335,065—January 26, 1886. F. W. FARNHAM. *Match.*

The head is composed of two separate compounds, one a safety composition, and the other, or tip, an ordinary, frictionally ignitible composition.

340,747—April 27, 1886. C. WEIBACH. *Pyrotechnic match.*

A stick having its head coated with a friction-igniting compound and the portion of the body adjoining the head coated with a pyrotechnic compound, or a series of compounds to produce lights of different colors.

418,202—December 31, 1889. J. LUTZ. *Inflammable composition for matches.*

A solution of sodium chlorate, ammonium sulphate, and a carbohydrate. Matches light by frictional contact on a surface prepared with amorphous phosphorus and washed black trisulphide of antimony.

436,877—September 23, 1890. W. M. NIX. *Match.*

A double-headed waterproof match having the splint previously soaked in a bath of sodium phosphate, so that it will not carbonize, and heads composed of glue or other gelatinous binder, paraffine, potassium chlorate, peroxide of lead, sulphide of antimony, and potassium bichromate.

485,103—October 25, 1892. J. KLEIN. *Match-heading composition.*

A compound of dextrine, water, phosphorus, minium, lampblack, and nitric acid.

562,426—June 23, 1896. C. R. A. G. SCHWIENING. *Match.*

A compound of potassium chlorate, red phosphorus, and calcium plumbate, igniting on any frictional surface.

579,913—March 30, 1897. H. ALLDAY. *Match-striking composition.*

A composition of phosphorus, gritty matter, and gum; thus available for both safety and friction matches.

592,227—October 26, 1897. L. ARONSON. *Match and composition for same.*

A fusee consisting of a stem and a friction-igniting head, with a waterproof, persistently combustible compound, not ignitible by friction, enveloping the head and portion of the stem adjacent thereto. The compound consists essentially of potassium chlorate, chromate of lead, amorphous phosphorus, sulphuret of antimony, dextrine, charcoal, and one or more resinous gums.

594,133—November 23, 1897. G. FIRSCHING. *Manufacture of matches.*

In the manufacture of headless safety-matches the end or ends of the match-splints (both ends may be made ignitible), they having been assembled into bundles, are dipped into a solution consisting of sodium chlorate, gum arabic, a sulphate of a metal proper (as of copper or iron), and water; then thoroughly dried; and then dipped, to a greater depth, in a hydrocarbon waterproof solution, as of rosin, turpentine, oleic acid, and linseed oil.

594,677—November 30, 1897. A. CHATELAN. *Composition for lighting cigars.*

A combustible composition of peroxide of manganese, potassium permanganate, potassium chlorate (with or without powdered coke and cinnamon bark), and an outer frictional-igniting head is applied to the end of a cigar or cigarette. A waterproof cap may be added.

603,666—May 10, 1898. A. TACHAUER AND L. BRALY. *Composition for making matches.*

A mixture of an adhesive substance and plumbates of calcium and strontium, metallic aluminum, and monosulphide of calcium, in suitable proportions, with or without powdered glass, hyposulphite of lead, sodium chloride, and potassium chlorate at defined temperature and proportion.

613,021—October 25, 1898. Y. SCHWARTZ. *Flash-light composition.*

A mixture of a light material, as a quickly combustible magnesium mixture, is combined with a cementing medium, such as a solution of pyroxyline in ether and alcohol, and made into the form of a foil.

614,350—November 15, 1898. H. SÉVÈNE AND E. D. CAHEN. *Match composition.*

Sesquisulphide of phosphorus is the essential ingredient, it being mixed with oxidizing bodies, inert matter, and glue.

622,109—March 28, 1899. E. G. BOHY. *Match.*

The match-paste contains a hypophosphite, as hypophosphite of calcium, in addition to the usual materials.

625,299—May 16, 1899. G. HACKEL. *Match-paste composition.*

It consists of potash, gum-arabic, amorphous phosphorus, potassium chlorate, a mineral coloring matter, hyposulphite of lead, and water, in specified proportions.

627,393—June 20, 1899. W. G. CORDES. *Match composition.*

A mixture of potassium chlorate, ground glass, whiting, plaster of paris, glue, and water, and amorphous red phosphorus, in specified proportions.

653,349—July 10, 1900. W. P. JONES AND H. M. BATES. *Match.*

A nonpoisonous composition, comprising potassium chlorate, sulphide of antimony, a metallic thiosulphate, oxide of manganese, potassium bichromate, an inert substance, red prussiate of potash, and adhesive material.

655,864—August 14, 1900. B. HEIMANN. *Self-lighting cigar.*

The ends of the independent leaves, before being rolled into form, are saturated with a composition including potassium chlorate, lampblack, pentasulphide of antimony, charcoal, and gelatine.

GROUP XV.—PLASTICS.

PYROXYLIN PLASTICS.

65,267—May 28, 1867. W. H. PIERSON. *Improved plastic compound made from vegetable fibers.*

A plastic is formed of cotton, hemp, flax, grass, wood, starch, sugar, or other equivalent vegetable matter acted upon by acids (nitric or a mixture of nitric and sulphuric acids) to soften or render soluble or partly soluble said vegetable matter in other solvents than said acids, the vegetable matter not being necessarily dissolved, but softened or pulpified; and articles of manufacture formed therefrom. The plastic, wet with equal parts of alcohol and ether, is applied to cotton batting, or any equivalent fiber, or spread on any mold or surface. Fabrics are waterproofed therewith. The plastic with its solvents is combined with metals and various metallic, silicious, or argillaceous substances in the pulverulent state. The plastic is mixed with drying oils for waterproofing and transparencies. Fur, plush, or other short fiber is attached by means of the plastic to give a fur-like surface. A compound for painting and coloring is formed by admixture of plastic and solvents with paints, oils, dyestuffs, etc.

77,304—April 28, 1868. J. A. McCLELLAND. (*Reissues: 3,777, 3,778—December 28, 1869.*) *Improved material for dental plates and for other purposes.*

Sheets of collodion and its compounds with resinous substances are comminuted and formed into massive forms by treating with ether and alcohol or other solvent, molding, pressing, and drying.

79,261—June 23, 1868. C. A. SEELY. *Improvement in solidified collodion.*

Nitro-glucose is combined with collodion to increase the flexibility and toughness.

88,228—March 23, 1869. L. R. STREETER. *Improved method of veneering articles with pyroxyline.*

Plastic pyroxylin or xyloidin is veneered to a base, dental plates or gums, with or without cement, by compression, and with heat, if need be.

88,260—March 23, 1869. L. R. STREETER. *Improved composition for dental plates.*

Soluble pyroxylin, or xyloidin, or gun-cotton combined with substances that will give the necessary quantities, is used for dental plates, e. g., a compound formed of pyroxylin, 240 parts; wax, 50 parts; zinc white, 30 parts; and coloring matter.

89,253—April 20, 1869. L. R. STREETER. *Improved dental plate.*

Dental plates and gums formed of pyroxylin, reduced to a dough and forced or pressed into molds, brought under pressure, and the solvent evaporated.

89,254—April 20, 1869. L. R. STREETER. *Improved process of treating pyroxle, pyroxyline, and the like substance, for forming useful and ornamental articles.*

Pyroxylin and its compounds are treated with suitable nonsolvents, as alcohol, sulphide of carbon, or naphtha, with or without a cementive agent, and rendered distensible, compressible, and impressible.

89,582—May 4, 1869. J. W. HYATT, JR., AND D. BLAKE. *Improved compound of ivory dust and other materials.*

Ivory dust or other pulverized material is agglutinized by combining collodion therewith and subjecting the composition to pressure during the evaporation of the volatile elements by means of heat.

90,766—June 1, 1869. J. A. McCLELLAND. *Improved machine for treating collodion and its compounds.*

Collodion and its compounds are mixed in a vacuum.

91,341—June 15, 1869. J. W. HYATT, JR., AND I. S. HYATT. *Improved method of making solid collodion.*

Pyroxylin, with or without an admixture of ivory dust or other material, is dissolved in a small quantity of solvent, under great pressure, forming a hard and solid product.

91,377—June 15, 1869. D. SPILL. *Improvement in compounds containing xyloidine.*

Compounds are produced of xyloidine in conjunction with oils, camphor, paraffine, and gutta-percha; one or more of the ingredients, as camphor, is dis solved in the oil, the solution forming a nonvolatile solvent for xyloidine, which becomes a part of the resulting compound.

96,132—October 26, 1869. J. A. McCLELLAND. *Improved mode of producing useful articles from collodion and its compounds.*

A sheet of collodion and resinous matter is heated until soft and plastic, and then the article is stamped out between dies.

97,454—November 30, 1869. D. SPILL. *Improvement in dissolving xyloidine for use in the arts.*

Solvents are employed which are not necessarily in themselves solvents of xyloidine, but become so by the addition of other bodies or compounds. Eight specified solvents include as elements camphor or camphor oil, alcohol or spirits of wine, hydrocarbons having a b. p. 105° to 205° C., castor oil, bisulphide of carbon, and aldehyde.

101,175—March 22, 1870. D. SPILL. *Improvement in the manufacture of xyloidine and its compound.*

Cotton or other vegetable fiber or lignine is reduced to a finely divided state; mixed with the aid of mechanical means in a vessel having revolving arms or beating bars, with a suitable quantity of acid; the acid strained from the fiber; the product pressed to remove excess of acid, and the pressed mass then opened out, washed, drained, and dried. The xyloidine is bleached directly after the removal of the acids and before removing it from the vat by means of any bleaching solution, making use of alternate stirrings and rest. It is dyed after draining and before pressing, by any fiber-dyeing process, either before or after the solution of the same in suitable solvents. For spreading upon fabrics 1 part of xyloidine is dissolved in from 5 to 12 parts of solvent, strained through a fine sieve under pressure, and spread on the fabric or surface in a semifluid condition. To reduce it to a nearly dry condition the strained solution or paste is treated in a closed mixing vessel connected with an exhaust apparatus, the vessel being heated to about 100° C. The solvent vapors that pass off are condensed for re-use.

103,209—May 17, 1870. J. LEWTHWAITE. *Improvement in coating fabrics with parkesine.*

Parkesine or xylonite in a plastic state is spread upon the surface of the fabric and immediately subjected to pressure, which is continued for several days, when the material is to be pliant or supple. If the surface is required to be polished it is subjected to the action of rotating brushes after the parkesine has become fixed.

105,338—July 12, 1870. J. W. HYATT, JR., AND I. S. HYATT. (*Reissues: 5,928—June 23, 1874; 10,546—December 23, 1884.*) *Treating and molding pyroxyline.*

Finely comminuted camphor gum is mixed with pyroxylin pulp and rendered a solvent by the application of heavy pressure in a heated mold.

105,823—July 26, 1870. J. A. McCLELLAND. *Improved process for coating objects with collodion and its compounds.*

Collodion is molded upon the article to be coated, so as to obtain the coating at one operation.

114,242—April 25, 1871. R. H. WINSBOROUGH. *Improvement in the preparation and application of pyroxyline for dental plates.*

Pyroxylin for dental purposes is bleached by the application of chlorine to render it highly translucent. The camphor of dental plates formed by the introduction of camphorated pyroxylin into plaster or porous moulds is expelled by artificial heat or evaporation, or extracted by chemical means.

127,656—June 4, 1872. V. SMITH. *Improvement in compounds for dental purposes.*

A dental plate made of gun-cotton, prepared gum shellac, gum camphor, with a compound formed of oxide of zinc, Chinese vermilion, and oxide of tin and gold, together with sulphuric ether and alcohol.

133,229—November 19, 1872. I. S. & J. W. HYATT. *Improvement in process and apparatus for manufacturing pyroxyline.*

A mixture of pyroxylin and camphor gum is dried by compressing it into cakes and subjecting them to pressure in a pile with interposed layers of absorbent material. Pyroxylin is transformed by means of camphor gum by subjecting the material to pressure in the upper part of a cylinder, kept sufficiently cool to prevent the melting of the solvent during the compression and expulsion of the air, while the lower portion is heated sufficiently high to melt the solvent and transform the pyroxylin, which is forced through the same and out of a discharge nozzle, as a rod, bar, or sheet.

133,969—December 17, 1872. L. DEITZ AND B. P. WAYNE. *Improvement in the manufacture of pyroxyline and articles therefrom.*

Pyroxylin made from ramie, *Bochmeria nivea.*

143,772—October 21, 1873. J. A. McCLELLAND. *Improvement in collodion compounds.*

The converted material is dried by the alternate application of pressure and exposure to the atmosphere. Absorbent pads of felt cloth or other material, with paper interposed, are used while the material is under pressure.

143,865—October 21, 1873. H. T. ANTHONY. *Improvement in preparing soluble cotton for the manufacture of collodion.*

Soluble cotton is subjected to the action of volatilized alkali, preferably ammonia, after the ordinary acid treatment and washing, to remove traces of acid.

150,722—May 12, 1874. D. D. SMITH. *Improvement in artificial coral for jewelry.*

A mixture of gun-cotton, 24 parts; gum copal, 5 parts; alcohol, 10 parts; perchloride of tin, one-twentieth part; gum-shellac, 1 part; ether, 20 parts; perchloride of gold, one-fortieth part; magnesium oxide, 1 part; protochloride of tin, one-twentieth part; and oxide of mercury, 1 part.

152,232—June 23, 1874. I. S. & J. W. HYATT. *Improvement in apparatus and processes for molding celluloids and the compounds of pyroxyline.*

Celluloid is molded in a closed vessel supplied with steam, in a porous or suitable mold. A safety valve regulates the pressure and temperature.

153,196—July 21, 1874. R. FINLEY HUNT. *Improvement in molding celluloids for dentists and others.*

Celluloid is softened and molded with dry heat.

156,352—October 27, 1874. I. S. & J. W. HYATT. *Improvement in manufacturing solidified collodion.*

Pyroxylin is mixed with a latent solvent which becomes active only upon the application of heat, e. g., pyroxylin mixed with 1 part of camphor and 8 parts of alcohol.

156,353—October 27, 1874. J. W. & I. S. HYATT. *Improvement in the manufacture of celluloid.*

A solvent of camphor, such as alcohol, is added to the mixture of pyroxylin and camphor previous to mastication, heat, and pressure, using, say, 100 parts of dry pyroxylin and 25 to 40 parts of gum camphor, with 20 to 40 per cent of alcohol after the aforesaid ingredients are mixed and the aqueous moisture has been expelled.

165,234—July 6, 1875. J. W. & I. S. HYATT. *Improvement in grinding-wheels.*

A grinding wheel made of emery or similar particles united by celluloid, or pyroxylin, or their components.

172,995—February 1, 1876. F. GREENING. *Improvement in the manufacture of soluble gun-cotton and products therefrom.*

A mixture of hydrochloric acid with sulphuric acid and nitric acid is used for the conversion of cotton; as sulphuric acid, 250 parts; hydrochloric acid, 35 parts; and nitric acid, 50 parts. Semitransparent products are obtained by the addition of finely divided and levigated silica, or powdered glass or sulphate of lime; insulating compounds by the use of creosote with soluble gun cotton and certain gums.

173,865—February 22, 1876. C. REAGLES. *Improvement in compositions for dental plates, etc.*

A compound of pyroxylin, 40 parts, by weight; compound ethylated camphor 25 parts; flexible lac, 15 parts; caoutchouc shavings, 5 parts; and cera alba, 5 parts; with Canada balsam and pigments.

184,481—November 21, 1876. P. SWEENEY. *Improvement in lubricating compounds.*

A lubricant consisting of plumbago and collodion, with paper pulp or equivalent fibrous material.

200,939—March 5, 1878. R. H. & A. A. SANBORN AND C. O. KANOUSE. *Improvement in collars and cuffs.*

A fabric for collars and cuffs having outer sheets or layers of celluloid and an interlining of textile or fibrous material.

204,227—May 28, 1878. J. W. HYATT. *Improvement in apparatus for covering cores and forming tubes of celluloid and other plastic materials.*

The composition is fed in equal quantities to all sides of a core, which core is withdrawn from the composition, leaving the tubular coating.

209,570—November 5, 1878. J. W. HYATT. *Improvement in varnishes.*

The solid extract of logwood dissolved in either alcohol or methylic spirit, or both, is combined with a resin soluble in alcoholic or methylic spirit or pyroxyline, and the tincture of the muriate of iron to produce an ebony varnish.

216,474—June 10, 1879. V. TRIBOUILLET AND A. DE BESAUCÈLE. *Improvement in processes of manufacturing solid collodion.*

Dried cellulose is treated with acids in closed glazed vessels followed by pressing, washing, and drying; and the pyroxyle so prepared is treated with solvents, liquid or solid, as camphor, with or without the addition of coloring or other materials.

217,232—July 8, 1879. W. McCAINE. *Improvement in processes for treating pyroxyline.*

Pyroxylin is reduced to a liquid by solvents without heat or pressure—as by dissolving it in a solution of camphor gum in sulphuric ether and then introducing spirits of turpentine—and then cast in porous molds. The product is treated with alcohol to render it plastic, compressed in any desired form, and hardened by immersion in olive oil.

220,502—October 14, 1879. J. S. SPENCER. *Improvement in frames for optical instruments made of celluloid and other fibrous plastic compositions.*

Frames for optical instruments are made from fibrous plastic composition by cutting the frames from the material when in sheets and forming them upon a mandrel. They are removed from the mandrel by introduction of heat into the mandrel.

221,070—October 28, 1879. J. W. HYATT. *Improvement in processes of manufacturing, polishing, and seasoning sheets of celluloid and other plastic material.*

Sheets of celluloid are subjected to pressure between a polished surface and a layer of absorbent material, to both dry and polish.

232,037—September 7, 1880. J. W. HYATT. *Manufacture of celluloid.*

Veneers of celluloid or other plastic material are applied to moldings and uneven surfaces by attaching a strip of the material so as to span the face of the article, then inserting the two in an elastic tube and contracting the tube by means of a vacuum pump or by external pressure.

233,558—October 19, 1880. J. & C. SCHMERBER. *Process of treating pyroxyline in the manufacture of plastic compounds.*

In the manufacture of plastic compounds from pyroxylin, danger of ignition is avoided by treating the nitro-derivative of cellulose, dextrine, or glucose while wet with a solvent, mixing gums, balsams, or pigments and reducing the product to a semi-liquid form by heat, grinding and mixing the semi-liquid mass, and finally drying the compound to a plastic consistency.

233,851—November 2, 1880. N. HART AND R. A. BACON. *Decorating celluloid.*

Celluloid surfaces are decorated and the color united with the celluloid, by the use of aniline colors dissolved in carbolic acid and alcohol.

234,675—November 23, 1880. C. M. JACOB. *Composition for coating surfaces.*

A composition of collodion, creosote from Norway-beech tar, boiled linseed oil, black oxide of manganese, and resin, as a protective coating for materials or for ornamentation. Pigments or mineral colors or bronze or other metal powders may be combined therewith.

237,279—February 1, 1881. S. J. HOGGSON AND G. C. PETTIS. *Method of producing and treating pyroxyline and the manufacture of articles therefrom.*

The fiber is prepared in a sheet form, and treated to the acid bath; the pyroxylin sheet is then applied to the surface to be covered and subjected to a pyroxylin solvent until converted into a gelatinous condition, when it can be rolled, or reëmbossed and finished.

239,423—March 29, 1881. L. S. BEALS. *Treating pyroxyline.*

A compound of mirbane, oil of lavender, benzole, and alcohol is employed as a solvent for pyroxylin, and olibanum frankincense is added, with or without paraffine or vegetable wax, to render it plastic without shrinking or warping.

239,424—March 29, 1881. L. S. BEALS. *Preparing pyroxyline.*

Soluble pyroxyline is rendered permanently plastic under heat by mixing therewith paraffine dissolved in mirbane and the essential oil of lavender.

239,425—March 29, 1881. L. S. BEALS. *Preparing pyroxyline.*

Pyroxylin is treated with vegetable wax, either with or without the addition of paraffine, and preferably by means of a solvent formed of mirbane, oil of lavender, benzole, and alcohol.

239,791—April 5, 1881. J. W. HYATT. *Process of and apparatus for molding celluloid, hard rubber, bonsilate, and analogous plastic materials.*

Molds or dies containing the material are immersed in liquid in a suitable vessel and heat and pressure applied to the liquid.

241,005—May 3, 1881. N. HART AND R. A. BACON. *Decorating celluloid.*

Surfaces composed wholly or in part of compounds of pyroxylin are decorated by applying colors mixed with a solvent of pyroxylin; as aniline colors, dissolved in alcohol and ether, with or without carbolic acid.

244,916—July 26, 1881. O. MONROE. *Process of treating pyroxyline scraps.*

A homogeneous pyroxylin compound is produced from scrap by treating it with a solvent, with or without the addition of a coloring agent, and then subjecting it to the action of a machine which mixes it and compresses it by forcing it through an outlet or nozzle.

245,952—August 23, 1881. S. J. HOGGSON AND G. C. PETTIS. *Manufacture of plastic compounds from pyroxyline.*

Pyroxylin, after washing, is treated in a bath containing in solution hydrochlorate of ammonia, muriate of ammonia, or any of the ammoniacal salts, whereby it is rehydrogenized and rendered less explosive. Sulphate of alumina or any of the "octohedron" or isomorphous salts are combined with pyroxylin; alum being a natural base, working hot or cold or in any proportions, with or without the addition of gums, resins, balsams, oils, pigments, dyes, or coloring ingredients. Flour of steatite is added, acting as a lubricant, when the material is to be pressed in molds or dies.

246,891—September 13, 1881. C. S. LOCKWOOD. *Treatment of pyroxyline.*

Chloral is used as a solvent of camphor in a pyroxylin compound containing camphor, say from 5 to 20 parts of chloral to 100 parts of camphor; it lowers the liquifying temperature.

247,734—September 27, 1881. C. O. KANOUSE. *Manufacture of plastic composition from soluble fiber.*

Soluble fiber is mixed and dissolved in a volatile solvent in a heated state in an open vessel, the evaporation accelerating the solvent action.

248,413—October 18, 1881. I. W. DRUMMOND. *Compound of celluloid and luminous material.*

A solid luminous compound formed of celluloid and luminous or phosphorescent material, as sulphide of calcium.

249,600—November 15, 1881. J. B. EDSON. *Drying apparatus for treating pyroxyline, etc.*

Pyroxylin and similar substances are dried by the use of cold intensely dry air, maintained slightly above the freezing point, introduced through the material while in a finely divided condition, and thence discharged from the receiver.

251,410—December 27, 1881. W. B. CARPENTER. *Waterproofing paper with celluloid and other materials.*

A paper made of asbestos and plastic material such as celluloid, lignoid, coroline, shellac, resin, or gums. The paper may be put through a vapor bath of alcohol, when the substance used, as celluloid, is capable of being dissolved in alcohol, or through turpentine vapor when resin or gums are used, and then through heated rolls to thoroughly integrate the material.

253,480—February 21, 1882. W. B. CARPENTER. *Waterproof paper.*

A paper made of paper-pulp and a plastic waterproof material, such as celluloid, lignoid, etc. It may be put through a vapor bath of alcohol or rapidly through a weak alcoholic bath and then through heated rolls (see No. 251,410).

254,280—February 28, 1882. F. W. COTTRELL. *Manufacture of material to form artificial ivory.*

Fiber is rendered soluble in alcohol by immersion in a saturated solution of nitrous acid in sulphuric acid for a very short period, then slightly pressed and allowed to stand twenty minutes to an hour to complete its conversion. It is then washed, neutralized with a saline solution, afterwards adding strong solutions of alum, carbonate of soda, and silicate of soda.

254,751—March 7, 1882. L. WHITE AND K. WHITCOMB. *Apparatus for determining the nitration of cellular fiber.*

It is determined by the deflection of a galvanometer, using a cathode and anode on opposite sides of a mixing vessel, the deflection being compared with that of a standard quality.

256,597—April 18, 1882. P. REID AND J. EASTWOOD. *Manufacture of pyroxyline for use in topical printing.*

An ink or color for topical printing, or "calico printing," composed of dissolved pyroxylin and a coloring agent.

262,077—August 1, 1882. W. McCAINE. *Pyroxyline compound.*

The essential oil of cassia or cinnamon is used in the manufacture of compounds of pyroxylin; combined with alcohol alone or in conjunction with hydrocarbons, say in the proportion of 1 part to 8 of alcohol, it forms a latent solvent.

264,987—September 26, 1882. E. WESTON. *Plastic compound from soluble cellulose.*

Nonfibrous or amorphous cellulose; produced by reconverting or reoxidizing celluloid in a bath of ammonium sulphide, protochloride of iron, or equivalent reducing agents.

265,337—October 3, 1882. H. PARKES. *Manufacture of nitro-cellulose.*

Nitrocellulose is dyed prior to dissolving or softening and treatment with solvent. Tetrachloride of carbon, together with camphor, is employed as a solvent, or a solvent composed of bisulphide of carbon together with camphor, or sulphurous acid and camphor.

269,340—December 19, 1882. J. H. STEVENS. *Manufacture of compounds of pyroxyline or nitro-cellulose.*

In the manufacture of compounds of pyroxylin a new group of active liquid solvents or converting agents is used, comprising oil of spearmint, nitrate of methyl, butyric ether, valeric ether, benzoic ether, formic ether properly dehydrated, salicylate of methyl, formate of amyl, acetate of amyl, butyrate of amyl, valerianate of amyl, sebacylic ether, oxalic ether, amylic ether (amylic oxide), oxidized wood alcohol, oil of cassia, oil of cherry, laurel, heavy cinnamon oil, oil of melissa (balm), oil of birch tar (rectified), and oil of pennyroyal.

269,341—December 19, 1882. J. H. STEVENS. *Manufacture of compounds of pyroxyline or nitro-cellulose.*

In the manufacture of compounds of pyroxylin certain specified oils are used as latent liquid solvents, viz, oil of caraway seed, oil of hyssop, oil of sage, oil of tansy, oil of cloves, or oil of wintergreen, or mixtures of them.

269,342—December 19, 1882. J. H. STEVENS. *Manufacture of componds of pyroxyline or nitro-cellulose.*

In the manufacture of pyroxylin compounds dinitro-benzine or coumarine are used as latent solid solvents.

269,343—December 19, 1882. J. H. STEVENS. *Manufacture of compounds of pyroxyline or nitro-cellulose.*

In the manufacture of pyroxylin compounds certain new menstrua are used in conjunction with camphor, viz, acetone, acetate of ethyl, acetate of methyl, fusel-oil (amylic alcohol), oil of chamomile, oil of fennel-seed, oil of palmarosa, and oil of worm-seed, or mixtures of any of them.

269,344—December 19, 1882. J. H. STEVENS. *Manufacture of compounds of pyroxyline or nitro-cellulose.*

In the manufacture of pyroxylin compounds fusel oil is employed as a solvent or menstruum in conjunction with the oils of hyssop, sage, tansy, wormwood, fennel seed, cloves, cinnamon, anise, sassafras, chamomile, wintergreen, caraway seed, or of dill, or with acetal, nitrate of amyl, or nitrite of amyl, or mixtures of any of them.

269,345—December 19, 1882. J. H. STEVENS. *Manufacture of compounds of pyroxyline or nitro-cellulose*

In the manufacture of pyroxylin compounds certain menstrua or mixtures of the same are employed in conjunction with alcohol (ethylic or methylic), viz, acetal, nitrate of amyl, nitrite of amyl, oils of chamomile, valerian, golden-rod, sassafras, anise, cinnamon, cumin, cynæ ether, dill, elecampane, fennel seed, wine (heavy), wormseed, myrtle, laurel, marjoram, peppermint, rue, cinnamon leaves, palmarosa, rosemary, and erigeron.

271,493—January 30, 1883. J. A. McCLELLAND. *Pyroxyline fabric.*

A fabric composed of a sheet or sheets of pyroxylin compound with threads, filaments, or fibers embedded therein and all extending in the same direction.

271,494—January 30, 1883. J. A. McCLELLAND. *Process of veneering or covering articles with pyroxyline compounds, etc.*

A sheet or sheets of the plastic material is applied to the article and it is inclosed or surrounded by mobile or yielding material, such as sand or putty, and subjected to pressure.

275,215—April 3, 1883. I. S. HYATT. *Process of manufacturing sheets of celluloid and other plastic material.*

A sheet of polished celluloid having a backing is produced by placing the sheet on a polished surface, laying upon the same a backing moistened or saturated with a solvent of pyroxylin, placing upon the backing absorbent material, and subjecting the whole to pressure.

276,443—April 24, 1883. W. McCAINE. *Process of treating pyroxyline compounds.*

A pyroxylin compound containing a latent solvent is reduced to a powder, then thoroughly dried, and when dry subjected to heat and pressure, whereby a dry product is obtained free from air cells.

280,745—July 3, 1883. J. W. HYATT. *Press or mold for coating articles with celluloid, etc.*

The article is placed between sheets of celluloid and the whole between diaphragms or sheets of flexible material, when fluid pressure is applied to the upper or lower sides of the diaphragms, the fluid being first hot and then cold.

283,225—August 14, 1883. J. B. EDSON. *Manufacture of artificial ivory.*

Artificial ivory is formed by compressing a number of sheets of zylonite, formed of material of different densities or different characteristics of composition, into one entire mass, and then making sections across the several layers.

286,212—October 9, 1883. D. & D. McCAINE. *Process of treating pyroxyline, etc.*

Pyroxylin is dissolved in a suitable solvent, and it is then treated with benzine or equivalent light mineral oil and resin, producing a homogeneous product, free from air bubbles.

289,239—November 27, 1883. J. B. EDSON. *Apparatus for polishing sheets of zylonite, etc.*

The surface is slightly dissolved by any of the well-known solvents, and then the sheet is subjected to pressure, with the slightly dissolved surface in contact with a highly polished surface, such as glass.

289,240—November 27, 1883. J. B. EDSON, *Forming and finishing surfaces coated with zylonite.*

A sheet of fabric coated on one or both sides with thin sheets of zylonite through the medium of an interposed solvent; produced by passing a thin sheet of zylonite and a sheet of the material to be coated between rolls and introducing a solvent between the two sheets to slightly dissolve the surface of the zylonite, whereby the sheets are immediately compressed.

289,241—November 27, 1883. J. B. EDSON. *Patent leather and a substitute therefor.*

A base-forming material, having attached to one of its surfaces a thin sheet of zylonite having a highly polished surface. It is prepared by partially dissolving one surface of the zylonite and uniting it to the base, and then partially dissolving the exterior surface of the sheet of zylonite and compressing the partially dissolved surface next to a highly polished surface.

289,338—November 27, 1883. J. B. EDSON. *Treating material with zylonite to resemble pebble, goat, French calf, and alligator leather.*

A thin sheet of zylonite of a proper color is applied to a sheet of leather, such as are technically called "splits," by partially dissolving one surface of the zylonite by a suitable solvent and applying the partially dissolved surface to the base, then applying pressure for a period of time sufficient to imitate the kind of leather to be produced and to expel the surplus solvent and air. Then partially dissolving the exterior surface of the sheet of zylonite and compressing it against a highly polished surface.

294,557—March 4, 1884. W. V. WILSON. *Manufacture of material for electric insulation.*

Two hundred parts of wood or vegetable tar is combined with about 100 parts of nitrocellulose—the nitration of which has not been carried beyond the point which will effect its greatest solubility—the latter being softened by one or more of its solvents.

294,661—March 4, 1884. G. M. MOWBRAY. *Plastic compound from pyroxyline and mica.*

Mica is combined with soluble pyroxylin.

296,967—April 15, 1884. J. W. HYATT. *Art of manufacturing celluloid and other compounds of pyroxyline.*

Aqueous particles are removed from pyroxylin pulp by displacement, under pressure, with an unobjectionable liquid, as alcohol, which may be utilized as a solvent.

296,968—April 15, 1884. J. W. HYATT, W. H. WOOD, AND J. H. STEVENS. *Process of and apparatus for effecting the desiccation of pyroxyline pulp.*

A pile is formed of layers of pyroxylin and bibulous material, as blotting paper, and subjected to great pressure, the pyroxylin being subjected then to further pressure between dry sheets.

296,969—April 15, 1884, J. W. HYATT, J. H. STEVENS, W. H. WOOD, AND J. EVERDING. *Manufacture of pyroxyline material.*

Pyroxylin material is impregnated with liquid solvents by forming it into cakes or plates, placing them in a suitable vessel where they are held apart, introducing the liquid solvent, and agitating or rotating the vessel, whereby the solvent repeatedly passes over the surface of the cakes or plates.

296,970—April 15, 1884. J. W. HYATT, J. H. STEVENS, AND W. H. WOOD. *Manufacture of celluloid and other compounds of pyroxyline.*

Pyroxylin is formed into cakes and dried, and the cakes then softened with the required amount of liquid solvent by being formed into a pile with the solvent between the cakes, the material being afterwards mixed or masticated in heated rolls.

297,770—April 29, 1884. J. B. EDSON. *Finishing and glossing the surfaces of fabrics having a coating of some pyroxyline compound.*

The zylonite sheet is passed through a fluid acting as a solvent of the zylonite, which upon evaporation leaves a glossy surface. By passing the sheet or coated fabric around a roller in the solvent, one side only is exposed to the action of the solvent.

297,935—April 29, 1884. J. W. HYATT. *Process of desiccating pyroxyline in comminuted form.*

Nitrocellulose is ground in water and then agitated in contact with an absorbent, as bags of porous absorbent material in a closed revolving vessel.

299,857—June 3, 1884. E. SCHERING. *Preparation of collodion.*

An elastic and transparent composition for the preparation of collodion, becoming hard on drying, neither explosive on concussion nor spontaneously combustible; formed by dissolving pure collodion cotton in ether and alcohol and then freeing from its solvents, by distillation after filtration, sufficient to admit of the mass being cast into forms.

300,158—June 10, 1884. J. H. STEVENS. *Manufacture of material to imitate ivory from pyroxyline compounds.*

Strips are cut of one or more thin pieces of material of varied color, treated with a solvent and compacted on edge into a cake, welded together by heat and pressure, and the block then reduced to sheets.

307,032—October 21, 1884. J. B. EDSON. *Manufacture of artificial ivory from zylonite, etc.*

Two or more sheets of soluble pyroxylin having inert matters, and colored or otherwise, are rolled into scroll form, or assembled in block form, and forced through a nozzle or die, so that the several layers shall partially preserve their parallelism; or the scrolls are molded or consolidated into a cake which is then cut into sheets or sections.

309,831—December 30, 1884. J. B. EDSON. *Manufacture of artificial ivory.*

Imitation grain-ivory produced by combining two or more layers of a pyroxylin base pigmentized in slightly varying proportions; as one group of layers of transparent horn-colored pyroxylin with 7½ per cent of oxide of zinc and one-half of 1 per cent of yellow coloring matter, and another group of the same with 15 per cent of oxide of zinc and one-quarter of 1 per cent of yellow coloring matter.

311,203—January 27, 1885. I. V. REAGLES. *Composition of matter for waterproofing.*

A compound of wood alcohol, 1 gallon; castor-oil, 1 pound; gum camphor, 1 pound; pyroxylin, 1 pound; and gum shellac, one-fourth of a pound.

320,884—June 23, 1885. G. M. MOWBRAY. *Plastic-compound resembling ivory.*

A pyroxylin product composed of a series of sheets of pyroxylin and neutral matter of uniform composition, with one or both surfaces of the superposed sheets colored or tinted, and the sections united together by heat and pressure or solvents and pressure.

329,093—October 27, 1885. J. H. STEVENS AND W. H. WOOD. *Utilizing celluloid, etc., in the production of enameled goods or veneering.*

A sheet of seasoned pyroxylin material is attached to a backing and at the same time given a high polish by subjecting them to pressure accompanied by a high degree of heat, the exposed surface of the pyroxylin being in contact with a polished surface.

329,313—October 27, 1885. J. G. JARVIS. *Manufacture of pyroxyline compounds.*

Gum dammar, gum guaiacum, and gum mastic, separately or in mixtures of two or more of them, are used as solvents of pyroxylin with or without pigments or other coloring matters, fixed or volatile oils.

331,241—November 24, 1885. J. W. HYATT. *Method of combining pyroxyline and its solvents in the manufacture of solid compounds.*

Pyroxylin is reduced to a finely divided dry condition, as soluble paper to shreds, then moistened with vinous alcohol or its equivalent, when the powdered camphor is added and the mixture subjected to masticating rolls, or to heat and pressure.

331,242—November 24, 1885. J. W. HYATT. *Method of combining pyroxyline and its solvents in the manufacture of solid compounds.*

The solvent is sprayed against a moving stream of pyroxylin pulp, the sprayed pulp falling into a closed receptacle and resting until the solvent is diffused, when it is masticated.

331,713—December 1, 1885. J. W. HYATT. *Compounding pyroxyline with its solvents in the manufacture of solid compounds.*

Pyroxylin is formed into flock or pulp, and into thin sheets or films, and the solvent then applied to the sheets by spraying or dipping; the sheets are then massed in a closed receptacle and the conversion finally completed by means of masticating rolls or heat and pressure.

342,208—May 18, 1886. J. G. JARVIS. *Manufacture of zylonite and other pyroxyline compounds and articles made therefrom.*

A seasoned, pulverized, and comminuted pyroxylin compound is treated with a solution of camphor, the solvent of which is not a solvent of pyroxylin—such as coal tar naphtha—and the solvent of camphor is then eliminated from the mass. The mass may then be subjected to the action of heated alcoholic vapor.

346,376—July 27, 1886. M. C. LEFFERTS. *Process of printing upon or decorating the surface of celluloid.*

The design is printed or applied in ink or color and the surface is then subjected to the action of heat and pressure while in contact with a polished surface; to prevent displacement it may be confined in a mold or die.

348,222—August 31, 1886. M. C. LEFFERTS and J. W. HYATT. *Printing on pyroxyline compounds.*

The pyroxylin compound is subjected to heat and pressure while in contact with the engraved plates; the ink may contain or consist of a solvent of pyroxyline and a pigment.

349,658.—September 21, 1886. G. M. MOWBRAY. *Process of and apparatus for washing, decoloring, and draining pyroxyline.*

Pyroxylin is decolorized by the action of oxalic acid and hydrochloric acid; it is then subjected to washing by the flow of water through the mass from one side or end of a tank with overflow at the other.

349,659—September 21, 1886. G. M. MOWBRAY. *Method of drying pyroxyline.*

Pyroxylin is desiccated by means of warmed air (not to exceed 38° C.) which has been previously deprived of its moisture by chilling and passing over lime, either or both.

360,811—April 5, 1887. J. A. McCLELLAND. *Method of treating and ornamenting pyroxyline compounds.*

The surface of celluloid containing a pigment is treated, in proper design, with an acid that will dissolve the pigment. The grain of ivory is imitated by coating the surface with a resist, removing parts of the resist according to the graining, or design, and then applying the pigment solvent. Coloring matter may be afterwards applied, with or without a new resist.

366,231—July 12, 1887. J. A. McCLELLAND. *Plastic compound.*

A non volatile gum or resin is used as a solvent for pyroxylin, as kauri gum, with or without pigments, or fixed or volatile oils.

372,100—October 25, 1887. O. P. AMEND. *Compound for pyroxyline or nitrocellulose.*

Chloride of amyl in conjunction with camphor is used as a solvent for pyroxylin.

383,272—May 22, 1888. A. BENSINGER. *Process of ornamenting celluloid surfaces.*

The design, printed on paper with a suitable ink, is transferred to the celluloid surface, the latter being moistened with a solvent of the same and of the ink, under pressure.

408,344—August 6, 1889. F. GREENING. *Substitute for ivory, etc.*

A base is prepared by treating fibrous or cellulose substances, such as cotton combings, rags, paper, etc., with a mixture of fuming nitric acid and sulphuric acid, in the proportion of 30 per cent of the former and 70 per cent of the latter, then washing, and submitting the product to a bath of sodium chloride and ammonia alum, and then dissolving the base in a solvent composed of a distillation of acetate of lead, 2 parts, and anhydrous lime, 1 part, mixed with fusel oil; 2½ gallons of the distillate to 1½ gallons of fusel oil.

409,345—August 20, 1889. C. F. BRADY. *Process of printing pyroxyline compounds.*

Pyroxylin compounds are imprinted with indelible colors by applying the coloring matter to the sheets by pressure and subsequently subjecting them to the direct action of steam in a chamber.

417,727—December 24, 1889. J. G. JARVIS. *Process of ornamenting articles having a pyroxyline base.*

The design is embossed upon the plastic material, then it is stained or colored, and finally the article is submitted to heat and pressure to smooth the embossed surface.

418,136—December 24, 1889. C. H. KOYL. *Reflector or mirror.*

A sheet of transparent celluloid silvered on the back.

418,237—December 31, 1889. R. C. SCHUPPHAUS AND M. T. WHITE. *Process of manufacturing pyroxyline.*

The body of cellulose is confined in a perforated cage while being treated in a nitrating solution to secure it against disintegration or disarrangement.

421,367—February 11, 1890. W. H. WOOD AND G. C. GILLMORE. (*Reissue: 11,374—April 15, 1890.*) *Process of embossing sheets of celluloid.*

The material is embossed between a die and a "force" composed of celluloid or like material, with heat sufficient to cause them both to flow, the pressure being continued until the material to be embossed is forced into the die, and the die, "force," and material to be embossed retained in contact until cooled.

428,654—May 27, 1890. E. N. TODD. *Process of manufacturing thin sheets of nitro-cellulose, etc.*

Glass plates are vertically suspended in a tank of a solution of collodion or pyroxyline, and after standing until all bubbles have escaped, the solution is drawn off slowly from the bottom of the tank, causing a film of solution to adhere to the plates, which, after drying, is removed as a thin, uniform transparent sheet.

458,157—August 25, 1891. F. ECKSTEIN. *Composition of matter for use as a substitute for glass.*

A composition consisting of collodion-wool, a nonresinous oil, as castor oil, and a balsam or soft resin, with or without magnesium chloride to lessen inflammability.

460,086—September 22, 1891. W. HARVEY. *Artificial horn and method of producing the same.*

Artificial horn, produced by coloring sheets of plastic material, as celluloid or pyroxylin, in layers or strata, cutting the sheets into conical figures or forms, nesting or laminating and uniting them, and then rolling and turning off the projecting edges of the series of nested and united cones to constitute a solid laminated mass or rod.

465,784—December 22, 1891. W. SCHMIDT. *Process of polishing sheets of pyroxyline material.*

A sheet of pyroxylin material is subjected to the action of vapor of alcohol and then pressed between polished surfaces.

470,451—March 8, 1892. A. SEHER. *Manufacture of compounds of pyroxyline.*

As direct solvents of pyroxylin or nitrocellulose, there is used propion, butyron, valeron, capron, methyl-ethyl-ketone (acetyl-ethyl), methyl-propyl-ketone, methyl-butyl-ketone, methyl-valeral, ethyl-butyl-ketone, and methyl-amyl-ketone, singly or any mixtures thereof.

474,814—May 17, 1892. A. A. C. DE COËTLOGON. *Process of preparing celluloid and similar materials for printing.*

Celluloid having a surface adapted to be printed upon and absorb the ink; produced by forming on the surface a multitude of minute grains or pores, as by a sand jet, then washing the surface, then varnishing, applying an impalpable powder—as sulphate of magnesia and sulphate of baryta—and then producing a calender finish.

490,195—January 17, 1893. B. B. GOLDSMITH. *Process of producing nitro-cellulose or celluloid surfaces.*

Wood or other absorbent material is first given a coat or coats of varnish containing pyroxylin or pyroxylin compound, then layers of varnish containing resin, with or without a finishing coat of varnish containing pyroxylin.

508,124—November 7, 1893. H. D. TURGARD. *Process of denitration of nitro-cellulose and its compounds.*

Nitrocellulose and its compounds are denitrated by immersing the material in a solution of hydro-sulphate of ammonia and a metallic sulphide, as sulphide of silver.

531,158—December 18, 1894. H. DE CHARDONNET. *Process of manufacturing artificial silk.*

Hydrated pyroxylin—differing from ordinary pyroxylin by containing at least 25 per cent of water and of greater solubility—is produced by treating pyroxylin while still moist with hydrated ether; which hydrated pyroxylin is dissolved to form collodion and spun into threads by discharging through nozzles; certain substances may be added to increase the fluidity. The spun collodion is denitrated by immersion in a bath formed by mixing calcium monosulphide, sulphate of ammonia and water, and removing the precipitate; the bath may be regenerated by adding sulphuric acid, and then calcium monosulphide and separating the precipitate.

546,360—September 17, 1895. J. H. STEVENS AND E. D. HARRISON. *Production of imitation onyx from pyroxylin compounds.*

A rod or sheet of pyroxylin composition in imitation of onyx, consisting of two or more light tints, with streaks of a darker color breaking through or interspersed with the lighter tints; produced by forming the light-tinted parts in solidified strata, cutting through these strata across the edges, inserting coloring matter or pyroxylin of a different color between the cut parts, and then solidifying the whole into blocks or masses.

559,392—May 5, 1896. F. LEHNER. *Process of making artificial silk.*

Two solutions are formed; first, of silk waste digested with caustic alkali, or a solution of copper or a copper salt in ammonia, precipitated from such solution and finally dissolved in concentrated acetic acid; and, second, of a substance containing cellulose macerated with a solution of copper or a copper salt in ammonia, nitrated, and then partially denitrated; which two solutions are mixed and caused to pass through a congealing solution, as of oil of turpentine or other hydrocarbon, to form a thread. The thread is laid in a solution containing soluble glass, whereby it is rendered incombustible.

562,626—June 23, 1896. F. LEHNER. *Art of preparing artificial silk.*

Cellulose is gradually introduced into a nitrating bath and the temperature of the bath progressively raised as the cellulose is added, whereby a homogeneous mixture of tri and tetra nitrocellulose is obtained. The whole mixture is then maintained at the final temperature for several hours; the nitrating liquid separated by centrifugal action; the acid-moist resultant mass immersed in sulphuric acid; a vulcanized drying-oil then added; the mixture finally dissolved in a suitable solvent, such as acetone, an alcohol, or alcohol ether; then the thread is drawn and the same immersed in warm water, then dipped in a solution of ammonium or other alkali hydrosulphide and a neutral magnesium salt at 40° C. (keeping the same therein until the rainbow colors of cellulose are visible under the microscope in polarized light), and finally washed, dried, and finished.

562,732—June 23, 1896. F. LEHNER. *Process of and apparatus for making artificial silk.*

A ground solution is passed into a bath free from oxygen—as of a hydrocarbon, such as oil of turpentine—and the thread drawn from the bath. The ground solution consists of resin, linseed oil, nitrocellulose, and an inorganic salt to render the thread incombustible.

563,214—June 30, 1896. H. M. TURK. *Composition of matter for manufacturing artificial silk.*

It consists of nitrocellulose, 96 parts; gelatin or isinglass, 2 parts; and albumin, 2 parts; dissolved in 1,600 parts of glacial acetic acid.

587,097—July 27, 1897. A. L. KENNEDY. *Composition of matter and article treated therewith.*

A coating solution for the surface of leather and other similar materials, consisting of 1 gallon of amylacetate, 12 ounces of nitrocellulose, 10 ounces of lanolin, and 3 ounces of corn oil, mixed and combined with aniline or other coloring matter.

590,842—September 28, 1897. A. L. KENNEDY. *Waterproof cloth and process of making same.*

A fabric having its face portions composed of natural fibers and its inner portions composed of threads or strands impregnated with a salt of cellulose, whereby ordinary unglazed or uncoated and nappy faces are presented, produced by entwining ordinary threads along with strands of undissolved soluble salt of cellulose to form a fabric, and then subjecting it to a solvent of the salt of cellulose to dissolve the extra strands and cause the dissolved salt to impregnate the ordinary threads.

600,824—March 15, 1898. J. H. STEVENS AND M. C. LEFFERTS. *Process of manufacturing pyroxylin sheets.*

A nonoxidizing solution of a pyroxylin compound is caused to flow in the form of a moving, continuous, fluid sheet, as onto a revolving drum, the thickness of the sheet being regulated by removing the surplus solution, and the volatile ingredients are then evaporated.

601,927—April 5, 1898. F. G. ANNISON. *Enameled paper and compound used to enamel same.*

An enameled paper adapted to receive and retain printing and lithographic impressions, the enamel consisting of a nitrocellulose compound containing oil and pigment, the latter being larger than or in excess of the nitrocellulose.

602,159—April 12, 1898. E. D. HARRISON AND C. H. THURBER. *Method of producing pyroxyline imitations of mosaic.*

Pyroxylin compounds are formed into sticks or rods; coated with a dyeing substance; arranged side by side; welded into a block; and sheets are then cut therefrom.

602,797—April 19, 1898. F. G. ANNISON. *Art of coating fabrics or permeable materials with nitrocellulose compounds and product produced thereby.*

A flexible permeable base is first impregnated to the desired depth with a liquid solution of the compound, dried, and then one or more coats of a heavier solution of the compound are applied, each dried in turn; the coat may be finally compacted by heat and pressure, with or without embossing.

603,001—April 26, 1898. W. H. WOOD AND J. H. STEVENS. *Waterproof fabric.*

A waterproof fabric having two or more successive coatings of a flexible pyroxylin compound, the under coating being more flexible than the upper coat or coatings, as, for example, the inner stratum being richer in oil than the outer stratum.

603,526—May 3, 1898. J. R. FRANCE. *Method of manufacturing pyroxylin compounds in imitation of marble.*

Pyroxylin compounds of different colors are produced; formed into fragments; dipped into a dye dissolved in a solvent of pyroxylin, and the dipped fragments calendered together to form sheeting; which may be compressed into blocks and cut.

608,726—August 9, 1898. J. H. STEVENS. *Pyroxylin compound.*

A composition of pyroxylin, and a lead salt of a volatile monatomic fatty acid, as lead acetate, capable of transparent effects.

608,727—August 9, 1898. J. H. STEVENS. *Pyroxylin compound.*

A composition of pyroxylin and lactamid, capable of transparent effects.

609,475—August 23. 1898. J. H. STEVENS. *Pyroxylin compound.*

A composition consisting of pyroxylin and a salt of camphoric acid, as sodium camphorate.

610,566—September 13, 1898. J. H. STEVENS. *Pyroxylin compound.*

A composition consisting of pyroxylin and a manganese salt of the volatile monatomic series of fatty acids, as acetate of manganese.

610,615—September 13, 1898. J. H. STEVENS. *Pyroxylin compound.*

A composition of pyroxylin and a lactophosphate, as lactophosphate of calcium.

610,953—September 20, 1898. J. H. STEVENS. *Pyroxylin compound.*

A composition of pyroxylin and a salt of hypophosphorous acid, as sodium hypophosphite; capable of transparent effects.

612,066—October 11, 1898. J. H. STEVENS. *Waterproof fabric.*

A fabric coated or impregnated with a pyroxylin compound containing a nondrying oil, as castor oil, and a salt containing a halogen element, as zinc chloride.

612,067—October 11, 1898. J. H. STEVENS. *Waterproof fabric.*

A fabric waterproofed by a pyroxylin compound which contains pyroxylin, castor oil, and a salt which contains an aromatic acid, as salicylate of soda.

612,531—October 18, 1898. J. H. STEVENS. *Pyroxylin compound.*

A composition of pyroxylin and a lithium salt of a volatile monatomic fatty acid, as lithium acetate; capable of transparent effects.

612,553—October 18, 1898. J. H. STEVENS. *Waterproof fabric.*

A fabric coated or impregnated with a pyroxylin compound consisting in part of castor oil and a salt or compound containing the phenoylic radical C_6H_5O, as sulphocarbonate of soda.

613,400—November 1, 1898. J. H. STEVENS. *Pyroxylin compound.*

A composition of pyroxylin and a salt of succinic acid having an inorganic base, as potassium succinate.

614,514—November 22, 1898. J. H. STEVENS. *Pyroxylin compound.*

A composition of pyroxylin and an inorganic salt of a halogen acid derived from the volatile members of the monatomic series of fatty acids, as an inorganic salt of chloracetic acid.

615,319—December 6, 1898. J. H. STEVENS. *Waterproof fabric.*

A fabric waterproofed by a pyroxylin compound which contains pyroxylin, oil, camphor, and naphthol.

615,446—December 6, 1898. B. B. GOLDSMITH. *Finishing fibrous or absorbent surfaces.*

A coat or coats of an aqueous solution of casein or casein compound is first applied, and then one or more coats of pyroxylin varnish, with or without finishing coats of gloss varnish.

617,450—January 10, 1899. J. H. STEVENS. *Pyroxylin composition.*

A composition containing pyroxylin and a urea salt of an acid of the aromatic series containing carboxyl (COOH), as urea benzoate; capable of transparent effects.

619,037—February 7, 1899. J. R. FRANCE. *Pyroxylin imitation of mosaic and method of manufacturing same.*

A pyroxylin imitation of mosaic, produced by forming pieces of pyroxylin compounds of different colors, form, and size, dipping them in a dye dissolved in a solvent of pyroxylin, pressing the dipped pieces into cakes, and cutting sheets therefrom.

621,382—March 21, 1899. J. H. STEVENS. *Pyroxyline compound.*

A composition containing pyroxylin and a salt of an acid of the aromatic series containing carboxyl (COOH), said salt having an inorganic base, as sodium benzoate, capable of transparent effects.

621,434—March 21, 1899. J. H. STEVENS. *Transparent pyroxylin plastic composition.*

A solid transparent composition consisting of pyroxylin, camphor, and a preserving potassium salt of a volatile monatomic fatty acid, as potassium acetate, the said salt not exceeding 3 per cent by weight of the pyroxylin.

622,290—April 4, 1899. J. H. STEVENS. *Transparent pyroxylin plastic composition.*

A solid transparent composition consisting of pyroxylin, camphor, and a preserving sodium salt of a volatile monatomic fatty acid, as sodium acetate, the said salt not exceeding 3 per cent by weight of the pyroxylin; the best effects being attainable with about 1 per cent.

622,291—April 4, 1899. J. H. STEVENS. *Transparent pyroxylin plastic composition.*

A transparent solid composition consisting of pyroxylin, camphor, and a preserving calcium salt of a volatile monatomic fatty acid belonging to the group which consists of calcium propionate and calcium butyrate; the said salt never more than 3 per cent and for proper proportions should not exceed 1 per cent.

622,292—April 4, 1899. J. H. STEVENS. *Transparent pyroxylin composition of matter.*

Barium butyrate is mixed with pyroxylin, not to exceed 5 per cent.

622,293—April 4, 1899. J. H. STEVENS. *Transparent pyroxylin plastic composition.*

It consists of pyroxylin, camphor, a liquid solvent, and an inorganic salt of lactic acid, as the lactates of potassium, strontium, calcium, sodium, and barium, the salt not to exceed 5 per cent of the pyroxylin; preferably about 1 per cent.

622,294—April 4, 1899. J. H. STEVENS. *Transparent pyroxylin plastic composition.*

A solid transparent composition consisting of pyroxylin, camphor, and a preserving zinc salt of a volatile monatomic fatty acid, as zinc formate, zinc acetate, zinc propionate, etc., the salt not exceeding 5 per cent of the pyroxylin.

622,727—April 11, 1899. J. H. STEVENS. *Flexible skin or fabric.*

A fabric waterproofed by a pyroxylin compound which contains pyroxylin, castor oil, beta-naphthol, and amyl acetate.

625,313—May 23, 1899. L. L. BÉTHISY. *Uninflammable nitrocellulose product*

It is composed of nitrocellulose with a binder rendered incombustible by the presence of zinc chloride, as alcohol, essential oil, vaseline oil, acetic ether, zinc chloride, and white gelatine.

626,732—June 13, 1899. J. H. STEVENS. *Pyroxylin composition.*

A composition of pyroxylin and strontium butyrate; capable of transparent effects.

651,364—June 12, 1900. I. KITSEE. *Compound useful as a substitute for rubber.*

A composition consisting of a glue compound—as employed for printers' rolls—and celluloid.

657,535—September 11, 1900. C. G. HAGEMANN AND F. O. C. ZIMMERMANN. *Manufacture of celluloid.*

A product consisting essentially of gelatinized nitrocellulose and a hydrate or hydroxid of a metal, as sulphate of alumina, produced by molecularly combining with a solution nitrocellulose; a concentrated solution of a hydrate or hydroxid of a metal; reacting with a concentrated solution of caustic soda; removing the cellulose solvent and soluble constituents; drying, and gelatinizing the compound with a solvent of nitrocellulose holding camphor in solution.

662,961—December 4, 1900. A. N. PETIT. *Solvent material for treating surfaces of celluloid.*

A mixture of a solvent of celluloid and a fatty acid or like material, as amyl acetate and oleic acid.

663,739—December 11, 1900. J. DUQUESNOY. *Process of making artificial-silk thread.*

Nitrocellulose is dissolved in a solvent composed of equal parts of acetone, acetic acid, and amyl alcohol, and expressed from a capillary orifice.

665,975—January 15, 1901. A. PETIT. *Composition of matter for manufacturing artificial silk threads.*

The composition consists of 100 pounds of dry nitrocellulose, 7 pounds of india-rubber solution, and 5 pounds of stannous chloride, mixed with sufficient solvent to bring it to the required consistency.

VISCOSE.

520,770—June 5, 1894. C. F. CROSS, E. J. BEVAN, AND C. BEADLE. *Plastic compound of cellulose.*

A soluble plastic compound derived from cellulose, caustic alkali, and carbon di-sulphide; as by treating cellulose, saturated with a strong solution of caustic soda, in a chamber with carbon di-sulphide.

530,826—December 11, 1894. C. F. CROSS AND E. J. BEVAN. *Manufacture of cellulose acetate.*

The intermediate product manufactured by mixing cellulose hydrate with zinc acetate solution and drying and dehydrating, is treated with acetyl chloride, the crude product of the reaction washed, pressed, and dried, and then treated with chloroform, whereby a solution of cellulose acetate is obtained free from cellulose and the solvent finally evaporated.

571,530—November 17, 1896. R. LANGHANS. *Method of and composition for making artificial silk.*

A noninflammable silk, produced from cellulose and other analogous carbohydrates by purifying the material, subjecting it to the action of phosphosulphuric, sulphuric, and phosphoric acids until a viscid syrup is obtained, increasing the stability of the syrup by treatment with an ethyl ester, drawing it into a filament, removing the acid, and hardening.

604,206—May 17, 1898. C. F. CROSS, E. J. BEVAN, AND C. BEADLE. *Modification of cellulose and method of preparing same.*

A structureless insoluble modified cellulose, obtained by first treating cellulose with caustic alkali and carbon di-sulphide (No. 520,770), and then decomposing the soluble mass thus obtained, as, for example, by exposure to heat above 100° C. or by exposure to steam at the same temperature.

617,009—January 3, 1899. M. FREMERY AND J. URBAN. *Process of manufacturing artificial silk.*

Cellulose is dissolved, without decomposing the same, in a cupro-ammonium salt solution and caused to flow in a thread or fiber-like stream into a bath containing a precipitant of cellulose, such as an acetic-acid solution, whereby the cellulose is precipitated from its solution in a thread or fiber-like form. The thread is wound within the bath as precipitated, then unwound and wound outside the bath, and simultaneously subjected to the action of a drying agent.

625,033—May 16, 1899. J. F. HOYNE. *Process of manufacturing fiberless thread.*

Cellulose is dissolved in a basic solution of zinc nitrate, chloride, or other zinc salts, filtered, and pressed through small holes into methylated spirits—thereby coagulating the cellulose—when the threads are strained nearly to breaking and dried under strain.

634,571—October 10, 1899. J. C. CHORLEY. *Method of producing cellulose films for photographic or other purposes.*

Films of any desired length are produced by a continuous operation by supplying viscose in a regulated and evenly distributed quantity or film, heating the gradually moving film, and simultaneously subjecting it to a current of air traveling in the opposite direction, and subjecting the film to the action of boiling brine to decompose the viscose and regenerate the insoluble cellulose in film form.

646,044—March 27, 1900. E. THOMAS, J. BONAVITA, AND M. OLIVIER. *Manufacture of viscose.*

To alkali cellulose there is added 25 to 30 per cent of sodium sulphite, and about 30 per cent of zinc oxide, calculated on the cellulose contained in the alkali cellulose, and the mixture is then treated with carbon disulphide; the product being free from the objections of color and odor heretofore attaching to viscose.

646,351—March 27, 1900. E. BRONNERT. *Production of cellulose solution for manufacturing threads.*

Clean cellulose is treated with a concentrated caustic alkali lye, washed with much water, treated for two to four hours with a weak bleaching liquor, submitted to centrifugal action, and finally dissolved while wet in an ammoniacal solution of cupric oxide.

646,381—March 27, 1900. E. BRONNERT. *Production of cellulose solutions for manufacturing threads.*

Cellulose in a finely divided state is treated for about one hour with a cold, concentrated solution of caustic alkali, then the product is mixed with a powdered copper salt—such as copper sulphate—in proportion equivalent to the caustic alkali used, avoiding a rise in temperature, and finally the product is dissolved in strong ammonia solution.

646,799—April 3, 1900. E. BRONNERT. *Process of producing solutions of cellulose.*

Cellulose, freed from fat and bleached, is treated with concentrated caustic-alkali solution, as in the mercerizing process, at a low temperature, then submitted to centrifugal action and washed, then treated with an oxidizing agent, and after again washing and submitting to centrifugal action, it is dissolved directly in concentrated zinc-chloride solution.

648,415—May 1, 1900. W. H. KRUG. *Substitute for horn and process of manufacturing same.*

A vegetable tissue, as pith, is subjected to the action of an alkali solution, washed and ground, the nongelatinized fibers removed by washing, and the resultant mass drained and dried.

650,715—May 29, 1900. M. FREMERY AND J. URBAN. *Process of manufacturing cellulose products.*

Cellulose products, as threads and films, are subjected for a short time to the action of water at an elevated temperature of from 60° to 100° C., and then dried at a comparatively low temperature not exceeding 40° C., to impart a glossy appearance and a comparatively great strength.

665,975—January 15, 1901. A. PETIT. *Composition of matter for manufacturing artificial silk threads.*

It consists of about 100 pounds of dry nitrocellulose, 7 pounds of india-rubber solution, and 5 pounds of stannous chloride, mixed with a sufficiency of solvent to bring it to the required consistency.

RUBBER AND RUBBER SUBSTITUTES.

240—June 17, 1837. C. GOODYEAR. *Improvement in the process of divesting caoutchouc, gum-elastic, or india-rubber of its adhesive properties, and also of bleaching the same, and thereby adapting it to various useful purposes.*

The adhesiveness of the surface of caoutchouc is destroyed by the application of an acid solution of the metals, as, for example, a nitrate of copper or a nitrate of bismuth. Caoutchouc paste is bleached by incorporating therewith lime, preferably quicklime.

1,090—February 24, 1839. N. HAYWARD (ASSIGNOR TO C. GOODYEAR). *Improvement in the mode of preparing caoutchouc with sulphur for the manufacture of various articles.*

Sulphur is combined with caoutchouc, either in solution, as in oil of turpentine, or in substance, causing the gum to dry more perfectly and to improve the whole substance.

3,633—June 15, 1844. C. GOODYEAR. (*Reissues: 156 and 157—December 25, 1849; 1,084—November 20, 1860.*) *Improvement in process for manufacture of india-rubber.*

India rubber, combined with or in the presence of sulphur, is cured by subjecting it to a high degree of artificial heat, say, from 212° to 350° F., or approaching 270° F.; or a carbonate or other salt or oxide of lead is added, as india rubber 25 parts by weight, sulphur 5 parts, and white lead 7 parts. Layers of cotton batting may be interposed between those of the gum.

4,005—April 22, 1845. N. GOODYEAR. *Improved method of manufacturing india-rubber cloth and sheet india rubber.*

The gum is impregnated with grit, iron or other metal filings, or other hard substances.

5,592—May 23, 1848. R. A. BROOMAN. *Applications of the substance called gutta-percha alone or in combination with other substances to certain manufacturing uses and purposes and the modes or processes of preparing, combining, and applying the same.*

Gutta-percha is freed of foreign matter by soaking in water and squeezing between rolls, then kneaded in a machine, when it may be mixed with caoutchouc or sulphur or both, and pigments. If caoutchouc is added, a degree of heat not less than 150° F. is necessary to effect the amalgamation. Pulverized chalk or other soft powder may be added, or ground emery, sand, or other hard substance. It is employed in manufacture by molding, stamping, or is used for enveloping. It is reduced to a powder and employed in the making of casts, forms, and impressions in relief, the mold or surface being heated until the material becomes ductile and fills all parts of the mold or form.

8,075—May 6, 1851. N. GOODYEAR. (*Reissues: May 18, 1858—556-557.*) *Improvement in the manufacture of india rubber.*

A combination of india rubber, sulphur, and magnesia, or lime, or a carbonate, or a sulphate of magnesia, or of lime, with or without shellac for making a hard and inflexible substance.

10,714—April 20, 1886. A. KISSEL. *Hardening resins.*

Resins or resinous products are hardened by partially or wholly neutralizing the contained acid or acids with caustic lime or other caustic alkaline earth.

11,096—June 13, 1854. THOMAS, EARL OF DUNDONALD. *Improvement in compositions for coating telegraph wires and for other purposes.*

A compound of bitumen, asphaltum, or mineral pitch, 75 parts; india rubber, 15 parts; and 10 parts of a mixture formed by dissolving gum shellac (1 part) and resin (4 or 5 parts) in oil of petroleum, dead-oil, or naphtha, with steam heat.

15,067—June 10, 1856. A. G. DAY. (*Reissues: 756 and 757—July 12, 1859.*) *Improvement in cleansing caoutchouc.*

Alkali or its equivalent is used for separating bark, sticks, etc., from crude caoutchouc and other vulcanizable gums. The caoutchouc is charged with alkaline liquor by means of an exhausting apparatus.

21,122—August 10, 1858. A. G. DAY. (*Reissues: 620—November 9, 1858; 5,230, 5,231, and 5,232—January 14, 1873.*) *Improvement in hard rubber.*

A mixture of 2 parts by weight of india rubber or other vulcanizable gum, and 1 part of sulphur, vulcanized at a temperature commencing at about 275° F. and carried to 300° or upward.

25,110—August 16, 1859. C. GOODYEAR. *Porous india-rubber cloth.*

A woven or equivalent fabric having a thin porous coating of india rubber or allied gum.

25,192—August 23, 1859. C. GOODYEAR. *Porous napped india-rubber fabric.*

A fabric composed of cloth and india rubber rendered pervious to air, by having fibers incorporated therewith, and impervious to water, with a face of flocks, clippings, or shavings of woolen or other fibers.

26,698—January 3, 1860. J. MURPHY. *Improvement in treating waste and inferior gums.*

The process consists in: First, the manufacture of hard stock of vulcanizable gum by blending it with sulphur and vulcanizing; second, the reduction of the hard stock to powder; third, the formation of a compound of the ground stock and raw gum by blending; and, fourth, the vulcanization of this compound.

27,770—April 10, 1860. J. M. BATCHELDER. *Improvement in insulation of submarine telegraph wires.*

A telegraph wire or other conductor of electricity insulated with a compound substance composed of pulverized silex, glass, or other nonconducting material mixed with india rubber and sulphur and subsequently vulcanized.

27,837—April 10, 1860. C. F. E. SIMON. *Improvement in restoring waste vulcanized rubber.*

Ground or cut waste of vulcanized india rubber is mixed with chloride of lime (100 parts of rubber waste and 2 parts of chloride of lime) and exposed to a heat of 900° to 1,200° F., with stirring, till the volitilization of the sulphur is complete.

29,717—August 21, 1860. A. C. RICHARDS. *Improvement in devulcanizing waste rubber.*

Rubber waste is ground to powder and treated with steam in a closed vessel at a temperature of over 600° F.

30,181—September 25, 1860. DU B. D. PARMELEE. *Improvement in restoring waste vulcanized rubber.*

Waste rubber is powdered and then combined with india rubber which has been modified by heat, so as to obtain it either in a semiliquid or melted condition or in a liquid or vaporous condition.

31,240—January 29, 1861. R. F. H. HAVEMANN. *Improvement in compositions of caoutchouc.*

A substitute for ivory and bone produced by the admixture of oxide of zinc with chlorine-treated rubber or its chlorine-treated allied gums, in the proportion, say, of one part of zinc oxide to two parts of gum.

31,241—January 29, 1861. R. F. H. HAVEMANN. *Improvement in compositions of caoutchouc.*

A substitute for wood, ivory, and bone produced by the admixture with chlorine-treated rubber or its chlorine-treated allied gums, of one-eighth of a dram of aqua-ammonia, one-eighth of a dram of powdered carbonate of ammonia, and half a pound of lime, per pound of gum, with pressure and heat.

33,094—August 20, 1861. C. McBURNEY. *Improvement in utilizing waste vulcanized rubber.*

Comminuted waste rubber is treated with an oil having no solvent action upon the gum, such as resin oil, castor oil, etc.

34,309—February 4, 1862. T. J. MAYALL. *Improvement in restoring waste rubber.*

Vegetable tar or pine oil is combined or incorporated with waste vulcanized rubber.

40,407—October 27, 1863. C. H. & D. E. HAYWARD. *Improvement in treating waste rubber.*

Waste rags of fibrous material and rubber are boiled in an acid or alkali to destroy the tenacity of the fibers of the rags, so that the rubber may be reground and the material will not blister when reused.

40,491—November 3, 1863. T. J. MACKALL. *Improvement in restoring waste rubber.*

Rubber waste is reduced to a fine condition and then subjected to the direct action of the flames of gas or inflammable liquids.

46,610—February 28, 1865. E. L. SIMPSON. *Improvement in the process of manufacturing india rubber, gutta-percha, etc.*

A concentrated preparation of sulphur and linseed or other vegetable oil is employed in the manufacture of india rubber, to produce a product free from the disagreeable odor and deleterious effects of vulcanized rubber.

46,750—March 7, 1865. S. C. BISHOP. *Improved composition for insulating telegraph wires.*

A mixture of gutta-percha or india rubber, 4 parts; paraffine, 1 part; wheat flour, 2 parts; and resin, 1 part; or in lieu of this gutta-percha or india rubber, 6 parts; paraffine, 2 parts; white oxide of zinc, 1 part; catechu, 1 part; and gelatine or glue, 2 parts; mixed in solution or by heated rolls.

51,331—December 5, 1865. F. MARQUARD. (*Reissue: 2,180—February 20, 1866.*) *Improvement in the manufacture of white rubber.*

After bleaching with chlorine gas the rubber or like gum is washed with hot water. It is then subjected to distillation. The product after straining, pressing, and drying, is redissolved in a small quantity of chloroform mixed with phosphate of lime, and subjected to pressure in hot molds.

51,332—December 5, 1865. E. MARQUARD. (*Reissue: 2,179—February 20, 1866.*) *Improvement in the manufacture of white rubber.*

Rubber dissolved in chloroform (or other solvent) is bleached by treatment with caustic ammonia gas or chloride of ammonia. It is then washed with hot water, subjected to distillation, and redissolved as in No. 51,331, and combined with phosphate of lime or a carbonate of zinc by means of pressure in hot molds.

54,523—May 8, 1866. C. L. FRINK. (*Reissues: 4,942—June 11, 1872; 6,014—August 11, 1874.*) *Improvement in vulcanized rubber compounds for packings and other purposes.*

A vulcanized rubber compound formed of rubber, 10 parts; plumbago, 20 parts; carbonate of lead or litharge, 6 parts; sulphur, 4 parts, and brass or other metal filings, 6 parts.

54,554—May 8, 1866. N. JENKINS. (*Reissue: 3,579—August 3, 1869.*) *Improvement in the manufacture of elastic packing.*

An elastic packing, composed of at least four-tenths of finely pulverized refractory earthy material, such as French chalk, mingled with rubber, prepared for vulcanizing and then vulcanized.

58,615—October 9, 1866. A. G. DAY. (*Reissues: 6,707—October 19, 1875, product; 6,708—October 19, 1875, process.*) *Improvement in artificial caoutchouc.*

Vegetable and mineral oils are combined with gum-resins or other resinous bodies, and sulphur at a temperature sufficient to produce vulcanization; the oils and resins are first mixed under heat, and the sulphur then added and the temperature increased. It may be mixed with india rubber or gutta-percha.

62,055—January 26, 1867. W. MULLEE. *Improvement in process of preparing india rubber.*

Thin sheets of rubber are suspended in a bath of melted sulphur heated to 220° to 230° F., then removed, the crystals of sulphur formed thereon removed, and a pile of the sheets are then kneaded, worked, and vulcanized.

83,031—October 13, 1868. S. C. BISHOP. *Improved compound for insulating telegraph and electric wires.*

It consists of $2\frac{1}{2}$ pounds of asphaltum, one-quarter pound of gutta-percha, one-quarter pound of crude resin, half a gallon of spirits of turpentine, with about 1 gill of boiled linseed oil and 2 ounces of umber.

94,631—September 7, 1869. S. MOULTON. *Improved printers' inking roller from rubber sponge.*

To obtain a substance of a mossy nature, vulcanized india rubber is pulverized and subjected to a second vulcanization.

97,880—November 17, 1869. E. CHESTERMAN. *Improvement in the manufacture of rubber sponge.*

Artificial sponge is made by incorporating into a homogeneous mass, on hot rolls, specified ingredients—salt, salts of soda, alum, or other deliquescent or soluble solid not affected by moderate heat, either with or without such liquids as molasses, etc.—and afterwards expanding, revulcanizing, and setting. It is expanded by treatment in a hot water, steam, or other bath. Color is imparted by the use of golden sulphuret of antimony incorporated with the compound.

137,509—April 1, 1873. W. A. TORREY. *Improvement in vulcanized rubber compounds.*

Mica is combined with rubber prior to vulcanization.

140,281—June 24, 1873. D. M. LAMB. *Improvement in the production of waterproof gum.*

Waterproof gum made from the inspissated juice of plants of the asclepias or milkweed family, or any of the analogous plants possessing like properties.

140,282—June 24, 1873. D. M. LAMB. *Improvement in the production of waterproof gums.*

A waterproof gum is extracted from plants of the asclepias or milkweed family, by subjecting the plants to fermentation, and inspissating the resulting liquid by evaporation.

140,283—June 24, 1873. D. M. LAMB. *Improvement in preparing waterproof gums from flaxseed, etc.*

A vulcanizable gum is produced from flaxseed or other seeds possessing similar properties—as rape and cottonseed—by maceration, straining, and subsequent inspissation.

142,908—September 16, 1873. C. L. FRINK. *Improvement in rubber compounds for the manufacture of packings, etc.*

A mixture of india rubber or other vulcanizable gum with sulphur and other solid materials, such as various earths, oxides, metal filings, and the like, forming a nonvulcanized but vulcanizable compound; that is, vulcanized in the place to be packed.

146,158—January 6, 1874. S. W. ANDREWS AND L. GODFREY. *Improvement in compositions of rubber for use in separating cockles from grain.*

A vulcanized composition of 8 ounces of linseed oil and 2 ounces of chalk; 8 pounds of zinc white; and 4 pounds of rubber gum, with sufficient sulphur. It is vulcanized at 260° F. for not to exceed 3 hours and then subjected to a heat of about 212° F. for two hours, more or less.

146,387—January 13, 1874. P. FINLEY. *Improvement in the preparation and treatment of india-rubber varnish.*

Dehydrated or baked india rubber, produced by heating sliced or comminuted india-rubber at a temperature of from 138° to 160° C. for seven to ten hours. It is combined with sulphur and benzine or other solvent of india rubber to form a varnish.

153,447—July 28, 1874. L. O. P. MEYER. *Improvement in processes of producing vulcanized soft india-rubber goods.*

Paraffin is used in covering the plastic compound with sheets or forms of metal preparatory to vulcanization.

153,448—July 28, 1874. L. O. P. MEYER. *Improvement in soft vulcanized india rubber with glossy surface.*

Soft vulcanized rubber having a glossy surface: produced by process No. 153,447.

153,449—July 28, 1874. L. O. P. MEYER. *Improvement in processes for the production of hard rubber or vulcanite with cloth surface or surfaces.*

A thin coat of soft vulcanizable india rubber is applied between the cloth and the hard compound and then vulcanized.

168,129—September 28, 1875. M. W. BEYLIKGY. *Improvement in extracting rubber from waste.*

Rubber solutions are solidified through the agency of a current of air circulating over the surface of the solution, through a condenser to deposit the volatile solvent, then through a heater and back to the solution vessel.

179,576—July 4, 1876. W. D. LATHAM. *Improvement in cement.*

A cement composed of 1 ounce of crude gutta-percha, 5 grains of india rubber, and 1 pound of chloroform.

180,484—August 1, 1876. G. MAGNUS. *Improvement in compositions for billiard balls and processes of manufacturing the same.*

A mixture of india rubber, sulphur, sulphate of baryta—the latter in quantity at least 50 per cent of the rubber—and coloring matter; the composition is subjected, in molds, to a slowly increasing heat for ten hours or more.

210,405—December 3, 1878. A. G. DAY. *Improvement in the combination of vegetable oils and grahamite for the manufacture of vulcanized compounds.*

A kerite product, formed by the combination of grahamite or its equivalent with another resinous body, and with vegetable oil and sulphur: as by mixing cottonseed oil, liquid coal tar, and grahamite with a small quantity of oxide of zinc, heating to about 330° F., cooling to 200° F., and adding linseed oil, and then raising the temperature slightly and adding the sulphur.

210,406—December 3, 1878. A. G. DAY. *Improvement in compounds for the manufacture of kerite.*

Clay or other equivalent earth is mixed as an absorbent with the oils, resinous bodies, and sulphur in the manufacture of kerite.

210,407—December 3, 1878. A. G. DAY. *Improvement in compounds of india rubber and kerite.*

A vulcanized product consisting of the combination of crude kerite with natural india rubber.

210,408—December 3, 1878. A. G. DAY. *Improvement in the manufacture of kerite from gums and oils.*

A vulcanized compound composed of vegetable or mineral oils, a resinous body or bodies, and sulphur; as cottonseed oil, linseed oil, coal tar, and sulphur, and preferably wax with or without paraffin or ozocerite.

210,409—December 3, 1878. A. G. DAY. *Improvement in the manufacture of kerite.*

The process of making a vulcanized product by combining crude kerite or artificial caoutchouc with natural india rubber.

210,410—December 3, 1878. A. G. DAY. *Improvement in preparing vegetable oils for the manufacture of kerite.*

Vegetable oils are subjected to the action of sulphur at a high temperature, as 520° F.

210,411—December 3, 1878. A. G. DAY. *Improvement in the manufacture of artificial caoutchouc or kerite.*

The process of making a vulcanized compound by combining cottonseed oil, coal tar (or pitch or bitumen), linseed oil, and sulphur, with or without vegetable or animal wax, ozocerite, and oxide of iron.

211,340—January 14, 1879. J. MURPHY. *Improvement in vulcanized india-rubber valves.*

Composed of vulcanized rubber and gutta-percha, in the proportions of 2 parts of the former to 1 part of the latter, with or without the addition of metallic earths and oxides; it will resist the action of oils.

216,153—June 3, 1879. D. F. CONNELL AND E. FAGAN. *Improvement in hard rubber compounds.*

Strips or shreds of metal foil are incorporated with caoutchouc prior to vulcanization.

218,842—August 26, 1879. J. W. WATTLES. *Improvements in treating vulcanized india rubber or caoutchouc.*

Vulcanized rubber is treated in a bath of acetic acid, or it is otherwise applied to increase its strength and elastic force.

219,033—August 26, 1879. J. STEPP. *Improvement in the modes of covering wooden and other articles with india rubber.*

Gum is first applied in solution, then the article is covered with a vulcanizable compound and the article subjected to liquid pressure during the process of vulcanization.

226,017—March 30, 1880. C. V. BEACH. *India rubber and other gum compounds for surfacing cloth, and for other purposes.*

Rubber and other gum compounds are deodorized by combining therewith gum benzoin, say 5 per cent, or benzoic acid alone.

226,057—March 30, 1880. H. GERNER. *Process of the treatment of india rubber, etc.*

The process consists in washing india rubber and like gums in warm water in which is dissolved some soda, then cutting into small particles, then freezing, then grinding in a frigid mill, again washing in cold water, then subjecting to the action of solvents in a closed vessel and mixing with desired substances and completing the manufacture.

226,058—March 30, 1880. H. GERNER. *Manufacture of goods from caoutchouc, etc.*

The process consists in first mixing dissolved camphor and sulphur, then evaporating the moisture of the camphor solvent and mixing with caoutchouc and vulcanizing. The rubber compound consists of equal parts of dissolved camphor, sulphur, and caoutchouc.

226,070—March 30, 1880. L. M. HEYER. *Treating waste vulcanized caoutchouc.*

Rubber waste, after the removal of the sulphur by the direct action of heat, is subjected to the action of boiling water or steam until sufficiently fluid to strain, and then strained.

229,038—June 22, 1880. H. GERNER. *Manufacture of vulcanized india-rubber compounds.*

Camphor is mixed with sulphur—as by melting them together, cooling, and grinding—and incorporated with india rubber, with or without the addition of glycerine, and the mass vulcanized.

229,794—July 13, 1880. A. B. ALLEN. *Manufacture of substitutes for hard rubber.*

Hard wood and articles made therefrom are treated with resin oil at a slow heat, and afterwards coated with a solution of gutta-percha vulcanized on the wood.

229,817—July 13, 1880. H. GERNER. *Manufacture of vulcanized india-rubber products.*

A mixture of india rubber, camphor, and flour made from the seed of agricultural germs for the purpose of vulcanization.

232,974—October 5, 1880. A. B. & C. JENKINS. *Vulcanized plastic compound.*

Diatomaceous silica or insuferial earth is mixed with india rubber and gutta-percha, or either, and sulphur, and vulcanized.

233,296—October 12, 1880. E. M. STEVENS. *Enameled rubber cloth.*

The surface consists of substantially equal parts of boiled linseed oil, plastic rubber, and suitable body or coloring matter, combined together by heat before applying to the cloth, and hot calendered after application.

233,600—October 26, 1880. J. H. CHEEVER. *Process of reclaiming rubber from old and waste vulcanized rubber and utilizing the same in manufacturing rubber goods.*

Old vulcanized rubber is boiled with raw petroleum and the resulting product then mixed with new rubber and sulphur and exposed to vulcanizing temperature.

236,240—January 4, 1881. G. M. MOWBRAY. *Method of treating caoutchouc.*

Caoutchouc is treated with naphthaline to preserve the properties of elasticity, durability, etc., and the naphthalized caoutchouc mixed with elements not soluble in naphthaline for the formation of articles. The naphthaline is removed by spontaneous evaporation.

236,709—January 18, 1881. P. KROPP. *Composition for treating rubber cloth, etc.*

A composition for covering the rubber surface of cloth before printing, consisting of linseed oil boiled to a tough paste, with a small proportion of oxide of manganese, and of gum copal added, and then coloring matter equal in weight to the mass.

236,778—January 18, 1881. H. A. CLARK. *Process of desulphurizing and devulcanizing waste vulcanized india rubber.*

Vulcanized india rubber waste is first moistened with water and the water evaporated, and then moistened with turpentine, camphene or equivalent substance and the turpentine evaporated by heating.

236,779—January 18, 1881. H. A. CLARK. *Process of desulphurizing and devulcanizing waste vulcanized india rubber.*

Vulcanized india rubber is treated to the vapors of turpentine or camphene, after it has been boiled in water, to reduce the whole to a cohesive condition.

237,249—February 1, 1881. H. A. CLARK. *Treatment of vulcanized india rubber and gutta-percha.*

Waste vulcanized india rubber is treated with a vegetable oil, such as palm oil, and with a resinous matter.

243,782—July 5, 1881. T. J. MAYALL. *Compound substance for electric insulators.*

It consists of 1 pound of rubber, one-quarter of a pound to 2 pounds of graphite, and one-half pound to 2 pounds of sulphide or sulphuret of antimony, commingled and cured by heat.

244,788—July 26, 1881. L. BECKERS. *Treating caoutchouc with hydrocarbon oils.*

A waterproof compound consisting of, say, 1 part of caoutchouc to 4 parts of hydrocarbon oil of a boiling temperature of about 250° to 300° C.

245,328—August 9, 1881. J. H. TUTTLE. *Process of making sheet packing of rubber, paper, etc.*

Sheet packing provided with a metallic facing; formed by attachment to the face of any suitable fabric by means of rubber cement, or other adhesive material, metal filings or grindings, and subjecting the sheet to pressure. Sulphur may be added to the cement and the sheets vulcanized.

247,834—October 4, 1881. T. J. MAYALL. *Manufacture of hard rubber.*

The sulphides or sulphurets of antimony are mixed with rubber (without the addition of free sulphur) and cured by heat.

247,835—October 4, 1881. T. J. MAYALL. *Rubber veneer.*

A compound of rubber and sulphide (or sulphuret) of antimony, colored and cured by heat.

247,840—October 4, 1881. T. J. MAYALL. *Hard rubber compound called "artificial horn."*

A compound of rubber and sulphide (or sulphuret) of antimony and graphite, hardened by heat.

249,889—November 22, 1881. A. B. & W. P. BROWN. *Composition for coating metals.*

Composed of india rubber, gutta-percha, gum dammar, and wax, dissolved in benzole.

249,970—November 22, 1881. N. C. MITCHELL. *Recovering rubber from rubber waste.*

In the boiling of rubber waste in strong sulphuric or muriatic acid, steam is injected into the acid, whereby the steam penetrates the mass and carries the acid with it.

250,943—December 13, 1881. N. C. MITCHELL. *Recovering rubber from rubber waste.*

Rubber waste is first subjected to the action of hydrocarbon vapors to soften or disintegrate the mass, and then to the action of strong and highly heated sulphuric or muriatic acid.

252,216—January 10, 1882. H. W. HENDRICKS. *Elastic compound for truss-pads.*

It consists of glue, honey, sugar, gutta-percha, glycerine, borax, alum, black lead, sulphur, and saltpeter, in certain specified proportions.

254,205—February 22, 1882. G. A. FOWLER. *Temporary stopping for teeth.*

A composition of wax, 4 parts; oxide of zinc, 15 parts; gutta-percha, 8 parts; and chalk or whiting, 6 parts.

254,462—March 7, 1882. J. D. CHEEVER. *Waterproof and plastic composition.*

Waste rubber is rendered plastic by treatment with vaseline and sulphur, and mixed with short jute fiber or powdered bark, either or both.

254,463—March 7, 1882. J. D. CHEEVER. *Waterproof and plastic compound.*

To a compound of disintegrated fibrous material, earthy materials, sulphur, and vaseline there is added siccative oil treated with chloride of sulphur, the use of vaseline being claimed with any of the products derived from the siccative or drying oils. Also the products derived from the siccative or drying oils in combination with the plastic products obtained by heating waste vulcanized rubber with vaseline, for cementing pigments and fibers.

254,465—March 7, 1882. J. D. CHEEVER. *Waterproof and plastic compound.*

A product of the siccative oils, vaseline, and "pickum gum," produced by treating a solution formed of, say 160 pounds of linseed oil, 20 pounds of vaseline, and 40 pounds of pickum gum, dissolved with heat, with 9 pounds of protochloride of sulphur and 9 pounds of bisulphide of carbon, and granulating after cooling, and washing. A compound of the same is formed with powdered cork, tan bark, short fibers, and coloring matter.

256,470—April 18, 1882. G. S. EVANS. *Plastic composition and vulcanite.*

A plastic material suitable for waterproofing or vulcanization is formed from gums, such as gum kauri or gum manila, by mixing such gum with palm oil and then heating the mixture to about 400° F. The material is vulcanized by treating with chlorite of aluminum and heating.

258,021—May 16, 1882. C. CONNOR. *Rubber compound.*

It consists of a vulcanized mixture of india rubber, 1 pound; soda, 2 pounds; lime, 4 ounces; camphor, 3 drams; and sulphur, 1 ounce and 10 drams. It will stand a high degree of heat.

260,441—July 4, 1862. C. E. W. WOODWARD. *Process of treating india rubber.*

The surface of india rubber is subjected for a limited time to the action of concentrated sulphuric acid and immediately washed to prepare it for adhesion to other objects.

262,079—August 1, 1882. C. J. McDERMOTT. *Restoring rubber waste.*

Rubber waste or scrap is boiled in a solution of acid, bichronate of potash, and manganese, by means of live steam injected into the mass.

263,021—August 22, 1882. H. A. CLARK. *Treatment of india rubber and gutta-percha.*

Restored or devulcanized india rubber or gutta-percha with water is subjected to heat sufficient to evaporate the oils or spirits.

264,821—September 19, 1882. W. O. CALLENDER. *Composition of matter for insulating telegraph wires and for other purposes.*

It consists of 40 to 80 parts of bitumen and 20 to 60 parts of elastikon, or a residual product of vegetable oils, with sulphur or other vulcanizing agents.

265,184—September 26, 1882. J. C. TITZEL. *Process of treating vulcanized india rubber.*

Vulcanized india rubber is dissolved in turpentine and linseed oil; then sulphuric acid is added until the pigment or filling is all dissolved, when the mass is washed. A caustic potash solution is then added to saponify the oil, and the rubber is precipitated from the soapy mass.

276,916—May 1, 1883. W. SMITH. *Insulating electrical conductors and a new compound suitable to be used for this and other purposes.*

A mixture of gutta-percha and ground coal.

277,977—May 22, 1883. E. BAUER. *Process of and composition for the manufacture of substitutes for leather, horn, tortoise shell, etc.*

It is composed of gelatine or glue, $2\frac{1}{2}$ to 5 parts; glycerine, 3 parts to one-half part; fat or oil, 3 parts to one-half part; and caoutchouc, one-half to 1 part; when dried it is treated with tannic acid, the tanning process being accelerated by electric currents.

281,769—July 24, 1883. A. W. KENT. *Separating foreign substances from india-rubber waste.*

Ground or subdivided india-rubber waste is agitated in water within a sieve that supports the rubber, which allows the heavier substances to subside and the loose fibers to wash away.

284,760—September 11, 1883. H. A. ROBINSON. *Metallized rubber compound.*

A compound consisting of 10 parts of finely divided metal and 1 part of vulcanizable gum rendered plastic by a suitable solvent.

285,980—October 2, 1883. W. E. DOUD. *Rubber cement for the manufacture of memorandum blocks and tablets.*

It is composed of 1 part of pure rubber, 6 pounds of bisulphuret of carbon, and 1 pound of ultramarine.

286,442—October 9, 1883. M. HUGHES. *Plastic composition for tailors' cutting-boards, and for other purposes.*

A mixture of sawdust, 10 parts; rubber or gutta-percha, 5 parts; flour, 4 to 5 parts; and linseed oil or soap-boilers' waste, with or without the addition of a bituminous substance.

288,013—November 6, 1883. J. L. CHADWICK. *Method of reclaiming india rubber and fiber from scraps of india-rubber cloth.*

The scraps are first subjected to the action of muriatic acid to destroy the cotton fibers and release the wool from the rubber, leaving the wool intact; and then subjected to a beating and picking action to detach the wool from the rubber.

290,909—December 25, 1883. N. C. MITCHELL. *Rubber compound.*

Particles of leather are incorporated with the rubber compound previous to vulcanization.

292,891—February 5, 1884. A. O. BOURN. *Process of treating fibrous rubber waste.*

Rubber waste containing cotton fiber is subjected to the action of a sulphuric-acid solution of sufficient strength to operate as a solvent of the fiber—3 or 4 per cent solution—and permit its removal with the solvent.

295,615—March 25, 1884. A. O. BOURN. *Process of treating fibrous rubber waste for the recovery of the rubber or caoutchouc therefrom.*

Waste containing cotton fiber is treated with nitric or muriatic acid in solutions of sufficient strength to convert the fiber into soluble matter and permit its removal with the solution.

300,720—June 17, 1884. N. C. MITCHELL. *Recovering rubber from waste.*

Rubber waste is boiled in sulphuric or muriatic acid of a strength sufficient to eliminate and destroy the fibrous material including woolen fiber.

305,184—September 16, 1884. J. J. HAUG. *Substitute for caoutchouc.*

Skins and glycerine are boiled under pressure, then there is mixed with the mass glycerine and chromate or bichromate of potash or other suitable salt acted upon by light, with or without the addition of ground cork, oxgall, and color.

308,189—November 18, 1884. J. J. MONTGOMERY. *Devulcanizing and restoring vulcanized rubber.*

Finely cut particles of the rubber are heated in a closed vessel with hydrocarbon oils obtained from petroleum to above 350° F. until it is reduced to a complete solution, from which the oils remaining in the mass may or may not be extracted.

308,209—November 18, 1894. J. J. C. SMITH. *Manufacture of rubber compositions.*

A rubber compound, consisting of mineral wax or paraffin combined with resin, sulphur, and rubber: formed by first melting together resin, one-fourth to one-half pound, and ozocerite, or similar material, 1 pound, and mixing the same with 4 pounds of caoutchouc and 1 pound of sulphur.

311,135—January 20, 1885. C. J. McDERMOTT. *Recovering rubber from rubber waste.*

Fiber is eliminated from rubber scrap by boiling the scrap in dilute acid—say sulphuric acid of 12° Baumé—and afterwards washing the rubber; or a solution of sulphuric acid, salt, and manganese is used.

312,803—February 24, 1885. C. S. BRADLEY. *Electrical conducting material.*

It consists of gas-retort carbon or other carbon which has grit, and gutta-percha or india rubber vulcanized; may be vulcanized with bromine. The material is nonporous.

315,633—April 14, 1885. H. KELLOGG. *Electrical insulator.*

A mixture of 4 pounds of asphaltum, 4 ounces caoutchouc of oil, 1 ounce of asbestos, and 4 ounces india red; the asbestos and india red, either or both, may be omitted.

318,233—May 19, 1885. J. L. CLARK. *Manufacture and preparation of materials to be employed for insulating.*

A compound of oxidized oil and asphalt, pitch, or bitumen, with a small quantity of hydrocarbon oil or hydrocarbon spirit, with or without india rubber or gutta-percha, black wax or other elements to cheapen the mixture.

319,079—June 2, 1885. J. W. ELLIS. *Composition of matter for the preservation of paper or vegetable tibing used for the insulation of telegraph wires.*

A mixture of asphaltum, 40 parts; resin, 14 parts; petroleum or dead oil, 6 parts; vulcanized rubber, 3 parts, and sulphur, 1 part.

320,921—June 30, 1885. R. S. FERGUSON, W. SCHUMACHER, AND W. TUBMAN. *Compound for insulating electric wires.*

A mixture of pine pitch, 300 pounds; hard or soft rubber, $1\frac{1}{2}$ pounds; and liquid asbestos, 1 gallon, to which is added beeswax or tallow or linseed oil until of the proper consistency to render the compound hard and yet flexible when cool.

321,410—June 30, 1885. F. WILHÖFT. *Vulcanized soft rubber and process of making same.*

Vulcanized soft rubber in which all the sulphur is chemically combined with the rubber: produced by mixing it with $3\frac{3}{4}$ or less per cent of sulphur and subjecting it to a heat of 330° F. or over.

321,548—July 7, 1885. J. J. VARLEY. *Plastic composition.*

Articles made of a plastic composition—of the class containing resins, gums, etc.—are subjected to heat, gradually applied, whereby they are rendered tough, hard, and heat resisting.

322,802—July 21, 1885. A. G. DAY. *Process of making the compound termed "kerite."*

In the manufacture of kerite (see No. 210,411) in place of sulphur, sulphide of antimony, or other suitable sulphide is added, either alone or united with a greater or less proportion of sulphur, to enable the chemical heat to be controlled by the sulphide and to prevent oxidation of the finished product.

322,804—July 21, 1885. A. G. DAY. *Process of manufacturing crude kerite compounds.*

In the manufacture of kerite according to Nos. 210,411 or 322,802, a vegetable astringent—such as tannin or tannic acid, extract of gambia, extract of pine, spruce, or oak bark, extract of nut galls or sumac—is added either before or after, or with the sulphur or sulphide; it imparts a more fibrous character to the product.

327,286—September 29, 1885. S. LOEWENTHAL. *Manufacture of ornamental wall covering, leather cloth, etc.*

A mixture of 100 pounds of African flake, 10 pounds of rubber, 100 pounds of rubber substitute, 10 pounds of ozocerite, 100 pounds of infusoria, and 100 pounds of wood pulp or ground cork, with $2\frac{1}{2}$ per cent of sulphuric acid and 5 per cent of muriatic acid, is spread on a fabric printed with a pattern or design, with or without embossing, and dried.

335,495—February 2, 1886. J. B. WILLIAMS. *Composition of matter for insulating material.*

It consists of gutta-percha, india-rubber, colophony, gum dammar, and asphalt, all in solution, and anhydrous paraffin oil with or without powdered silica.

336,018—February 9, 1886. W. J. RIGNEY AND J. WOLFF. *Composition for insulating electric wires.*

An outer coating of balata, or of a mixture containing balata—obtained from the milky juice of the *Sapota muelleri*, and resembling india-rubber—is employed in connection with an inner coat of adhesive material, as tuna—a substance resembling gutta-percha—or tar.

337,466—March 9, 1886. R. P. WALLIS. *Flexible lead pencil.*

An elastic composition formed of graphite and caoutchouc.

339,787—April 13, 1886. E. D. KENDALL. *Composition of matter for electric insulation.*

A compound of wax tailings of petroleum refining, 32 parts; chicle, 16 to 32 parts; sulphur, 4 to 8 parts; and oil, 1 to 2 parts.

346,224—July 27, 1886. T. C. ROCHE. *Composition for holding photographic paper on its supports; etc.*

A mixture of rubber, pitch, and a solvent, as benzole; also a mixture of rubber, beeswax, and a solvent; the mixtures being combined or used alone.

343,591—June 15, 1886. O. LUGO. *Vulcanite and process of producing the same.*

A vulcanized mixture of hair or horny material, sulphur, and india rubber.

349,885—September 28, 1886. G. W. HOLLEY. *Manufacture of paint.*

A paint consisting of a given quantity of mineral oxides, earths, or other pigments, combined with from one-tenth to one-half its weight of pulverized sulphur and linseed oil: formed by mixing the sulphur with the pigments, then gradually adding with constant stirring about one-third of its weight of linseed oil previously heated to 80° C. and at the same time gradually raising the temperature to 120° or 125° C.; then cooling slowly under constant stirring, and lastly grinding.

350,459—October 5, 1886. A. KISSEL. *Substitute for india rubber, caoutchouc, etc.*

A compound of the hardened resin and balsams of the coniferae and oil and sulphur; formed by hardening the resin and balsams by means of caustic lime or other caustic alkaline earth; dissolving the hardened resin or balsam in oil; adding to the solution a second solution composed of sulphur and oil; adding sulphur to the mixed solutions; and heating the mass.

358,082—February 22, 1887. A. W. SPERRY. *Composition of matter as a substitute for hard rubber, etc.*

It is composed of ivory dust or like material, forming 50 per cent of the compound; a starch mixture consisting of starch, tannin, and an alkali, as alum; a binder mixture consisting of a resinous gum dissolved in alkali, as caustic soda, and milk, glue, shellac, and alcohol.

359,825—March 22, 1887. C. M THOMPSON. *Insulating material.*

A compound of dead-oil of pitch 1 part, and desulphurized old rubber, commonly known as "shoddy," 7 parts: pitch and desulphurized rubber are mixed with cold rollers, then steam is introduced and it is rolled into thin sheets and thoroughly dried.

359 907—March 22, 1887. C. M. THOMPSON. *Process of curing india rubber.*

A compound consisting of india rubber and lampblack, produced by subjecting india rubber to the action of hot rollers, adding from 5 to 20 per cent of lampblack, and then continuing the action of the rollers.

36 137—June 21, 1887. H. W. LIBBEY. *Rubber-covered elastic compound.*

I consists of particles of sponge and india rubber; rubber is reduced by heat and particles of sponge are distributed in the mass and mingled therewith.

368,174—August 9, 1887. H. VOGLEY. *Composition for cementing rubber.*

A composition formed by mixing and dissolving $2\frac{1}{4}$ ounces of pure rubber gum, 3 ounces of pulverized gum gamboge, and 11 ounces of dry white lead, in 1 gallon of benzine; and subsequently adding a mixture of 2 ounces of pulverized sulphur and $2\frac{1}{2}$ ounces of sulphuric ether, with or without one-half ounce of alum and one-fourth pound of burnt brown sugar.

375,405—December 27, 1887. F. WILHÖFT. *Method of manufacturing nonblooming vulcanized soft rubber.*

Rubber is mixed with a sulphur preparation in which this body is in a lastingly-amorphous condition by the addition of a greasy, fatty, resinous, or turpentine body, and vulcanized. The said sulphur preparation is formed by fusing 1 pound of sulphur, say, with one-fourth of a pound of Canada balsam.

375,436—December 27, 1867. S. M. ALLEN. *Recovering and utilizing waste rubber.*

Disintegrated rubber waste is treated in a mixture of nonvolatile oil, asphalt, resin, and sulphur, and heated until the mass is devulcanized, and the fiber converted into gelatine.

378,395—February 21, 1888. S. HEIMANN. *Process of treating peat.*

A vulcanized mixture of dry pulverized peat, caoutchouc and sulphur, with or without plaster of paris.

380,993—April 10, 1888. G. W. COOPER. *Compound oil dressing for rubber belts.*

To a mixture of 8 pounds of crude rubber, one-half gallon oil of turpentine, 1 pound oil of lemon-grass, 1 pound of citronelle, and 6 ounces gum arabic, there is added 8 gallons of light pressed fish oil, and cooked for eight hours; after cooling there is added the condensed product of 4 gallons of linseed oil boiled down to $2\frac{1}{2}$ gallons, and the composition is cooked for six hours.

383,098—May 22, 1888. D. BROOKS, JR. *Covering for electric wires and cables.*

Electric wires are first covered with a fibrous tape saturated with an insulating compound, then with a plastic rubber preparation with interlying canvas wrappings and powdered sulphur, and then subjected to heat to vulcanize the rubber.

383,137—May 22, 1888. W. B. McGARVEY. *Composition for converting india rubber or its compounds into hardened rubber.*

A mixture of oxide of iron and petroleum or rocky oil is incorporated with pure rubber or any of its compounds, and the mass fused and subjected to pressure.

391,927—October 30, 1888. J. A. TITZEL. *Rubber compound or mixture.*

Composed of gilsonite asphaltum, 90 pounds; vulcanized rubber (scrap or waste), 130 pounds; manganated linseed oil, $3\frac{1}{2}$ to 7 gallons; spirits of turpentine, 9 gallons; deodorized petroleum naphtha, 9 gallons; and powdered sulphur, 10 to 15 pounds; for use as a paint, baking-japan, or coating.

393,838—December 4, 1888. W. KIEL. *Vulcanized plastic compound.*

A vulcanized compound of pumice stone, india rubber, and sulphur, with or without oil or beeswax, the pumice stone being from one to five times the weight of the crude rubber.

395,987—January 8, 1889. N. C. MITCHELL. *Process of recovering rubber from waste.*

Rubber waste is immersed in a reclaiming solution containing for each 100 pounds of waste about 15 to 25 pounds of hydrochloric acid, or its specified substitute, in excess of the quantity requisite to combine with the decomposable mineral compounds, and heated in a close vessel under pressure to about 240° F.

396,774—January 29, 1889. A. SOMMER. *Paint-oil.*

A solution in hydrocarbons of the sulpho-chlorinated marine-animal oils.

401,269—April 9, 1889. F. GREENING. *Process of production of material as substitute for india-rubber, etc.*

Fibrous material is steeped or saturated with a mixture of sulphuric acid and nitrate of potash—3 parts of the former to 2 parts of the latter by weight—washed, and then subjected to a bath of liquid carbonic acid or carbonic-acid gas and dried. The converted fiber is then treated with a suitable solvent, as a distillate composed of a mixture of methylated alcohol, resin, or colophony, gum benzoin or benjamin, castor oil, and light hydrocarbon.

411,171—September 17, 1889. C. A. A. H. SIEBERT. *Substitute for gutta-percha.*

A mixture of 1 part of asphaltum, one-fourth to 1 part of balsam of sulphur, and up to one-half part of an easily-melting solid hydrocarbon, such as paraffin.

412,264—October 8, 1889. W. KIEL. *Vulcanized plastic compound.*

Wood is used as a constituent part of a vulcanizable compound.

412,265—October 8, 1889. W. KIEL. *Process of manufacturing vulcanized plastic compound.*

Wood is soaken in oil and subsequently combined by vulcanizing with sulphur and crude rubber.

412,266—October 8, 1889. W. KIEL. *Process of manufacturing vulcanized plastic compounds.*

Wood and sulphur are vulcanized and the product commingled with sulphur and crude rubber and vulcanized.

412,267—October 8, 1889. W. KIEL. *Process of manufacturing vulcanized plastic compounds.*

Wood is mixed with crude rubber dissolved by any solvent, and the product combined with sulphur oil, and beeswax, with or without crude rubber, and vulcanized.

412,268—October 8, 1889. W. KIEL. *Process of manufacturing vulcanized plastic compounds.*

A mixture of wood, sulphur, oil, and crude rubber is vulcanized to a hard state, the product pulverized and combined with sulphur, oil, and crude rubber, ready for vulcanization.

412,269—October 8, 1889. W. KIEL. *Process of manufacturing vulcanized plastic compounds.*

A mixture of wood, sulphur, and oil, or other commingling vulcanizable substance, is vulcanized and the product subsequently combined with crude rubber by vulcanization.

418,044—December 24, 1889. N. C. MITCHELL. *Art of restoring rubber.*

Rubber stock is subjected to the action of live steam in a close vessel; air is drawn through the mass to remove surplus moisture, and finally the rubber is rolled while in a moist condition, until dry.

418,208—December 31, 1889. A. E. MEUNUEZ. *Insulating and waterproofing composition.*

A composition consisting of shoemaker's wax, gutta-percha with or without india-rubber, a suitable solvent, such as chloroform, bisulphuret of carbon, and japan; to which may be added a hardening wax, such as beeswax or paraffin wax.

419,697—January 21, 1890. N. C. MITCHELL. *Process of reclaiming rubber from waste rubber goods.*

First, the stock is ground; second, particles of iron are eliminated by magnetic attraction; third, the fiber is separated from the rubber; fourth, it is washed with water to remove soluble matter; fifth, it is sifted to separate raw sand and other fine particles; sixth, the mass is acted on with a stream of water to float off the rubber from the heavier foreign substances; and finally, it is devulcanized and sheeted.

420,648—February 4, 1890. J. B. WILLIAMS. *Insulating compound.*

A compound of india-rubber, say 40 parts; paraffine, preferably that obtained from ozocerite or mineral wax, 15 parts; a resinous body, as shellac, 40 parts; and sulphur, 5 parts; with or without silica or bituminous matter, produced by dissolving the india-rubber in a volatile solvent, dissolving the paraffine in the india-rubber solution, distilling therefrom the volatile solvent, and then incorporating therewith the remaining ingredients.

420,820—February 4, 1890. N. C. MITCHELL. *Process of restoring rubber.*

Rubber, after reduction to small pieces, is mixed with heavy oil and sulphide of calcium, then subjected to the action of steam until devulcanization is completed, when air is drawn through the mass before its removal from the devulcanizer.

423,071—March 11, 1890. N. C. MITCHELL. *Production of restored or devulcanized rubber.*

The rubber is devulcanized by the action of live steam, then while the rubber is yet moist it is rolled until reduced to a powder, and then dried, at the same time agitating it to preserve the powdery condition.

428,544—May 20, 1890. E. ANDREWS. *Composition of matter for use in the mechanic arts.*

Finely ground or comminuted leatheroid or parchmentized paper mixed with rubber in proportions varying from 40 to 90 per cent of the former to 60 to 10 per cent of the latter, and vulcanized.

430,958—June 24, 1890. W. KIEL. *Vulcanized plastic compound.*

A hard vulcanized plastic compound, consisting of crude rubber, sulphur, and mineral oil, as kerosene; the sulphur being in proportion of not less than approximately 80 per cent of the rubber by weight.

430,959—June 24, 1890. W. KIEL. *Process of manufacturing vulcanized plastic compounds.*

A mixture of sulphur and rubber, with or without oil—the sulphur being in the proportion of not less than about 80 per cent of the rubber by weight—is vulcanized with an initial temperature of not less than about 300° F. and for stated periods of time.

431,104—July 1, 1890. J. H. CHEEVER. *Protective covering for electric cables.*

A compound of 11 parts of rubber, 9 parts of plumbago, 9 parts of asbestos, and 2 parts of sulphur; it is vulcanized after application to a conductor.

433,893—August 5, 1890. J. FOTTRELL. *Insulating material.*

A mixture of india-rubber and aluminium oleate, say in equal parts by weight. It is susceptible of vulcanization.

438,313—October 14, 1890. O. A. ENHOLM. *Composition for cells or retaining vessels.*

A composition of asbestos, mineral wax, and gutta-percha (No. 438,311 with the omission of the hardening medium, shellac).

438,595—October 14, 1890. W. H. ALLEN AND C. LOVELL. *Rubber compound.*

A plastic compound composed of rubber, sulphur, and lithargite (pulverized calcined magnesic silicate).

452,439—May 19, 1891. R. A. LOEWENTHAL. *Production of reclaimed rubber.*

The fiber is decomposed and eliminated from the rubber waste, which is then partially dried and reduced to a fine powder before devulcanization.

452,760—May 19, 1891. F. SALATHÉ. *Composition of matter for insulating purposes.*

A composition consisting of the hydrocarbon product of No. 452,764, with sulphur, with or without the addition of india-rubber, gutta-percha, or oxidized linseed oil. It is subjected to a heat of from 121° to 162° C.

452,765—May 19, 1891. F. SALATHÉ. *Composition of matter for insulating purposes.*

A composition of gutta-percha, gum shellac, and a new hydrocarbon product, a resinoid hydrocarbon of the $C_{10}H_{16}$ series.

454,442—June 16, 1891. N. C. MITCHELL. *Production of waste rubber goods.*

The devulcanized rubber is impregnated with moisture and kept wet during the rolling or pressing process.

454,489—June 23, 1891. G. W. MELVILLE. *Composition of matter.*

A vulcanized mixture of fine Para rubber, 60 per centum; flowers of sulphur, 6 per centum; oxide of antimony, 14 per centum; and magnesia, 20 per centum. It will resist a high heat, and withstand the action of salt-water, grease, or oil.

454,548—June 23, 1891. A. W. SPERRY. *Compound for the manufacture of insulators, packings, etc.*

A compound of 8 pounds of mineral wool, $1\frac{1}{4}$ pounds of rubber and linseed oil combined, and 3 pounds of oxide of zinc.

458,551—August 25, 1891. J. L. MARMAUD. *Insulating compound.*

To a mixture of 1 part of calcined lixiviated infusorial earth, a third of 1 part of pulverized talc or soapstone, one thirty-second part each of lampblack, pulverized sulphur and litharge, one-sixteenth part of pulverized resin, and one sixty-fourth part of silicate of soda in solution, there is added 22 parts of rubber dissolved in benzine or naphtha, one-fifth part of bisulphide of carbon, and one-fifth part of fir balsam.

460,765—October 6, 1891. E. THOMSON. *Composition for insulating material.*

A mixture of asbestos, rubber, and soapstone, say 15 to 25 per cent of rubber and 5 to 15 per cent of soapstone, molded in a heated state with great pressure.

467,520—January 26, 1892. D. H. PIFFARD. *Composition of matter for insulating purposes.*

A mixture of 5 parts of rubber, 24 parts of resin, and 26 parts of plaster of paris; the rubber and resin are first mixed and heated until the readily volatilizable parts are driven off.

468,627—February 9, 1892. A. I. RATH. *Manufacture of india rubber.*

A composition consisting of india rubber mixed with finely-reduced silk fiber.

490,500—January 24, 1893. J. M. RAYMOND. *Process of treating vulcanized rubber to render it adhesive.*

Vulcanized rubber first soaked in benzine or a substance having an analagous action to open the pores, then immersed in a solution of potassium permanganate to secure superficial desulphurization, and again treated with benzine. In certain cases, to give tenacity, before the last-named operation, it may be given a bath of acetic acid or pyroligenous acid.

495,757—April 18, 1893. D. RIGOLE. *Process of and apparatus for the extraction of gutta-percha from the leaves and twigs of the gutta-percha tree.*

The condensed vapors of a solvent are passed through a mass of the leaves and twigs, thereby dissolving the gum; the solvent with gum in solution is conveyed away, and heated to vaporize the solvent and the vapors condensed for reuse.

508,560—November 14, 1893. P. C. BEIERSDORF. *Process of treating gutta-percha or balata.*

To obtain gutta-percha or balata of uniform qualities, a certain quantity is deprived of the whole of its resinous contents by subjecting it to the action of a solvent of said contents, and then there is mixed with the so-deprived quantity a proper quantity of gutta-percha or balata, which is richer in resinous matter than the quality desired.

510,888—December 19, 1893. J. BURBRIDGE. *Process of producing variegated rubber.*

Variegated sheets are formed by twisting strips of consolidated layers of different colored compounds, making up the twisted strips into rings or cylinders, and cutting shavings or sheets before or after vulcanization.

518,046—April 10, 1894. J. M. RAYMOND. *Composition of matter for vulcanizing rubber.*

It consists of benzene, or its derivatives, 30 to 50 parts in weight; camphor, 2 to 5 parts; and chloride of sulphur, 1 to 2 parts; with or without oleic acid, 1 to 2 parts.

518,817—April 24, 1894. R. HUTCHISON. *Gutta-percha or rubber compound.*

A composition consisting of gutta-percha or rubber or mixtures thereof and wool cholesterine.

520,196—May 22, 1894. J. THOMSON. *Method of manufacturing hard rubber articles.*

The crude compound is subjected to combined heat and pressure in a mold until the plastic compound assumes the form of the mold cavity, when the pressure is wholly or partially removed, allowing the material to expand while subjected to heat but not pressure, and then cooling under these conditions.

522,312—July 3, 1894. A. A. BLANDY. *Process of and composition for manufacturing substitutes for india rubber, etc.*

A composition consisting of a drying oil, as linseed oil, a solvent for the same, such as carbon bisulphide, sulphur chloride, asphalt, rubber, and sulphur, with or without a metallic oxide, such as lime. It is formed by mixing together the drying oil, solvent, and sulphur chloride, gently heating the mixture, then adding the asphalt and heating the product, and then incorporating rubber and sulphur, and finally vulcanizing.

525,086—August 28, 1894. J. PATTIGLER. *Elastic or plastic composition.*

A composition consisting of vegetable or mineral oil, caoutchouc, zinc white, soluble glass, minium, and asbestos.

528,264—October 30, 1894. H. TRAUN. *Process of vulcanizing hard rubber articles.*

Pulverized metallic aluminum, or an alloy of aluminum, with tin, cadmium, or nickel, is added to the soft rubber before vulcanization. It increases the heat-conducting power of the rubber and secures uniform vulcanization.

529,730—November 27, 1894. W. GRISCOM, JR. *Hard, vulcanized compound.*

It is composed of candle tar as a vulcanizable adhesive element, sulphur, petroleum residuum, and finely divided solid matter.

538,147—April 23, 1895. C. BARUS. *Process of manufacturing vulcanized rubber.*

Rubber, at any stage of vulcanization, is impregnated with carbon disulphide (with or without sulphur) and the mass subjected to the action of heat (which never exceeds 200° C.) in a hermetically closed vessel until it is melted down to a homogeneous mass.

544,934—August 20, 1895. H. E. SÉRULLAS. *Process of extracting and purifying gutta-percha.*

The parts of the tree are treated with an alkali or its carbonates; the residue then treated with dilute sulphuric acid; next the residue is spread out into sheets, and the sheets treated first with a stream of ammoniacol copper liquid, and afterwards with a current of carbonic-acid gas or hydrogen gas.

547,120—October 1, 1895. S. HEIMANN. *Insulating compound.*

To a mixture of equal quantities of pulverized asbestos and glass there is added 10 to 15 per cent of rubber (the mixture rolled into sheets and dissolved in benzine), 5 per cent of castor oil and 20 per cent each of resin oil and mirbane oil, and then 10 to 15 per cent of celluloid dissolved in amyloxide-acetic. In coating a wire it is first given a coat of a mixture of water glass and pulverized glass.

549,855—November 12, 1895. R. N. PRATT AND H. W. JOHNS. *Composition of matter for compressed or molded articles.*

It consists of asbestos and rubber, or other cementing insulating substance, and an insulating natural lubricant, as soapstone.

551,230—December 10, 1895. R. N. PRATT. *Composition of matter for insulating purposes.*

A composition consisting of dense hard rubber, laminated mica, and fibrous asbestos, produced by dissolving rubber and sulphur in naphtha, incorporating therewith mica and asbestos fibers, molding and vulcanizing.

563,379—July 7, 1896. C. W. JEFFERSON. *Flexible mica insulating sheet.*

The sheet consists of layers of mica scales and adhesive gutta-percha tissue, with or without fibrous layers, as of paper.

563,716—July 7, 1896. C. W. JEFFERSON. *Electrical insulating sheet.*

A sheet formed of layers of asbestos and mica, or paper, asbestos, mica and paper, with adhesive gutta-percha tissue between any and every two of said layers.

575,739—January 26, 1897. H. E. SÉRULLAS AND F. E. HOURANT. *Process of extracting and purifyiug gutta-percha.*

The leaves or other parts of gutta-percha plants are pulverized, the powder dissolved in a hydrocarbon solvent, and the three principal constituents of gutta-percha, viz—gutta-hydrocarbon, fluavil, and alban—then precipitated by the addition of acetone.

580,139—April 6, 1897. W. MORISON. *Composition of matter for manufacturing battery cases, etc.*

A composition of asphaltum with or without a small quantity of gutta-percha, as much asbestos as can be absorbed, and a little sulphur; compounded by melting the asphaltum and adding the gutta-percha, then intimately mixing therewith the asbestos, spreading out the mass on a hot surface and working, heating, and pounding, to drive out moisture and foreign substances; dusting with sulphur and again heating, pounding, and working; the mass being kept hot throughout the process; and finally forming into shape.

581,319—April 27, 1897. P. W. WIERDSMA AND J. KUIPERS. *Substitute for vulcanite, hard woods, etc., and process of manfacturing same.*

The refuse remaining after the manufacture of potato flour is mixed with water, passed through a sieve, washed, bleached, and dried, with or without the addition of waterproofing material, ground into a powder, sifted, and molded dry by great pressure.

584,959—June 22, 1897. C. V. PETRALUS. *Rubber compound.*

A rubber compound having in admixture with caoutchouc and sulphur, finely-powdered native lead sulphide or galena, with or without lead oxide.

598,550—February 8, 1898. B. G. WORK. *Process of treating rubber.*

For the manipulation of raw vulcanizable india rubber in the formation of covered articles in hollow shapes, tubes, etc., the rubber is given a condition of temporary inherent abnormal rigidity by freezing it.

599,694—March 1, 1898. F. FENTON. *Process of producing artificial gutta-percha.*

Tar or other pyroligneous substance is mixed with an oxidizable vegetable oil either in the raw state or more or less oxidized, and the product placed in a bath of diluted nitric acid to form a magma or base, which is then roasted.

601,091—March 22, 1898. P. L. CLARK. *Process of devulcanizing rubber.*

It is saturated with a solvent of rubber and sulphur adapted to vaporize at a temperature below the melting or disorganizing point of rubber (such as gasoline) and maintained in such saturated condition by the pressure of vapor of such solvent while heating it in such vapor, to a temperature adequate to maintain the pressure therein, but lower than the melting or disorganizing point of rubber, until devulcanization is effected.

601,828—April 5, 1898. O. B. DODGE. *Leather and rubber substitute.*

A compact sheet consisting of chemical wood fibers uniformly mixed with and enveloped in a firmly adherent mass of cured rubber and pulverized material; produced by drying chemical wood pulp, separating the fibers into a flocculent mass; mixing the flocculent mass with a mass of rubber cement and a pulverized material, as chalk, lampblack, and sulphur; forming into shape; and subjecting to a degree of heat which is less than that usually employed for vulcanization, preferably about 95° to 105° C.

615,863—December 13, 1898. W. K. LEONARD. *Process of producing rubber substitutes and compositions of matter therefor.*

A composition consisting of 76 per cent of corn oil, 21 per cent of sulphur, and 3 per cent of paraffin wax, formed by subjecting the mass to heat until the oil is vulcanized or the process of vulcanization begins, about 310° F., then shutting off the heat and allowing the process of vulcanization to continue until complete and the mass cools.

615,864—December 13, 1898. W. L. LEONARD. *Process of producing rubber substitutes and compositions of matter therefor.*

A rubber substitute consisting of a mixture of corn oil, say 64 per cent, and castor oil, 13 per cent, combined with a mixture of chloride of sulphur, naphtha, and oxide of magnesia, say in relation to the entire mass of 21 per cent of chloride of sulphur, 0.5 per cent of naphtha, and 1.5 per cent of oxide of magnesia; percentages by weight.

618,166—January 24, 1899. T. CLARKE. *Composition of matter for producing enamel for refixing dental plates of artificial teeth.*

It consists of $1\frac{1}{2}$ parts of dental rubber dissolved in machine oil and scented with attar of roses; 5 parts of yellow gum shellac; 3 parts of plaster of paris colored with carmine; and one-twentieth part of pure Condy's fluid.

619,615—February 14, 1899. C. RATH. *Composition of matter.*

It consists of 76 parts of pure india rubber, 17 parts of bran of almonds, and 7 parts of calcined chalk, combined by kneading while the rubber is in a soft, plastic state; for rubber implements for therapeutic treatment, it combines hardness with elasticity, has a smooth, glossy surface, is moderately porous, and readily absorbs a lubricant.

621,060—March 14, 1899. E. GARNIER. *Manufacture of rubber or other gums.*

Alum treated with a spiritous solution of a gum, as a solution of gum tragacanth in benzol, is incorporated with rubber and the usual vulcanization dispensed with.

626,092—May 30, 1899. J. C. PETMECKY. *Rubber compound.*

A viscous compound, for repairing pneumatic tires, etc., consisting of a mixture of pure rubber dissolved in a quick-drying solvent, as bisulphide of carbon, ground and slightly vulcanized rubber, and cotton fiber cut to one-eighth to one-sixteenth of an inch in length.

626,479—June 6, 1899. P. C. BELL. *Elastic compound.*

A compound of vegetable oil, 59 parts; flower of sulphur, 15 parts; liquid tar, 1 part; petroleum residue, 20 parts; and powdered talc, 5 parts. The petroleum residue is heated to 112° F., the powdered talc and tar is mixed therewith, and the vegetable oil then gradually added while maintaining the said temperature, next raising the temperature to 200° F. and adding the flower of sulphur, and finally raising the temperature to 340° F. and stirring until viscid.

627,689—June 27, 1899. C. HEINZERLING. *Treatment of old or waste vulcanized rubber.*

Waste rubber is dissolved by the action of anilin, toluidin, or xylidin, and the solvent separated from the india rubber.

630,435—August 8, 1899. M. ZINGLER. *Composition for treating decayed or other rubber.*

A solution for treating decayed or other rubber by long immersion, consisting of 30 or 40 gallons of boiling water containing about 5 pounds of tartar emetic, mixed afterwards with 7½ pounds of tannic acid and about 2½ pounds of a metallic sulphite salt such as calcium sulphite.

632,022—August 29, 1899. C. RÉPIN. *Process of treating india rubber, gutta-percha, etc.*

It consists in raising wood oil (expressed out of seeds of *elaeococea vernicifera*), with which may be mixed a cheaper oil having greater density and lighter color, to a suitable heat, as 250° C., whereby the same will be coagulated; pulverizing the solidified oil and mixing with india rubber and the like.

635,141—October 17, 1899. A. H. MARKS. *Process of reclaiming rubber from vulcanized rubber waste.*

Finely ground rubber waste is submerged in a dilute alkaline solution in a sealed vessel and subjected to a temperature of 344° to 370° F. for about twenty hours

637,776—November 28, 1899. A. GENTZSCH. *Plastic felt.*

An intimate conglomeration of gutta-percha with shredded or macerated animal skins and hair.

638,775—December 12, 1899. A. E. J. V. J. THEILGAARD. *Process of devulcanizing caoutchouc, india rubber, etc.*

The comminuted vulcanized material is treated with a solution of sodium sulphite—the amount being in proportion to the contained sulphur—under the influence of heat, and then washed.

639,926—December 26, 1899. O. LUGO. *Rubber substitute or artificial rubber.*

It consists of sulphurized oil practically free from glycerine compounds. Seventy-five per cent of the substitute may be mixed with rubber.

639,927—December 26, 1899. O. LUGO. *Manufacture of rubber substitutes.*

Process consists in subjecting sulphurized oil to hydrosaponification until it becomes liquid, then dehydrating the liquid vulcanite, adding sulphur, and then heating the mass.

640,735—January 9, 1900. P. C. BELL. *White elastic compound.*

It consists of vegetable oil, 65 parts; chloride of sulphur, 20 parts; mineral matter, such as lime, 5 parts; and zinc oxide, 5 parts; and bisulphide of carbon, 5 parts. The vegetable oil is heated to 80° F., the chloride of sulphur and bisulphide of carbon added at 60° F., the mass stirred until it foams and kept in agitation until the maximum bulk is reached, then the mass is broken, the mineral matter added, whereupon it hardens, when the product is pulverized and bleached.

642,764—February 6, 1900. A. E. J. V. J. THEILGAARD. *Process of devulcanizing caoutchouc, india rubber, etc.*

The comminuted vulcanized rubber is treated with a cyanide solution (potassium cyanide) in proportion to the amount of contained sulphur, the temperature being eventually raised; the material is then washed and dried.

642,814—February 6, 1900. R. COWEN. *Process of cleaning rubber.*

Rubber is reduced to a plastic condition by heating, and then strained under pressure to remove foreign materials.

645,331—March 13, 1900. W. PRAMPOLINI. *Composition of matter.*

As a substitute for india rubber, the gummy matter of the shrub *Synantheroeas Mexicanos* (known also by the Indian names of "Tule," "Copalin," "Terba del Negro," "Guayle," "Jiguhite," and "Hule"), combined with the residual oil of a volatile hydrocarbon solvent.

647,112—April 10, 1900. J. J. PEARSON. *Composition of cork and rubber for boot-heels, etc.*

An intimate mixture of cork and rubber, the cork being held under great compression in the rubber.

651,640—June 12, 1900. H. L. RUSSEGUE. *Elastic waterproof composition.*

A composition of balata and vegetable fiber—a sheet of balata is united with dry vegetable fiber by pressure.

651,582—June 12, 1900. H. SCHNEIDER. *Substitute for gutta-percha.*

A composition formed of 45 per cent of asphalt tar, 40 per cent of resin, 10 per cent of spirits of turpentine, and 5 per cent of linseed oil.

651,753—June 12, 1900. B. C. FOWLKES. *Dental compound.*

The compound comprises a solvent, vehicle, and drying constituents, as carbon bisulphide, 2 ounces; benzin, 1 dram; and chloroform, 1 dram; with black dental rubber, one-eighth of an ounce; and powdered aluminum, 1¼ ounces.

CASEIN PLASTICS.

86,710—February 9, 1869. J. & W. THIEM. *Improved composition for moldings.*

A mixture of sawdust, 4 pints; milk curd, 1 pint; slaked lime, one-third of a pint; and cotton, 1 ounce, more or less.

153,939—August 11, 1874. J. FRAUENBERGER. *Improvement in artificial ivory, corals, etc.*

A composition made of casein 2 parts, heated in a closed vessel on a water bath and then boiled under suitable heat with 1 part of a varnish-like solution of copal in concentrated liquid ammonia and alcohol.

169,053—October 19, 1875. J. G. W. STEFFENS. *Improvement in compositions for ornaments.*

A composition of curd, alkali, and resinous matter; fixed by steeping in whey or milk before pressing, and in cold water containing oil of vitriol after pressure.

182,431—September 19, 1876. J. FRAUENBERGER. *Improvement in compositions and processes for making artificial coral, ivory, etc.*

Casein is mixed with sal soda and water and dissolved under the action of heat; the oily matter is removed; and after cooling and coloring, acetic acid is added, and the resulting pasty, gummy mass is freed from moisture by pressure and evaporation.

307,179—October 28, 1884. E. E. CHILDS. *Preparation of casein and of articles made therefrom.*

Casein prepared from milk curd or cheese is worked or kneaded in water at or near the boiling point until it reaches a tough and glutinous consistency.

307,269—October 28, 1884. E. E. CHILDS. *Preparation of casein and of articles made therefrom.*

Casein is prepared from milk curd, having washed or eliminated from it fatty and other objectionable matters, by working or kneading the curd in its naturally saturated condition, sufficient water of saturation being retained to admit of the working, at a temperature below the boiling point of water, until it reaches a tough and glutinous consistency.

353,697—December 7, 1886. L. R. MESTANIZ. *Making artificial bone, ebony, marble, etc.*

Skim milk is treated with salt, caustic soda, terra alba, hydrochloric, nitric, and sulphuric acids, and coloring matter, or with an alum solution and glycerine in lieu of a mixture of hydrochloric and nitric acids. Pot cheese may be used as the base, with borax in place of caustic soda.

610,626—September 13, 1898. P. H. HENSEN. *Composition containing casein for electric insulating or other purposes.*

A composition consisting mainly of casein, india rubber, and asphalt, subjected to pressure in a hot mold.

632,408—September 5, 1899. W. A. HALL. *Process of producing casein.*

See Group XVIII, Fine Chemicals, Proteids.

646,844—April 3, 1900. W. KRISCHE AND A. SPITTELER. *Process of manufacturing water-resisting products from casein.*

Soluble casein is rendered insoluble by the action of acids or salts, as by dissolving casein in water containing 5 per cent of sodium carbonate and coagulating by gradually adding a weak solution of lead acetate, and is then treated with formaldehyde, either while wet or after it has been dried.

649,690—May 15, 1900. W. A. HALL. *Solid casein.*

Solid homogeneous casein produced by hydrating the casein by grinding and thoroughly agitating the same in water so that the water is beaten into every cell thereof, thus forming a thin pulp, and then draining and drying the product and permitting the same to shrink together.

662,444—November 27, 1900. C. JUNG. *Insulating composition.*

A mixture, say, of equal parts of crude caoutchouc and casein, with a minor quantity of a resin, is vulcanized.

OTHER PLASTICS.

3,598—May 25, 1844. E. DEUTSCH. *Improvement in waterproof cements, etc.*

Bitumen, asphaltum, and like material is distilled, the residuum cooled and used as a base to mix with various ingredients as protoxide of lead, siccative oil, resin, wax, sulphur, etc., to form different coating and protecting products.

4,362—January 23, 1846. C. BRANWHITE. *Improvement in compositions for making handles, molds, etc.*

Half a pound of starch in one pint of cold water is added to one quart of boiling water and well mixed, then allowed to cool, when finely sifted dry mahogany sawdust (or wood ashes or whitening) is mixed therewith to form a dough.

17,949—August 4, 1857. W. M. WELLING. *Improvement in factitious ivory.*

A mixture of shellac, ivory dust, and camphor, with pigments, as impalpable white, vermilion, etc., according to the color, mixed and heated, preferably by steam under pressure, to 115° to 138° C.

19,778—March 30, 1858. J. BURROWS HYDE. *Improvement in compositions for coating telegraph wires.*

A composition formed by mixing 1 part of boiled linseed, cotton seed, or resin oil with 8 parts of asphaltum, the latter to be melted and the oil gradually stirred in.

45,518—December 20, 1864. I. N. PEIRCE. *Improved composition for crayons.*

A compound, using kaolin as the base, as kaolin 48 parts, calcined plaster of paris 16 parts, white glue 1 part, and water.

50,658—October 24, 1865. H. J. GRISWOLD. *Improved transparent composition for tablets.*

A coating formed of 5 pounds of chemically prepared soapstone incorporated with 18 pounds of white shellac varnish is applied to a card or other foundation.

51,009—November 21, 1865. R. BORCHERDT AND H. BERGMAN. *Improved composition for the manufacture of toys.*

A mixture of glue, 5 pounds; sugar or honey, 10 pounds; glycerine, 2½ pounds, and Perry's white, 3 pounds.

60,984—January 1, 1867. H. WURTZ. *Improved composition of glue or gelatine, and other materials, called durogel.*

A combination of bichromate of potash with glue or gelatine, as solutions of 250 parts of glue with 5 parts of bichromate of potash, heated together.

63,087—March 19, 1867. A. PELLETIER. *Improved composition for coating wood, cloth, metals, and for forming various articles.*

The compound consists of vegetable fiber, soapstone, silicate of soda, red lead, and litharge. It is made impervious to water when coated by treatment with diluted muriatic acid, 1 part acid and 3 parts water.

71,210—November 19, 1867. A. PELLETIER. *Improved composition for coating wood, iron, paper, etc.*

A mixture of vegetable fiber pulp, silicate of soda, and soapstone, in about equal proportions by weight, made into sheets or used as a coating; it may be given a coat of coal tar and covered with powdered steatite.

71,893, December 10, 1867. R. O. LOWREY. *Improvement in composition of matter for the manufacture of waterproof paper and other articles.*

A new compound, produced by treating vegetable fiber or pulp, or article made therefrom, first, with solution of gelatine or animal glue, soap, and glycerine or saccharine water, and then with a suitable astringent solution which will render it insoluble in water, as of alum and salt in about equal proportions.

72,727—December 31, 1867. A. B. ELY. (*Reissue: 2,969—June 9, 1868.*) *Improvement in heel stiffeners.*

Fiber and resin are mixed and rolled, pressed or molded into form, or felted and woven fabrics are saturated with gums or analogous substances, and heated and pressed in molds.

76,773—April 14, 1868. H. W. JOHNS. *Improved compound for roofing and other purposes.*

The combination of asbestos with pigments, oleaginous or resinous matters or varnishes, or spirits, or ground or powdered minerals, or rubber.

77,938—May 12, 1868. W. M. WELLING. (*Reissue: 5,940—June 30, 1874.*) *Improvement in artificial ivory.*

A mixture of shellac 16 parts, camphor 1 part, and talc 16 parts, all by weight; mixed, heated, ground and molded while in a heated state.

77,991—May 19, 1868. R. O. LOWREY. *Improved plastic compound for roofing and other purposes.*

Vegetable fiber, with or without the addition of sand, clay, or similar substances, is mixed with silicate of soda, and after rolling, pressing, or molding, the article is treated with a solution of chloride of calcium: it may be saturated therewith, and, when hard enough to handle, treated in a hot solution.

79,794—July 7, 1868. S. WHITMARSH. *Improved composition for forming moulded and coated articles.*

A composition of blood with asbestos or other mineral or earthy matter, mixed or ground together and exposed to a temperature of 176° C. to give it a hard and waterproof character.

85,018—December 15, 1868. J. M. MERRICK, JR. *Improved material for the manufacture of boxes, picture frames, buttons, insulators, inkstands, and other articles.*

Powder of silica chemically prepared or in the form of diatomaceous deposits or infusorial earth is mixed with gum shellac or other gums.

85,055—December 22, 1866. C. E. BONNET. *Improved composition for ornamental mouldings.*

One-fourth of a pound of paper pulp is added to a solution of 2 pounds of glue in 5 pints of water, then a mixture of zinc white or white lead and 1 gill of linseed oil, and then sufficient whiting to form a tough dough.

88,516—March 30, 1869. R. W. RUSSELL. *Improved fibrous composition, slab and panel for roofs, floors, walls, tanks, and for other purposes.*

Disintegrated cane fiber is charged with or mixed with bitumen and formed into slabs, sheets, etc.

89,100—April 20, 1869, W. M. WELLING. *Improved elastic composition to imitate ivory and similar materials.*

An elastic compound is formed by a mixture of 1 pound of shellac, and, say, 3 ounces of india rubber; with this base there may be mixed gum-camphor, kaoline, ivory dust, bone dust, or dust of holly, satin, or other woods.

89,531 April 27, 1869. W. M. WELLING. *Improved composition for artificial ivory.*

A mixture of kaolin, 2 parts, and shellac, 1 part, with or without a small portion of gumcamphor. The mixture is passed through heated rolls and molded while warm.

91,090—June 8, 1869. W. COMPTON. *Improved composition-crayon.*

A mixture of about 6 pounds paris white, $3\frac{3}{8}$ ounces starch, 3 ounces of soap, and from one-half to $2\frac{1}{4}$ ounces of gum or glue.

92,303—July 6, 1869. G. F. GOETZE. *Improved papier-maché compound.*

A mixture of paper pulp 5 parts, glue 5 parts, turpentine 2 parts, oil 2 parts, flour 4 parts, and whiting to suit; forming a petrified compound.

99,355—February 1, 1870. G. SCHLUETER. *Improvement in compositions for molding from plaster of paris.*

Dry pulverized gum is mixed with dry plaster and coloring matter, after which water is added.

101,101—March 22, 1870. J. R. COLE. *Improved composition for the manufacture of tobacco pipes, stems, and cigar holders.*

Paper pulp is mixed with a solution of alum or other salts that will render it incombustible, and molded.

121,152—November 21, 1871. M. W. BROWN. *Improvement in composition stoppers for vessels.*

A mixture of 30 parts of glycerine and 40 parts of gelatine, with or without 4 parts of an alkaline solution of 10° Baumé.

122,962—January 23, 1872. C. H. POND. *Improvement in insulating compounds for telegraphs, etc.*

A mixture of coal tar, 1 part, and charcoal, or sawdust, tanbark, or other organic body having fiber or structure, 2 parts. The woody matter may be baked or thoroughly kiln dried.

124,201—March 5, 1872. M. G. FARMER. *Improvement in compounds for insulating telegraph wires, etc.*

A mixture of resin, 24 parts; beeswax, 16 parts; spermaceti, 8 parts; and oil, 1 part; for saturating porous insulators.

129,217—July 16, 1872. A. K. EATON. *Improvement in compounds of gelatine, tannin, and cellulose.*

A compound resulting from the chemical union of cellulose, tannin, and gelatine; say, glue, 54 parts; tannin, 46 parts, in the form of catechu or any of the crude tannin gums, and cellulose, 150 parts.

142,595—September 9, 1873. A. THIELE. *Improvement in composition mastic.*

A mixture of 40 parts of sand, 100 parts of chalk, 15 parts of tallow, and 6 parts of tar.

144,548—November 11, 1873. J. L. KENDALL. *Improvement in paper products.*

Paper pulp and sponge is saturated with linseed oil and subjected to pressure.

148,829—March 24, 1874. I. I. JACKSON. *Improvement in compositions for printers' inking rollers.*

A mixture of glue, 16 pounds, glycerine, 16 pounds; borax, 1 pound; and japan, 1 pound.

148,910—March 24, 1874. A. WILKINSON. *Improvement in compositions for coating telegraph wires.*

A mixture in, say, the proportions of white lead, 1 pound; japan, 1 ounce; pitch, 4 ounces; shellac, 3 ounces; tallow, 1 ounce; naphtha, 1 ounce; and linseed oil, 1 ounce.

149,615—April 14, 1874. D. G. AND S. STAIGHT. *Improvement in artificial ivory for piano keys and other articles.*

Alabaster, gypsum, or other variety of sulphate of lime is treated with heat and subsequent immersion in white hard varnish, olive oil, or other oleaginous, fatty, or waxy matter, and then repeatedly immersed in heated water or alum water; the hardness being varied by the use of the alum.

149,749—April 14, 1874. J. G. HALEY. *Improvement in compounds for a waterproof material.*

A compound made of limesoap, prepared of hydraulic cement and linseed oil, mixed with sulphate of zinc, bisulphuret of carbon, alum, asbestos, and clay.

150,194—April 28, 1874. A. SCHMIDT. *Improvement in composition moldings.*

A composition of ground tanbark, ground eggshells, and slacked lime, with an admixture of glue and linseed oil, is molded under a steam-heated dye with a sheet of veneer for the face of the molding.

168,086—September 28, 1875. F. B. DUFFEY. *Improvement in plastic compounds for making ornamental articles.*

A mixture of Spanish whiting, 3 pounds; white lead ground in oil, 1 pound; coach varnish, 6 drams; dammar varnish, 6 drams; Japan drier, 3 drams, and boiled linseed oil, 10 ounces.

174,527—March 7, 1876. F. HICKMAN. *Improvement in materials for chair seats, backs, veneers, floorings, etc.*

Sawdust or fine shavings, saturated with dissolved glue or melted shellac, is spread upon a backing of cloth or other material, and rolled or pressed before it is completely dry.

189,339—April 10, 1877. B. J. CLARKE. *Improvement in crayons for marking on glass, etc.*

A mixture of 6 ounces of beeswax, 7 ounces of suet, and 1 pound of dry color, with half an ounce of oil of cedar.

190,769—May 15, 1877. A. KIESELE. *Improvement in compositions for casting ornamental figures.*

A composition consisting of paraffin, 1 pound; stearine, 4 ounces; and pulverized sugar, 12 ounces.

192,773—July 3, 1877. O. LONG AND P. H. DRAKE. *Improvement in adhesive substances.*

It consists of a solution of worn-out printers' inking rollers (composed of glue and molasses, or glue, glycerine, and molasses) with the addition of tobacco to render it insect proof.

193,213—July 17, 1877. H. BAYLE. *Improvement in compositions for molded articles.*

A compound consisting of 100 pounds of papier-maché, 20 pounds of gum arabic, and 5 to 6 ounces of bronze powder.

198,884—January 1, 1878. J. B. HAYDEN. *Improvement in composition for molded articles.*

Flexible threads or strips of wood cut with the grain and irregularly crossed—as excelsior—is saturated with glue and compacted under pressure.

201,067—March 5, 1878. J. W. SWARTS. *Improvement in crayons.*

Composed of glue, 8 parts, and an alkali, as a solution of carbonate of soda, 1 part, boiled to a hard saponification of the mass; and 1 part of the same mixed with 3 parts of paraffine wax and coloring matter.

201,283—March 12, 1878. C. C. PARSONS. *Improvement in compositions for crayons.*

Composed of clay, fatty matter, resin, and coloring matter melted together, as hard tallow, 4 parts; resin, 1 part; powdered clay, $1\frac{1}{2}$ parts, and lamp black, one-half part.

201,348—March 19, 1878. J. W. & C. M. HYATT. *Improvement in siliceous material to imitate ivory and similar substances.*

An alkaline silicate, as silicate of soda, is used to agglutinize a solid animal tissue. Comminuted bone, horn, or ivory is mixed with the silicate of the consistency of sirup, and molded or rolled into sheets and dried, or treated with heat and pressure. The composition is treated with calcium chloride to render the silicate insoluble.

202,636—April 23, 1878. W. H. DIBBLE. *Improvement in composition for manufacturing molded articles.*

A dry pulverulent composition formed by indurating and pulverizing blood in combination with animal, vegetable, or mineral solids—about equal parts by weight when dried

206,007—July 16, 1878. G. R. EVANS. *Improvement in nonconducting compounds.*

A fire-resisting and nonconducting compound, consisting of 3 or 4 parts of pulverized petrified wood, 1 part of mica, and 1 part of talc, with sufficient clay or other material to make a pasty mass.

208,036—September 17, 1878. J. ROBLEY. *Improvement in manufacture of floor cloth.*

A mixture of sawdust, ground wood, or other vegetable matter, with copal varnish and dry paint or mineral coloring matter, spread on a canvas, textile, or fibrous base.

209,528—October 29, 1878. C. WALPUSKI. *Improvement in the manufacture of colored crayons.*

A composition consisting of a suitable base, as kaolin, with starch and gelatinous matter combined with coloring matter; (the colors can be worked in a dry state and fixed on paper with water).

210,204—November 26, 1878. A. KEMPENNER. *Improvement in plastic composition for the manufacture of aquarium frames, etc.*

A mixture of sand, fire clay, coal tar, and asphaltum.

215,757—May 27, 1879. A. KIESELE. *Improvement in compositions for casting ornamental figures.*

A mixture of 5 parts of paraffin with 2 parts of starch.

217,360—July 8, 1879. J. C. FRIEDRICHS. *Improvement in compounds for forming letters, figures, or ornaments.*

A mixture of one-half pound of umber, one-quarter pound of litharge, 5 pounds of plaster of paris, 1 pound of clay, one-quarter pound of terra-sienna, 2 pounds of boiled oil, 1 pound spirits of turpentine, and one-half pound of Japan drier.

217,705—July 22, 1879. W. F. NILES. *Improvement in the manufacture of ornamental buttons from blood and other materials.*

A compound formed of powdered blood and colored, lumped, powdered blood with a gelatine or albumin substance, molded with pressure and heat.

218,538—August 12, 1879. J. B. KING. *Improvement in compositions for walls and ornaments.*

A mixture of 3 parts of clay; 1 part pulverized lava; 1 part dextrine or similar gum; 1 part fibrous material, as cotton, paper, wool, or asbestos; 1 part ground plumbago, and 1 part pulverized glass, with sufficient water to render the mass plastic, with or without a small quantity of plaster of paris.

221,825—November 18, 1879. L. E. JANNIN. *Improvement in composition for stereotype molds.*

A mold or matrix for forming stereotype plates is made of a cement composed of protoxide of lead and glycerine.

221,881—November 18, 1879. H. P. WEBB. *Improvements in paints for filling the seams of vessels.*

A quick drying liquid-gum vehicle, composed of resin dissolved in naphtha, combined with an earthy base, as red oxide of iron.

223,593—January 13, 1880. A. KRYZINSKI. *Composition for covering moldings.*

Composed of a solution of glue, 4 pounds; rye-flour, 8 pounds; and whiting, 190 pounds.

223,869—January 27, 1880. N. ULLMAN AND M. D. STILES. *Crayon compound.*

Formed of lampblack, 16 parts; alcohol (95 per cent), 48 parts; and Siberian lead or graphite, 1 part; all by weight.

223,880—January 27, 1880. J. BURBRIDGE, R. C. THORPE, AND T. OAKLEY. *Composition for elastic rollers.*

Composed of sulphurized oil, fibrous material, and gum-resin or pitch; as from $3\frac{1}{2}$ to $4\frac{1}{2}$ pounds of fibrous material added to $1\frac{1}{2}$ pounds of gum-resin and combined with 6 pounds of sulphurized oil. The rollers are subjected to a heat of about 150° C. for about three hours.

225,261—March 9, 1880. O. F. WOODWARD. *Composition of matter for making molded articles of manufacture.*

Gypsum and resin mixed together under heat—say in the proportion of 5 parts of the former to 4 of the latter.

225,679—March 16, 1880. A. T. WOODWARD. *Plastic compound.*

A mixture of pulverized silica—such as flint, glass, or sand—and a mineral or vegetable resin or pitch, with or without boiled linseed oil or other drying oil, or turpentine, or benzine; impervious to water and suitable for insulating purposes.

225,817—March 23, 1880. T. FLETCHER. *Composition for filling teeth.*

A paste composed of alumina pyrophosphate or phosphate triturated with phosphoric or pyrophosphoric acid and mixed with a substance capable of combining therewith and taking up excess of acid and solvent, as powdered hydrate of alumina, magnesia, or heavy oxide of lead.

226,547—April 13, 1880. J. L. POPE. *Composition of matter.*

A mass of pulverized cork mixed with a suitable binder (colored or not), with or without any suitable substance susceptible of taking a polish, and solidified by pressure.

226,583—April 20, 1880. I. B. ABRAHAMS. *Plastic composition of matter for the manufacture of jewelry and fancy articles.*

One part of glue is dissolved in 2 parts of slightly acidulated water and mixed with 1 part of resin or shellac liquefied by heat and the addition of turpentine, when 4 parts of starch and a dilute acid is added with heating.

226,738—April 20, 1880. T. FLETCHER. *Composition for filling teeth.*

A solution of phosphate of tin in phosphoric acid is combined with the powdered product of a mixture of lime 1 part, and silica and alumina each 5 parts, fused together.

227,291—May 4, 1880. E. L. ORMSBEE. *Substance for mounting stuffed birds, etc.*

A mixture of glue, sand or sawdust, and Marseilles green, in about equal proportions; it forms an imitation of wood.

227,352—May 11, 1880. E. EVERHART. *Composition for insulating telegraph wires, coating metals, covering roofs, and for other purposes.*

A mixture of 250 pounds of asphalt and 100 pounds of resin, with 20 pounds each of powdered charcoal and infusorial earth.

229,491—June 29, 1880. P. L. SYLVESTER. *Manufacture of buttons from plastic material.*

An ornamental coating of tinsel, foil, brocade, or gold sand, combined with shellac; produced by mixing shellac and the tinsel, etc., with heat, then pulverizing, and sprinkling the surface of the mold with the powder.

229,494—June 29, 1880. P. L. SYLVESTER. *Manufacture of buttons from plastic material.*

A plastic material composed of bleached shellac, 1 part, and mineral white (carbonate of lime), 2 parts, without pigments.

231,540—August 24, 1880. J. COLLINS. *Lining gas generators, acid chambers, and fountains for mineral waters.*

Powdered asphaltum with sufficient deodorized benzine to form a thick paste is heated until the asphaltum is dissolved, and powdered plumbago added, pound for pound.

231,736—August 31, 1880. J. TAYLOR. *Manufacture of flexible tubes.*

A coating composition consisting of 4 ounces of a product, obtained by dissolving 1 ounce of alum with 1 pound of linseed oil and boiling, mixed with 1 pound of molasses and 1 pound of gum arabic.

235,909—December 28, 1880. G. F. SENTER. *Composition from mineral wool for journal bearings.*

Three parts of mineral wool and 1 part of plumbago are mixed and ground together and sufficient water glass added to form a paste, which is molded into a compact mass with heavy pressure, dried, and dipped in melted paraffin or other unctious material.

236,034—December 28, 1880. J. W. HYATT, C. S. LOCKWOOD, AND J. H. STEVENS. *Factitous material to imitate ivory, horn, etc.*

Bone dust is welded by heat and pressure, with or without the admixture of a water repellant, as a gum solution, or an acid, as boracic acid, to facilitate the welding.

236,480—January 11, 1881. S. BARR. *Compound for manufacture of gas tubing.*

A mixture of glue, 10 pounds; glycerine, 12 pounds; soap, 4 ounces; borax, 1 ounce; and copperas, three-fourths of an ounce; with sufficient water, using heat, to form a paste.

237,569—February 8, 1881. H. B. MEECH. *Dry-ground pulp.*

The pulp of rags, jute, straw, or other wet-pulped vegetable fibers, is dried and then ground or pulverized to a fine powder for admixture with varnishes, gums, or oils.

238,980—March 15, 1880. J. B. SPENCE. (*Reissues: 9,982, 9,983, and 9,984—December 30, 1881.*) *Manufacture of metallic compounds from sulphur and sulphides.*

"Spence's metal," composed of metallic sulphides, as sulphide of iron and sulphide of copper, and sulphur; formed by pulverizing the sulphide and combining it with fused sulphur.

239,409—March 29, 1881. W. A. WALLER AND J. P. HITCH. *Composition for slating surfaces of blackboards.*

A mixture of 1 pound of lampblack and 1 pound of gum arabic in water with 8 pounds of Spanish white and 16 pounds of plaster of paris added.

239,466—March 29, 1881. E. J. DE SMEDT. *Insulating or nonconducting compound for electrical purposes.*

Telegraph wires and electrical conductors are insulated or covered with an oxidized hydrocarbon obtained by treating coal tars and the heavy oils of petroleum with an oxidizing agent.

239,951—April 12, 1881. W. M. GRAZE. *Plastic composition from paper-pulp for floors, brake-shoes, journals, etc.*

A composition of matter, and articles made thereof, consisting of a mixture of paper-pulp and metallic fillings (with or without a sizing of oil, resin, paraffin or the like) solidified under pressure.

242,758—June 14, 1881. C. CRABTREE. *Composition to be used in making squibs waterproof.*

A mixture of 1 pound of beeswax, 3 pounds of flowers of sulphur, 1 pint of alcohol and one-half pound of gum shellac.

244,321—July 12, 1881. J. C. SELLARS. *Composition for molds and composition-mold for forming concrete.*

A lubricating binding material not affected by alkalis, such as paraffin, combined with sand or charcoal.

244,486—July 19, 1881. E. ROSENZI. *Composition of matter for molded articles to resemble glass and iron.*

It consists of sand, 100 parts; coal ashes, 40 parts; lime (burned), 10 parts; with arsenic, magnesia, borax, and soda, in variable quantities, fused in a crucible and cast.

246,391—August 30, 1881. J. R. HOWELL. *Composition of matter to be used in the ornamentation of moldings and picture frames and the manufacture of light hollow ware, toys, trays, etc.*

A mixture of 8 pounds of glue, 6 pounds of resin, 2 pounds of paper pulp, and 2 quarts of linseed oil, thickened to a paste while hot by the addition of whiting.

247,797—October 4, 1881. M. W. BROWN. *Composition of matter.*

A composition consisting of skin glue or gelatine, water, glycerine, carbonate of lime, and earth paint, to be applied to paper or fabrics to render them flexible, tenacious, and resistant to wear.

248,324—October 18, 1881. H. W. JOHNS. *Asbestos material and process of manufacturing the same.*

Asbestos is reduced to fibers; formed into a bat, with or without wires or cords placed therein; moistened, as with a glutinous or waterproofing solution; and subjected to pressure.

250,257—November 29, 1881. O. O. KARSCH. *Composition for artificial-wood ornaments.*

Ten pounds of glue dissolved in 4 quarts of water is combined with 6 pounds of resin dissolved in 1 quart of linseed oil with heat, and sifted whiting and plaster of paris added and molded while warm and plastic.

251,473—December 27, 1881. F. W. SCHROEDER. *Insulating composition or compound for coating electric and other wires or conductors.*

A compound formed from 2 pounds of glue, 16 ounces of mastic, 14 ounces of dextrine, 9 ounces of asbestos, $2\frac{1}{4}$ ounces of chrome-alum, one-fourth of an ounce of chloride of iron, and 16 ounces of glycerine, with or without the addition of 8 to 20 ounces of albumen.

251,474—December 27, 1881. F. W. SCHROEDER. *Insulating composition or compound for coating electric and other wires or conductors.*

The composition is like that of No. 251,473, with the omission of asbestos.

251,970—January 3, 1882. J. TAYLOR. *Coating and insulating wire for electrical purposes.*

A coating of benzoin is applied directly to the wire or outside of a fibrous coating.

253,200—February 7, 1882. T. GUILFORD. *Composition for buttons, etc.*

A mixture of pulverized horn or hoof and steatite, with or without coloring pigments.

254,461—March 7, 1882. J. D. CHEEVER. *Waterproof composition.*

A composition, consisting of short fibers, as of jute, 30 pounds; spent tan bark powdered, 50 pounds; pulverized pagodite or agalmatolite, 30 pounds; powdered red chalk or red oxide of iron and clay, 20 pounds; and flour sulphur, 1¼ pounds, mixed in a mill, with the addition of 10 pounds of vaseline and 20 pounds of caoutchouc—the latter made miscible with coal tar or petroleum naphtha. Burlap is prepared to receive a coating of the above by applying to the same, by hot calendering, a composition of glue, yellow soap, and alum.

254,964—March 14, 1882. B. HARRASS. *Plastic compound.*

For making imitation wood objects, a mixture of 3 parts of paper pulp or cellulose, 1 part of starch, and 2 parts of flour, boiled, and converted into a fibrous paste, is mixed with sawdust; or a mixture of 2 to 10 parts of cellulose, 6 to 30 parts of sawdust, 1 to 5 parts of binding material—as dextrine, albumen, etc.—1 to 5 parts of flour and one-eighth to 2 parts of clay, chalk, etc., for backing veneers.

255,937—April 4, 1882. M. B. CHURCH. *Plastic material.*

For wall covering, a mixture of 5 to 8 pounds of glue, with 1 to 1½ pounds of sulphate of zinc, and 100 pounds of plaster.

257,706—May 9, 1882. W. C. HORNE. *Crayon.*

A luminous substance, such as a phosphorescent powder, is combined with a base or vehicle to form a paste which is molded and dried. It makes luminous marks.

258,549—May 30, 1882. F. BOREL. *Insulating material for electrical conductors.*

A siccative oil, such as linseed oil, transformed by heat into a solid elastic mass, with or without an admixture of a resinous matter, such as colophony.

259,878—June 20, 1882. C. S. LOCKWOOD. *Plastic composition for the cores of billiard balls, and for other purposes.*

Comminuted and desiccated glue, with or without glycerine, is welded and agglutinated by heat and pressure.

261,623—July 25, 1882. H. W. MORGAN. *Preparation of whalebone.*

A solution of whalebone, formed by dissolving shavings, cuttings, etc., in an alkali.

262,427—August 8, 1882. W. M. JACKSON. *Gas-proof cement.*

A compound of glycerine, 24 parts; gelatine, 1 part; and litharge or yellow oxide of lead, 30 parts.

264,771—September 19, 1882. M. W. SAMUEL. *Method of and means for the production of figures in relief on various substances.*

An adhesive plastic, consisting of 45 per cent of wax and 50 per cent of powdered resin, combined with heat, to which 5 per cent of Venice turpentine is added, with boiling.

266,053—October 17, 1882. J. J. SACHS. *Production of materials for castings, cements, lead pencils, etc.*

A composition consisting of sulphur and plumbago or other nonmetallic substances or mixtures, in the proportion of 4 parts of the former to 3 parts of the latter, or thereabout.

266,493—October 24, 1882. W. MATT. (*Reissue: 10,343—June 19, 1883.*) *Artificial stone for veneers, etc.*

A mixture of glue, 6 pounds; resin, three-fourth of a pound; linseed oil, 1½ pounds; paper pulp, 1 pound; glycerine, one-fourth of a pound; and steatite or its equivalent, and coloring pigments.

267,045—November 1, 1882. R. S. WARING, AND J. B. HYDE. (*Reissue: 10,350—July 3, 1883.*) *Insulating material for electric uses.*

An insulating compound composed of two or more of the heavier products arising from the redistillation of the residuum of petroleum, as obsidine tempered with a softer residuum product to give flexibility.

267,046—November 7, 1882. R. S. WARING. (*Reissue: 10,351—July 3, 1883.*) *Insulating compound for electric wires.*

A compound consisting of the liquid distillates of the residuum of petroleum with resinous or bituminous substances, together with clay, chalk, pulp, or like material.

271,120—January 23, 1883. W. F. RIKEMAN. *Composition for covering piano keys, etc.*

It consists of a mixture of gypsum, 60 parts; shellac, 30 parts; silica, 10 parts; and ivory black, 10 parts.

271,994—February 6, 1883. D. M. STEWARD. (*Reissue: 10,344—June 19, 1883.*) *Electrical insulator.*

Steatite, in a natural block cut into the desired form, or in the form of powder, is hardened or vulcanized by treating it with ammonia and muriatic acid and then subjecting it to heat. The vulcanized powdered steatite is mixed with a binding material, as plaster of paris, and molded.

274,622—March 27, 1883. J. F. MARTIN. *Insulating compound for electrical work.*

A mixture of marble dust, plaster of paris, and glue size; it is formed into tubes.

275,123—April 3, 1883. I. R. BLUMENBERG. *Indestructible compound for lining and coating tubes, cylinders, and other vessels, electric wires; also for joint packing, taking impressions, making castings, molds, and ornaments, and ornamental work.*

A compound of lampblack, about 4 per cent; asbestos, 20 per cent; litharge, 45 per cent; and glycerine, 31 per cent.

275,422—April 10, 1883. S. F. SHELBOURNE. *Insulating compound for electric conductors.*

A compound of paraffine and one or more of the heavier and separate distillates passing over in the redistillation of the residuum of petroleum.

275,904—April 17, 1883. C. GRUNZWEIG AND P. HARTMANN. *Artificial cork.*

A composition formed of boiled starch and powdered cork.

276,607—May 1, 1883. G. J. LESSER. *Plastic and elastic composition for forming elastic rolls, elastic pads, and for other useful purposes.*

A compound of glue, 25 pounds; gelatine, 6 pounds; glucose, 25 pounds; extract of lead, 1 pound; and glycerine, 15 pounds; formed by first forming a glue or gelatine with the lead compound, and combining said compound with a compound of glue and glucose with the glycerine added.

276,891—May 1, 1883. J. G. SANDERSON. *Insulating electrical conductors.*

A pulverulent mixture of nonconducting metallic oxide—as the sesquioxide of iron—and sulphur is mixed with melted bitumen.

276,998—May 8, 1883. S. BARR. *Compound for coating gas-tubing.*

A mixture of glue, 30 pounds; glycerine, 30 pounds, and bichromate of potash, 1¼ ounces.

277,707—May 15, 1883. P. E. GONON. *Manufacture of lead-pencils.*

A pencil consisting of a marking core surrounded by material, as wood pulp, pressed around the core in a plastic or semifluid state. (Claims for the apparatus.)

278,481—May 29, 1883. S. M. ALLEN. *Material for roofing purposes.*

Powdered or pulped fiber is mixed with heated asphalt and the paste formed into sheets, or applied to a web or backing of paper or other fabric.

278,536—May 29, 1883. J. GREIVES. *Electrical insulating material.*

A compound consisting of chalk and colophony, and containing from 40 to 90 per cent of chalk.

279,492—June 12, 1883. A. MEUCCI AND T. DENDI. *Plastic paste.*

A composition consisting of gelatine or a substance containing gelatine, 2 to 4 parts; fiber deprived of its mineral, gummy, and resinous substances, one-fourth to one-half part; an acid, as dilute muriatic acid, 1 to 2 parts; starch or analogous substances, 1 to 2 parts; varnish, 1 to 2 parts; oxide of zinc, 6 to 8 parts; and terra-alba, 2 to 4 parts.

281,999, July 24, 1883. J. B. HYDE. (*Reissues: 10,403; 10,404—November 6, 1883.*) *Insulating compound for electrical conductors and apparatus for compounding and applying the same.*

A compound composed of petroleum or mineral oils combined under heat, in a closed vessel, with the hard bituminous residuum from petroleum distillation.

282,014—August 7, 1883. J. F. MARTIN. *Compound for electric-wire insulators.*

A compound of asphaltum and from 40 to 60 per cent of fine marble dust.

283,044—August 14, 1883. D. B. TURNER. *Composition to insulate, preserve, and protect wire for electrical purposes.*

A compound formed of 1 part by weight of castor oil, and 5 parts of the black resinous substance obtained as a residuum of oil distillation, and known as "Nubian pitch," "Nubian gum," and "colophony niger."

283,200—August 14, 1883. H. R. BRISSETT AND J. HOWE. *Composition for coating and insulating underground wires.*

A composition of cottonseed oil, 30 ounces; Venetian turpentine, 30 ounces; resin, 18 ounces; asphaltum, 39 ounces; steatite, 48 ounces; paraffine, 16 ounces; pine tar, 12 ounces; sulphur, 17½ ounces; and red lead, 15 ounces.

283,526—August 21, 1883. J. W. STANSBURY AND J. M. HEDRICK. *Lining for burial caskets, etc.*

A compound composed of 3 pounds of alcohol, 4 pounds of white lead, 3 pounds of gum shellac, 1 pound of white glue, and plaster of paris.

283,793—August 28, 1883. C. S. LOCKWOOD. *Plastic material.*

A compound consisting of 8 pounds of powdered bone or similar material, 2 ounces of phosphate of ammonia or its elements, and 2 pounds of powdered shellac, may be subjected to pressure in heated molds or r ixed with a solvent and mixing rolls.

283,794—August 28, 1883. C. S. LOCKWOOD. *Plastic material.*

Eight pounds of pulverized and desiccated bone is mix . with 2 ounces of phosphate of ammonia and subjected to pressure in heated molds.

283,796—August 28, 1883. C. S. LOCKWOOD. *Zincated bone.*

Bone dust or like material is mixed with sulphate of zinc, the mixture submitted to a water bath, and then the free acid washed out to render the gelatine insoluble.

283,797—August 28, 1883. C. S. LOCKWOOD. *Plastic material.*

A mixture of tannate of iron and bone or horn dust is subjected to pressure in a heated mold, as 8 parts of bone dust and 2 parts of tannate of iron, or a mixture of 16 parts of bone dust, 4 parts of solid extract of logwood, and 1 part of sulphate of iron made into a solution, and the moisture expelled.

284,098—August 28, 1883. R. S. WARING. *Insulating material and preparation of the same.*

An insulating material for lead-covered cables: produced by subjecting natural asphaltum, or the heavier distillates or residual products of petroleum to a degree of heat above the vaporizing point of water, to eliminate the latter and the light and easily decomposed products—approximate, 175° C.—but below the point at which destructive distillation or cracking begins.

287,346—October 23, 1883. C. J. VAN DEPOELE. *Insulating material.*

A mixture of silicate of soda with earthy substances or metallic oxides, as zinc white or red lead; paper is saturated therewith.

287,994—November 6, 1883. H. ARMSTRONG AND J. A. LOUDON. *Boiler-covering.*

Fibrous peat, separated or disintegrated from the bulk of its earthy matter, is mixed with cement as a covering for steam-pipes, boilers, etc.

288,112—November 27, 1883. W. MATT. *Artificial stone for veneers, molded articles, etc.*

A compound consisting of glue, 10 pounds; asbestos, 10 pounds; linseed oil varnish, one-half pound; colophony, one-half pound; glycerine, 1 pound; turpentine, 1½ pound; with steatite or kaolin and pigments.

289,237—November 27, 1883. L. EBERLE. *Composition for gilt moldings.*

A mixture of one-half pound each of stick-lac and sandarac, and one-eighth pound each of galipot, gamboge, and dragon's blood in alcohol.

290,057—December 11, 1883. J. BURROWS HYDE. *Insulating compound for electric conductors.*

Mineral and coal-tar bitumens are melted and combined with petroleum or mineral oil. In coating thread-covered electric wires with an insulating medium, the covering is saturated with a volatile fluid, as crude petroleum, before the wire enters the heated insulating composition. The waste vapors evolved are stored in a sealed and floating holder and used for heating the furnace.

290,058—December 11, 1883. J. B. HYDE. *Insulating compound for electric conductors and the process of compounding the same.*

A compound of dry powdered peat with bituminous substances and hydrocarbon fluid added under heat; short lengths of vegetable fiber may be added to the melted composition.

290,888—December 25, 1883. F. J. KALDENBERG. *Manufacture of articles from waste amber.*

Articles made of pieces of amber and gum animé molded together: formed by pulverizing the gum, mixing it with pieces of amber, and subjecting it to heat and pressure.

291,164—January 1, 1884. A. DICKMAN AND M. HEINTZ. *Veneer.*

A composition veneer built up in alternate layers or wood shavings and glue; the shavings are cut to particles of a uniform size.

291,284—January 1, 1884. E. BRADY. *Composition of matter for molding fruits, fancy-topped tables, birds, etc.*

It consists of 1 pound of pulverized hard stone, 1 pound of pulverized slate stone, one-quarter pound of common sand, one-quarter pound of white sand, one-sixth pound of pulverized clam shells, one-quarter pound of common brick, one-quarter pound of charcoal, 3 pounds of blue clay, 1 pint of linseed oil, and water.

291,716—January 8, 1884. J, GREIVES. *Electric insulating material.*

Caustic lime in powder, hydrated or otherwise, is combined with resin in a fused state, the lime being in excess; from 2 to 5 per cent of a fixed oil, as resin oil, may be added, to render the compound flexible.

291,717—January 8, 1884. J. GREIVES. *Electric insulating material.*

A compound of resin and natural silicate of magnesia—as talc or soapstone—combined by fusion, the silicate being in excess; from 5 to 10 per cent of a fat or oil is added to temper the compound.

291,718—January 8, 1884. J. GREIVES. *Electrical insulating material.*

It is composed of crystalline lime carbonate, as marble, spar, etc., reduced to powder and combined with resin by fusion of the latter, with or without the addition of powdered asbestos.

292,770—January 29, 1884. P. H. VANDER WEYDE. *Manufacturing a rot-proof covering for underground telegraph cables.*

The fibrous envelope of a metallic conducting wire is saturated with Utah elaterite or mineral wax, combined with from 5 to 10 per cent of bitumen.

292,956—February 5, 1884. M. SCHÜTZ. *Compound for preserving the soles of boots and shoes.*

It consists of 25 parts of shellac and 25 parts of alcohol, mixed with 50 parts of boiled linseed oil.

293,784—February 19, 1884. W. S. RAVENSCROFT. *Pulp caster-wheel.*

A caster wheel made of paper or wood pulp.

294,457—March 4, 1884. J. FOTTRELL. *Composition for electrical insulation.*

Metallic soap, which may be formed from a common brown soap and an alum solution, alone or combined with benzine, turpentine or gasoline, and linseed oil and varnish, and with or without a thickening material, as white lead.

297,626—April 29, 1884. J. H. PAGE. *Indestructible compound for coating wires for electrical purposes.*

A compound of litharge and glycerine, formed into a thick paste.

298,072—May 6, 1884. D. H. DORSETT. *Insulating material.*

The residuum of 50 gallons of coal tar, distilled until it will resist 55° to 60° C. without softening, combined with 2 gallons of crude petroleum paraffine, 100 pounds of fine silicious sand, and 50 pounds of pulverized coal-ashes and cinders, with or without one-half pound of black oxide of manganese and one-fourth pound of ammonia chloride.

300,464—June 17, 1884. L. HAAS. *Compound material for the manufacture of sheets, boards, blocks, artificial wood, etc.*

Eighty per cent of wood or vegetable fiber and 20 per cent of scrap leather and shoe waste or shoddy waste and crude asbestos are ground or reduced to a fiber, the moisture evaporated, and mixed with thinned asphaltum blended with a suitable quantity of pitch, sulphur, whiting, crude asbestos, and litharge.

300,729—June 17, 1884. O. F. PARSONS. *Fire and water proof compound.*

A mixture of 20 gallons of coal tar, 12 pounds of air-slacked lime, 7 pounds of Spanish brown, 6 pounds of sulphur, 2 pounds of litharge, 8 pounds of salt, and 7 pounds of American ocher.

302,977—August 5, 1884. W. M. BRASHER. *Floor-covering.*

One hundred and twenty pounds of litharge is added to a solution of 120 pounds of sugar of lead in 100 gallons of water, and 10 gallons of the same is then mixed with 300 pounds of whiting, 300 pounds of ocher, 10 gallons of glue size, 10 pounds of wood pulp, and 20 gallons of linseed oil (three-fourths raw and one-fourth boiled). It is spread on a textile base.

303,301—August 12, 1884. C. LORTZING. *Art of making artificial asphaltum from the residue of tanneries.*

The precipitated residuum of the waste waters of tanneries and the like is dried, powdered, mixed with powdered limestone, and subjected to heat and pressure; the product possesses all of the qualities and appearance of asphaltic mastic.

304,020—August 26, 1884. C. G. MUSKAT. *Composition for covering and insulating electric wires.*

One pound of castor oil is boiled with 2 pounds of gum copal and incorporated with 3 pounds of powdered slate.

304,775—September 9, 1884. S. BARBIER AND C. H. COIFFIER. *Composition to be used as a substitute for hard india-rubber, celluloid, iron, and the like.*

A mixture of ivory waste, or dust, and horn agglomerated by means of albumen.

305,205—September 16, 1884. C. S. LOCKWOOD AND J. W. HYATT. *Plastic material to imitate ivory, etc.*

Organic or analogous material is thoroughly comminuted, say to one twenty-thousandth of an inch, and then subjected to heat (160° C.) and great pressure in a mold; a homogeneous mass being formed without the use of adhesives.

307,184—October 28, 1884. A. DERROM. *Composition mastic for covering roofs, telegraph-wires, and the like.*

A mixture of "crude, hard Venezuelan bitumen" and purified, soft Venezuelan bitumen.

308,778—December 2, 1884. C. T. LEE. *Composition for making nonconducting handles for sad-irons, etc.*

Powdered mica, or like material, is combined with glue which has been treated with acetate of iron, so that the mass does not soften with moisture.

310,899—January 20, 1885. M. MACKAY. *Plastic compound suitable for molding into various useful articles, such as screw-stoppers for bottles, jars, etc.*

It consists of a compound of 75 pounds of lac, 38 pounds each of gum-sandarac, resin, and ivory-black, and 168 pounds of asbestos or other suitable fibrous material or silicates.

311,875—February 10, 1885. R. P. COUGHLIN. *Manufacture of clock-cases, statuary, vases, and other articles from plastic materials.*

A composition of Keene's cement, resin, and alum, with or without coloring matter. A composition for dyeing artificial marble consists of extract of logwood, copperas, tincture of iron, and water.

316,374—April 21, 1885. S. KRAUS. *Artificial slate pencil.*

Colored slate pencil, formed of coloring matter, 10 pounds; talc, 5 pounds; and potters' clay, 10 pounds; mixed, formed, and baked.

317,388—May 5, 1885. C. S. LOCKWOOD AND J. W. HYATT. *Process of treating silicate of soda in combination with zinc oxide, etc.*

A composition, and articles formed thereof, consisting essentially of silicate of soda and zinc oxide, combined, comminuted and partly dehydrated; produced by forming an aqueous solution of the silicate of soda with an admixture of zinc oxide in the proportion of 4 parts of silicate (26° Baumé) to 1 part of zinc oxide, comminuting it, and subjecting it to treatment in an ammoniacal bath.

319,084—June 2, 1885. J. A. FLEMING. *Preparation and production of insulating materials.*

Finely divided wood, or other vegetable fibrous material, is desiccated and impregnated with a mixture of melted bitumen or asphalt incorporated with silicates of magnesia, or lime, iron, alumina, or of two or more of them, and with amber resin, or other resin having a high melting point, as kauri, and molded under pressure.

321,956—July 14, 1885. J. W. ELLIS. *Composition of matter for the preservation and insulation of wires.*

A compound of roofing pitch with sulphur, one thirty-second part; resin, one-sixteenth part; and lime, one thirty-second part.

322,803—July 21, 1885. A. G. DAY. *Vulcanized product, termed "kerite."*

A compound formed by the mixture of cottonseed oil, linseed oil, coal tar or bitumen, and the sulphide of antimony or other suitable sulphide (product of No. 322,802).

322,805—July 21, 1885. A. G. DAY. *Vulcanizable compound, or crude kerite.*

A compound formed by the mixture of vegetable astringents with cottonseed oil, linseed oil, and coal tar or bitumen (product of No. 322,804).

322,996—July 28, 1885. S. P. M. TASKER. *Manufacture of leathery compound.*

Fibrous material—animal, vegetable, or mineral—is saturated with gelatine, molded or worked into the desired form, and then treated with tannic acid.

325,890—September 8, 1885. I. P. WENDELL. *Composition of matter for use as insulating material.*

A mixture of 2½ pounds of asbestos, one-half a pound of antimony, one-eighth of a pound of sulphur, and 2½ pounds of liquid silicate of soda.

325,891—September 8, 1885. I. P. WENDELL. *Composition of matter for use as insulating material.*

A mixture of 2 pounds of asbestos or talc, 1 pound of litharge, one-half a pound of antimony, and 3 pounds of liquid silicate of soda.

327,462—September 9, 1885. H. C. SPALDING. *Insulating compound for electrical cables, etc.*

A permanently viscous or plastic insulating compound consisting of boiled linseed oil and crude turpentine.

327,477—September 29, 1885. H. C. SPALDING. *Compound for insulating underground electric conductors.*

A permanently plastic insulating material, as a filling for underground conduits containing electric conductors, consisting of refined asphalt, 90 parts, and petroleum residue, 10 parts.

328,366—October 13, 1885. C. WALPUSKI. *Composition for pencil-leads and crayons.*

A composition consisting of a base—such as potter's clay—a binding medium, and two distinct colors—a writing color and a copying color.

329,349—October 27, 1885. W H. WIGGINS. *Substitute for billiard-cue chalk.*

Finely granular barytes is mixed with liquid dextrine, with or without a small percentage of gypsum, and molded into blocks.

334,782—January 26, 1886. F. KIMBLE. *Making targets.*

Composed of pitch, 100 pounds, and plaster of paris, or whiting, 25 to 75 pounds.

334,974—January 26, 1886. A. A. OLIVER. *Composition of matter for roofing, furniture, etc.*

A composition of manila or other fibrous stock, say, 1,000 pounds; asbestine powder, 1,000 pounds; linseed oil, 170 pounds; oil of tar, 170 pounds, and tungstate of soda, 90 pounds; with or without ground emery, 50 pounds.

337,472—March 9, 1886. S. M. ALLEN. *Composition of matter for making molded articles.*

A mixture of, say, 100 pounds of asphalt, resin, or equivalent substance, with 10 pounds of a suitable nonvolatile oil—as Trinidad asphalt oil—and 700 pounds of wood pulp or other vegetable or animal fiber. The fiber is saturated with water or spirits preparatory to mixing with the resinous or gummy matter.

339,519—April 6, 1886. W. W. BARNES AND J. D. EMACK. *Composition of matter suitable for casting medallions, tiles, picture frames, moldings, etc.*

A mixture of soluble glass, 100 parts; ground flint, 80 parts; ground iron, 30 parts; and roll sulphur, 40 parts; combined by heating up to 180° C.

339,777—April 13, 1886. J. HOWE. *Composition to be used for insulating wires.*

A mixture of cottonseed oil, 1 quart; asphaltum, 5 pounds; white resin, 4½ pounds; paraffin wax, 1½ pounds, and Venetian turpentine, 2 pounds.

341,072—May 4, 1886. E. C. C. STANFORD. *Manufacture of useful products from seaweed.*

Algic acid is produced from seaweed by an admixture of an alkali with the seaweed from which the salts have first been extracted. One hundred parts of the washed seaweed is mixed with 5 parts of an alkali, as carbonate or hydrate of soda or biborate of soda, and the gelatinous solution separated from the undissolved ingredients.

341,757—May 11, 1886. G. A. LINDGREN. *Compound for preventing window frost.*

It comprises 1½ ounces of sodium chloride, 3¼ ounces of water, 7¾ ounces of glycerine, 2¼ ounces of isinglass, 1 ounce of cologne spirit, and one-half ounce of sulphuric acid.

342,377—May 25, 1886. R. F. NENNINGER. *Composition for floor and wall coverings, etc.*

A mixture of paper pulp in a dry state and the gummy viscous residue derived from heating linseed oil.

342,378—May 25, 1886. R. F. NENNINGER. *Process of manufacturing composition for floor and wall coverings, etc.*

Any fibrous material is molded or pressed into desired shape and dried, then treated with a gummy or resinous waterproof substance, as linseed oil, after heating to a high temperature, dissolved in a volatile solvent, such as naphtha, and finally the volatile solvent is evaporated.

342,684—May 25, 1886. J. W. & F. R. HOARD. *Insulating and protecting electric wires and cables.*

An electric conductor insulated with a covering of linseed or equivalent drying oil, highly oxidized throughout its mass by exposure to air or oxygen to the consistency of a jelly, and applied without a solvent.

344,823—July 6, 1886. J. FOTTRELL. *Composition of matter for the electrical insulation of wires covered with cotton, silk, or worsted braid or tape.*

A compound of boiled linseed oil, 6 gallons; oxide of zinc, 10 pounds; Venetian turpentine, 1 pound; lead shavings, 2 pounds; to which is added, after mixing and boiling, copal varnish, 1 gallon, and sandarac varnish, 1 pint.

345,542—July 13, 1886. A. L. REINMANN. *Cement for securing metal rings to electric-lamp bulbs and for other purposes.*

A mixture of 8 ounces of calamine and 4 ounces of chalk, and a suitable adhesive material, as glue, with or without a small amount of glycerine.

346,002—July 20, 1886. C. N. WAITE. *Marking crayon.*

A hygroscopic substance, such as glycerine or chloride of zinc, is combined with the crayon material, so that the marks formed will not form a dry powder or impair the surface of the board.

346,841—August 3, 1886. E. G. CHORMANN. *Composition for decorative purposes.*

It consists of a mixture of silex, an alkaline salt, carbon, clay, a metallic chloride, and a flux; to be used for coating purposes or to be molded.

347,565—August 17, 1886. O. BRACH. *Porous mass for blotting purposes and for making cigar pipes, etc.*

A porous compound consisting of vitreous sand, coarse river sand, pipeclay, and hogs-bean meal. The molded material is dried and burned at nearly the melting point of silver.

348,994—September 14, 1886. T. J. PEARCE AND M. W. BEARDSLEY. *Insulating wire and conductors for electrical purposes.*

A mixture of bisulphide of carbon and maltha is employed as an insulating coating.

349,751—September 28, 1886. A. H. ROWAND AND R. S. HUNZEKER. *Composition of matter for packing the joints of gas pipes, etc.*

It is composed of pitch and molasses.

351,611—October 28, 1886. R. ALEXANDER. *Compound for insulating telegraph wires, etc.*

A compound of mineral wool or glass-flock, say, 100 pounds; asphaltum, 60 to 70 pounds; and cement or carbonate of lime, 20 to 30 pounds. The glass-flock is treated to a hot bath of boracic acid previous to mixture to anneal or soften the fibers.

352,445—November 9, 1886. J. W. BUTLER. *Composition for the manufacture of blocks for containing electric wires or cables.*

A compound of trinidad or other bitumen, say, 15 pounds; crude paraffin, 12 ounces; Portland cement, 6 ounces; Aylesford sand or finely powdered limestone, 8 pounds; roughly pulped wood, or sawdust, or tan-yard waste, 8 pounds; with or without Taranaki sand, 8 ounces.

352,449—November 9, 1896. C. W. COLLINS. *Cement for pipe-joints.*

Composed of plaster of paris and limewater; the latter neutralizing any free acid.

352,852—November 16, 1886. D. BROOKS, JR. *Insulating material for electric wires.*

Resin and resin oil are combined in about equal proportions.

353,653—November 30, 1886. C. J. VAN DEPOELE. *Composition of matter for insulating electric conductors.*

A mixture of pulverized mica, silicate of soda, and a pulverulent earthy substance.

355,776—January 11, 1887. W. J. MICHELS. *Plastic composition for wall-hangings, etc.*

One hundred pounds of a vulcanized composition composed of a vegetable oil, as castor oil or castor oil and cottonseed oil, say 100 pounds; kauri gum, 25 pounds; resin, 6 pounds; camphor gum, 1½ pounds; and 25 pounds flowers of sulphur is mixed with 100 pounds of wood pulp and 1 pound of paraffin.

356,363—January 18, 1887. J. JAMETON. *Composition for blackboards.*

A mixture of coke-dust, 50 parts; soap-plaster, 39 parts; carbon-black, 10 parts; and graphite, 1 part.

356,411—January 18, 1887. T. McSWEENEY. *Composition for packing joints and other purposes.*

It consists of resin, 1 part, and mineral asphaltum, 4 parts, mixed together and melted, and 6 parts of the mixture combined with 6 parts of black wax-tailings, and 6 parts of thick yellow wax-tailings.

358,746—March 1, 1887. H. S. MEYERS. *Copying-pencil, etc.*

It consists of a soluble color (described), a soluble color with lime (described), mineral wool, soap, oxgall, and soap-paste. It gives copies in black.

361,347—April 19, 1887. C. T. CROWELL. *Dielectric composition.*

A mixture of sand or marble dust, 4 parts; pulverized glass, 1 part; lime, 2 parts; resin, 1 part; isinglass, 1 part; and coal tar or "unitite," 2 parts.

362,076—May 3, 1887. S. H. GILSON. *Composition for insulating and other purposes.*

A compound of gilsonite, 90 parts, and oil or fat, 10 parts; with or without india rubber.

366,263—July 12, 1887. R. F. SILLIMAN. *Underground cable for telegraph wires.*

Wires are coated with powdered mica mixed with caustic potash or soda, dried, and heated to a red heat.

366,336—July 12, 1887. H. W. MERRITT. *Compound for covering electric wires.*

A compound of quicklime, 1 pound, slaked in 1 quart of water; 1 pound of fir-balsam; 4 pounds of ground asbestos; 1 ounce of sugar, and a small quantity of oxalic acid, 3 grains, dissolved in hot water.

366,337—July 12, 1887. H. W. MERRITT. *Semielastic compound for covering electric wires, etc.*

Two pounds of fluid silicate of soda is substituted for the quicklime of No. 366,336.

366,898—July 19, 1887. J. TATHAM. *Insulating compound.*

A compound of 4 to 6 parts of resin to 1 part of cottonseed oil.

366,967—July 19, 1887. W. MATT. *Plastic compound for use in the decorative arts, etc.*

It consists of gelatine, 10 pounds; water; digested skins, cut into small pieces; Venetian turpentine, 2 pounds; linseed oil, 2 pounds; and resin, 6 pounds; thickened with the addition of 20 pounds of paper pulp, with or without marble dust.

369,099—August 30, 1887. N. J. CLAYTON. *Composition to be used as a nonconductor of heat and for other purposes.*

Cottonseed hulls, or waste or refuse of cottonseed oil mills are saturated with a solution of alum to render them incombustible, and then combined with sawdust treated with a hydrate of lime, and mixed with plaster of paris, in the proportion of 1 of plaster to 4 of hulls.

371,406—October 11, 1887. W. W. BARNES. *Plastic composition for insulating electric wires, etc.*

A mixture of mineral coal, 50 parts, and sulphur, 10 parts, each reduced to an impalpable powder and then mixed, and fused by heat. Also available for building and paving blocks, etc.

371,681—October 18, 1887. J. GRANT. *Conductor for electric wires.*

A compound of resin and petroleum residuum, forming a semiplastic mass.

372,552—November 1, 1887. T. McSWEENEY. *Composition for the manufacture of structural articles.*

A mixture of asphaltum, 60 pounds; resin, 20 pounds; and coal tar 20 pounds; the latter reduced to one-fourth of its bulk by boiling; 1 part of the aforesaid mixture being combined with 7 parts of paper pulp and 3 parts of pulverized glass or fine sand.

375,633—December 27, 1887. DE WITT C. JAMES. *Underground electric conductor.*

An inclosing and insulating compound of resin, pulverized glass, and sulphur.

376,456—January 17, 1888. C. WALPUSKI. *Copying pencil.*

Composed of nigrosine, tannate of iron, a suitable oleate, and a binding medium.

377,072—January 31, 1888. C. E. HAYNES. *Compound for making paper leather-board, etc.*

To a mixture in water of silicate of soda, 1.42 parts; rosin, 1.42 parts; alum, .76 parts; crude potassa, .4 parts; and fish glue, 2 parts; assisted by electro-chemical action, and heated, there is added 39 parts of pulp, and it is then manipulated in the ordinary way.

377,081—January 31, 1888. J. F. MARTIN. *Compound for coating iron, wood, canvas, etc.*

A base or body composed of glue, sulphureted water or sulphur in solution, paris-white and zinc white, with or without shellac and alcohol, and coloring matter.

377,343—January 31, 1888. I. P. WENDELL. *Compound for safe linings, etc.*

A mixture of fiber or powdered asbestos, fossil meal or infusorial earth, and silicate of soda; say in the proportions of 1 part each of asbestos and the earth, and 1 to 2 parts of the silicate.

382,832—May 15, 1888. J. A. KIESELE. *Composition of matter.*

Composition for castings, consisting of ozocerite and sugar; say 5 parts of the former and 5 to 7 parts of the latter.

383,096—May 22, 1888. D. BROOKS, JR. *Anti-induction composition for electric cables.*

A composition of low induction capacity, consisting of a powdered electrical conducting material, as plumbago, gum copal, linseed oil, and turpentine, in about equal parts.

383,698—May 29, 1888. C. F. BROADBENT. *Composition of matter to be used in the manufacture of medallions, etc.*

Sulphur and powdered pumice stone constitutes the base, with powdered antimony and boneblack.

386,064—July 10, 1888. H. F. FERRIS. *Material for railway-rails, building-blocks, paving-blocks, etc.*

A mixture of paper pulp 500 parts, silicate of soda 25 parts, and barytes 10 parts.

387,017—July 31, 1888. W. A. SNYDER. *Putty for making ornamental moldings.*

It consists of dissolved glue, resin, and whiting, combined with paraffine oil and spirits of turpentine.

387,041—July 31, 1888. W. S. BLAKE. *Tobacco-pipe bowl.*

A mixture of ground corncob and silicate of soda, with or without earthy material.

389,519—September 11, 1888. C. T. LEE. *Composition of matter.*

A laminated substance, such as mica, in a comminuted state, is mixed and incorporated with a resinous gum, such as shellac.

393,029—November 20, 1888. A. POITEVENT. *Insulating composition.*

A mixture of common lime, say 2 parts; crude turpentine, 1 part; and pine tar, 2 parts.

393,382—November 27, 1888. F. A. MEYER. *Plastic compound.*

A composition consisting of sulphur, fibrous material, finely divided mineral, and a waxy or similar substance, such as paraffine, whose fusion point is below that of the sulphur.

393,644—November 27, 1888. S. HEIMANN. *Non-conducting compound.*

A mixture of 60 pounds of dry, pulverized peat, 25 pounds of ground asphaltum, $2\frac{1}{2}$ pounds of pulverized plumbago, and a thin solution of 5 pounds of plaster of paris and of soluble glass; compacted by heat and pressure.

394,937—December 18, 1888. C. M. REQUA. *Composition of matter for marking pencils or crayons.*

A mixture of 7 pounds of paraffine, 1 pound of beeswax, and 1 pound of resin, with coloring matter.

395,241—December 25, 1888. E. LANGEN. *Substitute for cork.*

Powdered pith is mixed with an adhesive material—as starch, paste, and linseed oil or tar, to render the mass elastic—and dried; a fireproof material, such as water glass, may be added.

396,300—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

A refractory crystalline compound, for incandescent illumination: formed of magnesia oxide or carbonate, 37 per cent; caustic strontia, 37 per cent; calcium fluoride, 26 per cent; and feldspar (added after first heating), 3 grains to 100 grains of the prior mixture. The resulting powder is mixed in glycerine, molded or coated, and subjected to heat, it being white or opalescent, rough on the surface, and practically infusible.

396,301—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

A refractory crystalline compound for incandescent illumination: composed of magnesia oxide or carbonate, 50 grains; caustic strontia or carbonate, 55 grains; alumina oxide or carbonate, 10 grains; calcium-fluoride, 30 grains; and feldspar, five one-hundredths grain.

396,302—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

A refractory crystalline compound for incandescent illumination: composed of calcium oxide or carbonate, 210 grains; magnesia oxide or carbonate, 40 grains; caustic strontia or carbonate, 180 grains; alumina oxide or carbonate, 15 grains; calcium fluoride, 100 grains; and feldspar (added after first heating), 2 grains to 100 grains of the prior mixture.

396,303—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

A refractory crystalline compound for incandescent illumination: composed of calcium oxide or carbonate, 65 grains; magnesia oxide or carbonate, 50 grains; strontia oxide or carbonate, 30 grains; alumina oxide or carbonate, 15 grains; and cryolite, 20 grains.

396,304—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

A refractory crystalline compound for incandescent illumination: composed of calcium oxide or carbonate, 480 grains; magnesia oxide or carbonate, 96 grains; strontia oxide, 110 grains; strontia carbonate, 65 grains; feldspar, 100 grains; and aluminite or ammonia alum, 32 grains.

396,305—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

A refractory crystalline compound for incandescent illumination; composed of arragonite, or the caustic lime from arragonite, 80 grains; magnesia oxide, 160 grains: celestine or strontia sulphate, 350 grains; barium sulphate, 17 grains; and calcium fluoride, 142 grains.

396,306—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

A refractory crystalline compound for incandescent illumination: composed of celestine or strontia sulphate, 131 grains; magnesia carbonate, 96 grains; silica or silicic acid, 15 grains; carbonate of soda, 24 grains; and carbonate of potassa, 32 grains.

396,307—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

A refractory crystalline compound for incandescent illumination: composed of magnesia oxide or carbonate, 438 grains; strontia oxide (caustic), 342 grains; strontia carbonate, 90 grains; strontia sulphate, 90 grains; calcium oxide or carbonate, 208 grains; glucinium oxide or carbonate, 24 grains; with or without zirconium oxide, 20 grains; and fluor spar, as a flux, 230 grains.

397,612—Februrary 12, 1889. F. S. RANDALL. *Composition for making articles of commerce and art.*

A mixture of 2 parts of sawdust, 4 parts asbestos, 1 part alum, 2 parts dextrine, and 6 parts of glue mixed with 1 part of acetic acid.

400,335—March 26, 1889. J. L. HASTINGS. *Plastic mineral composition.*

A composition for forming a refractory compound for incandescent illumination, consisting of magnesium oxide, 250 grains; uranium oxide, $2\frac{1}{2}$ grains; calcium fluoride (for flux), 60 grains; starch, 50 grains; and gum-tragacanth, 100 grains; the gum being treated in a solution of one or more salts of acetate, chloride; or nitrate of magnesium, strontium, calcium, or aluminum.

400,336—March 26, 1889. J. L. HASTINGS. *Plastic mineral composition.*

A refractory compound for incandescent illumination, containing strontia oxide, strontia carbonate (native rock), strontia sulphate (native rock), calcium oxide, calcium carbonate, magnesium oxide, magnesium carbonate, calcium fluoride, magnesium chloride, magnesium sulphate, uranium oxide, and starch, in varying proportions.

401,014—April 9, 1889. A. DE FIGANIÈRE. *Insulating and coating compound.*

A hard fusible compound consisting of 6 parts of pulverized semibituminous coal, 2 parts of unslaked lime, and 7 parts of coal tar pitch.

403,548—May 21, 1889. B. E. OLSEN AND C. GABRIEL. *Compound for piping, bowls, etc.*

It consists of sand, 43 per cent; sulphur, 33 per cent; pitch, 1 per cent; and an earth, such as ground burnt clay, 23 per cent; mixed together under the action of superheated steam.

403,631—May 21, 1889. A. T. WOODWARD. *Plastic compound for use in various arts.*

It consists of 100 pounds of powdered silica or silicate—such as glass—50 pounds of mineral or vegetable resin or pitch, 150 ounces of oxide of lead or zinc, and the same of animal or vegetable wax, and 75 ounces of boiled linseed oil, with a slight admixture of drying oil.

406,427—July 9, 1889. J. R. CLUXTON. *Compound for the scrubbing surfaces of washboards.*

A mixture of 4 pounds of powdered fire clay, 1 pound of litharge, 1 pound of Spanish white, one-half pound finely granulated or powdered wood, one-fourth pound of pitch, and one-fourth pound of gum shellac, with a solvent oil, mixed with heat and molded.

407,271—July 16, 1889. A. T. WOODWARD. *Plastic compound.*

A compound of 50 pounds of silica, 10 pounds of sulphur, 2 pounds of arsenic, 5 pounds of manganese, and 25 pounds of resin, or gum, with or without 3 pounds of wax, and 5 pounds of oil.

407,896—July 30, 1889. F. MARQUARD. *Insulating composition.*

A compound of 20 pounds of wood pulp, 1 pound extract of logwood, one-eighth pound of bichromate of potash, one-eighth pound of sulphate of iron, 4 pounds of animal glue, 10 pounds of rosewood sawdust, and $2\frac{1}{2}$ pounds of an albuminous substance, as bullock's blood with or without vegetable fiber, such as flax, hemp, etc.; forming a dark, almost black material.

407,988—July 30, 1889. F. MARQUARD. *Insulating composition.*

A compound of 20 pounds of fine rosewood sawdust, 1 pound extract of logwood, one-eighth pound bichromate of potash, one-eighth pound sulphate of iron, and 5 pounds of an albuminous substance, such as bullock's blood, with or without vegetable fiber.

408,222—August 6, 1889. M. L. DEERING. *Composition of matter.*

It consists of fibrous material, blood, waterproof gum, and creosote, in the general proportions of 1 pound of fiber to 1 quart of blood.

408,951—August 13, 1889. C. S. BUSHNELL. *Process of packing roofing composition.*

The base material is placed in a shipping case and a tubular jacket introduced to form a chamber within said material. The ingredients with which the base is to be mixed are then melted and poured into said chamber, and the jacket removed, leaving the ingredients in the center surrounded by the base material.

409,584—August 20, 1889. J. L. HASTINGS. *Plastic mineral composition.*

A composition for forming a refractory compound for incandescent illumination, containing two or more metallic compound substances—such as oxides, carbonates, or sulphates of metals—a flux, a moistening fluid, and one of flame or light coloring substances, such as oxide of uranium, strontium, and lead chromate or chromium oxide, permanganic acid, cadmium sulphide, sodium salts, or indium oxide, and calcite.

409,985—August 27, 1889. C. T. LEE. *Composition of matter.*

A composition consisting solely of comminuted mica (in flakes or scales) and silicate of soda.

414,208—November 5, 1889. P. E. GONON. *Composition of matter for moldings.*

It consists, essentially, of a mixture of dry fibrous or cellulose material treated with coloring matter, with one-third pulverized soapstone, and an adhesive material composed of one-third glue and two-thirds starch; 20 to 30 grains of the binding material is used for 500 grains of the pulp and coloring matter.

414,209—November 5, 1889. P. E. GONON. *Composition of matter for moldings.*

It consists of fibrous or cellular material, soapstone, an adhesive material composed of glue and starch, and bronze powders.

415,648—November 26, 1889. S. H. GILSON. *Composition for overhead insulators.*

A compound of gilsonite, 20 parts; granulated material, as sand, 74 parts; and petroleum-still wax, 6 parts.

415,962—November 26, 1889. O. A. ENHOLM. *Composition for lining electric-battery jars.*

It consists of mineral wax, say, 50 per cent; sulphur, 25 per cent; ground glass, 15 per cent; and resin, 10 per cent.

418,947—January 7, 1890. A. HART. *Crayon.*

Composed of a pigment and carnauba wax, 1 pound; stearic acid, 1 pound; and paraffine wax, $1\frac{1}{4}$ pounds.

425,615—April 15, 1890. A. A. KNUDSON. *Insulating compound.*

A plastic compound of substantially equal proportions of carbolic acid and shellac, or like material, capable of being brought to a viscous condition.

426,202—April 22, 1890. J. F. MUNSIE.[1] *Insulating compound.*

A composition consisting of paper pulp treated so as to be noninflammable, fire clay, Portland cement, and a noninflammable agglutinating or binding agent, as white glue and silicate of soda. Molded articles after drying are immersed in a hot bath of india rubber or fireproof paint.

427,167—May 6, 1890. N. C. FOWLER. *Heat-insulating compound.*

The base consists of sifted or lixiviated ashes (or carbonate of magnesia, diatomaceous earth, or clay) and carbonate of calcium, with which may be incorporated finely fiberized fiber, lampblack, and pumice stone.

431,646—July 8, 1890. W. A. BURROWS. *Composition for the soles of boots and shoes.*

Leather waste reduced to flock is mixed with an aqueous solution of gelatine, to which not more than one-tenth per cent of chrome alum has been added to render the mixture nonabsorbent of water when dry.

431,743—July 8, 1890. C. R. GOODWIN. *Composition for porous carbon structures.*

A composition of finely divided gas or other hard carbon, with agglomerants forming moldable paste and with organic matter of cellular or fibrous structure that when baked will form a highly porous structure.

433,215—July 29, 1890. I. RABINOWICZ. *Insulating compound.*

A composition of 70 pounds of palm starine pitch, 40 pounds of gilsonite, 9 pounds of potassium bitartrate, and 2 pounds of tartaric acid.

436,733—September 16, 1890. J. W. EASTON. *Insulating material.*

Powdered soapstone, from 60 to 70 per cent, is mixed with fibrous material, as jute, and waterproofing material, as paraffine.

438,311—October 14, 1890. O. A. ENHOLM. *Composition of matter for making cells or retaining-vessels.*

A mixture of asbestus fibers, say, 40 parts; mineral wax, 30 parts; gutta-percha, 30 parts; and shellac, 10 parts.

438,698—October 28, 1890. A. E. MENUEZ. *Insulating compound.*

A composition of equal parts, by measure, of powdered mineral wool, powdered graphite or a hardening clay, and asbestus fiber, with liquid silicate of soda to form a thick paste. The graphite may be omitted.

439,526—October 21, 1890. O. KLETTE. *Composition for paper stucco.*

Vegetable pulp is impregnated with glue, plaster or whiting, siccative, sulphuric acid, and linseed oil. A finished stamped piece is covered with silk, by applying a coat of gelatine and affixing the silk, first steamed, by pressure under heat.

439,796—November 4, 1890. T. D. BOTTOME. *Insulating composition.*

Finely powdered silicon dioxide is mixed into a stiff paste with a solution of orthosilicic acid.

440,391—November 11, 1890. F. E. BLAISDELL. *Insulating composition.*

Seventy-two parts of asbestos and 18 parts of plastic clay, mixed dry, are mixed with a flux, as of feldspar and borax.

444,775—January 13, 1891. A. & S. DU PONT. *Process of manufacturing artificial ivory.*

Hydrate of lime is treated with an aqueous solution of phosphoric acid to form phosphate of lime; there is then mixed therewith carbonate of lime, magnesia, alumina precipitate, gelatine, and albumen. The mass is desiccated and subjected to great pressure until solidified.

445,111—January 20, 1891. J. GROTE. *Composition for treating articles made from paper.*

A composition comprising starch, water glass, and a fatty substance, such as beeswax.

446,502—February 17, 1891. E. G. WRIGHT. *Composition of matter for cable-filling.*

A mixture of crude petroleum, 1 pound 7¾ ounces; tallow, 1 pound 10 ounces; gypsum, 8 ounces; whiting, 3 ounces; pine tar, 2 pounds; and paraffin wax, 1 pound.

447,412—March 3, 1891. J. S. PALMER. *Composition of plastic material.*

A mixture of stearine, bitumin, wood-flour, and ground fiber, with or without whiting, or pigment, or coloring substance.

452,182—May 12, 1891. F. C. GOODALL. *Marine cement.*

A mixture of 40 parts by weight of hard asphaltum, 40 parts of liquid asphaltum, 8 parts of boiled or other siccative oil, and 12 parts of finely ground cork.

452,763—May 19, 1891. F. SALATHÈ. *Composition of matter.*

It consists essentially of pulp or fibrous material and a certain resinoid hydrocarbon of the $C_{10}H_{16}$ series.

452,869—May 26, 1891. G. W. TOOKER. *Artificial ivory.*

A compound of albumen, bone-ash powder, and talc, with fibrous material when it is desired to show a grain.

454,547—June 23, 1891. A. W. SPERRY. *Insulating material.*

A compound of, say, 3 parts of mineral wool, 6 parts of liquid silicate of soda, and 1 part of zinc white.

460,249—September 29, 1891. R. F. FLYNN. *Floor covering.*

A base of palm-oil pitch with the addition of coarse granules of cork is applied to a textile backing.

461,467—October 20, 1891. M. O. FARRAR AND C. C. HOWE. *Composition of matter for insulating purposes.*

It consists of silica, 434.7 to 478.4 parts; alumina, 297.6 to 362.3 parts; peroxide of iron, 13.4 to 88 parts; magnesia, 3.7 to 21 parts; lime, 2.9 to 13.8 parts; soda, 3.2 to 41 parts; potash, 55.1 to 124.4 parts; water, 14.5 to 62.2 parts; asphaltum, 50 to 75 per cent; mixed with the aid of heat and molded under pressure.

464,367—December 1, 1891. S. W. KIMBLE. *Insulating composition.*

It consists of pulverized mica, say, 40 parts; a mineral substance, such as talc free from lime, 40 parts; and silicate of soda, 3 parts; combined and molded under pressure.

464,369—December 1, 1891. S. W. KIMBLE. *Composition of matter for insulating purposes, etc.*

A mixture of pulverized mica, say, 50 parts; a mineral substance, such as asbestos or feldspar, 50 parts; soluble glass, from 3 to 10 parts; and sulphur or sulphur compound, as iron or copper pyrites, 2 parts; molded under high pressure without heat.

471,433—March 22, 1892. G. SCHWARZWALD. *Composition of matter for pencils or crayons.*

It consists of 100 ounces of paraffin wax, 2 to 10 ounces of dammar gum, 2 ounces of bichromate of potassium, 100 ounces of bronze powder, and 25 ounces of naphthol.

472,352—April 5, 1892. I. HILL. *Compound for insulating electric wires.*

A mixture of 1 pound each of pittizite pitch, candle tar, and coal tar, and one-half pound each of asphalt pitch and resin.

474,865—May 17, 1892. P. VON SLAMA. *Composition for use as ornamental moldings, etc.*

It is composed of dextrine, sulphate of lime, silicate of soda, and vegetable fibers; 10 parts of soluble glass is mixed with a 40 per cent solution of dextrine in water, 40 to 60 parts of sulphate of lime added, and vegetable fibers worked in.

479,967—August 2, 1892. R. G. DE VASSON. *Plastic composition.*

It consists of 1 to 2 volumes of fragments or powder of cork, and 2 to 1 volumes of an agglutinant composed of plaster of paris, dextrine, and sesquioxide of iron, with an oxychloride, such as the oxychloride of zinc, when it is to be used in damp places.

480,094—August 2, 1892. S. D. HOFFMANN. *Composition for and method of making heads and limbs of dolls.*

A compound of 100 parts of glue and 25 parts each of glycerine, zinc oxide, and Japanese wax.

484,345—October 11, 1892. J. T. SMITH. *Process of treating cork.*

It is confined in a mold and subjected to heat under pressure, whereby the resinous matter is vaporized and the pieces are cemented and solidified.

490,641—January 31, 1893. M. H. DEVEY. *Insulating compound.*

A mixture of slag, 8 parts, and glass, 2 parts; ground fine, with a binding medium, as boiled linseed oil, driers, shellac, and paraffin, to form a paste.

495,581—April 18, 1893. W. P. EMERY. *Composition of matter for railroad ties, etc.*

A mixture of 479 parts of paper pulp, 10 parts of albumen, 5 parts of sour milk, 1 part of lime, and 5 parts of chloride of zinc.

503,425—August 15, 1893. J. W. KIDWELL. *Non-corrodible plastic composition.*

A mixture of titanic minerals or natural oxide of titanium (as from the phosphate ores of Nelson county, Va.), 8 parts; and asphaltum or like hydrocarbon, 2 parts. To render it extremely refractory it may be heated to about 1,400° C.

504,988—September 12, 1893. J. MELLINGER. *Method of manufacturing artificial wood.*

To a mixture of 150 pounds of fibrous material—as tan bark—and 15 pounds of slaked lime, there is added a solution formed of 1 pound of borax, 2 pounds of alum, one-half pound carbonate of potassium, one-half pound zinc sulphate, 3 pounds sodium chloride, and 1 pound of sodium bicarbonate, in water, with 30 pounds of liquid silicate of sodium and 25 pounds of lye of 35 per cent; the pulp is molded and subjected to pressure.

505,916—October 3, 1893. J. HOFFMAN. *Insulating compound and method of manufacturing the same.*

A compound of asbestos fiber with a binding material composed of asphaltum, beeswax, and shellac; produced by spraying the asbestos with a mixture of beeswax and asphaltum with a suitable solvent, as benzine; drying; then mixing powdered shellac, with or without albumen, with the mealy substance thus formed; and molding under heat and pressure.

507,678—October 31, 1893. J. J. FANNING. *Insulating compound.*

A mixture of 6 ounces plaster of paris, 5 ounces pulverized asbestos, 4 ounces dextrine, and 1 ounce of linseed or other oil.

508,107—November 7, 1893. H. HAYNES. *Insulating compound for printing-presses.*

A mixture of 1 gallon of machine oil, 1 quart of glycerine, three-quarters of an ounce of paraffine wax, and 2 ounces of castor oil; to be applied to the tympan sheet of the press.

514,015—February 6, 1894. J. L. MILLER AND W. T. CROSSE. *Composition of matter for making chalk engraving-plates.*

It consists of 2½ drams of silicate of soda, 4 drams of silicate of magnesia, one-half pound of French chalk, and 1 pound of barytes.

515,192—February 20, 1894. G. A. CANNOT. *Material for insulating electric wires.*

An insulating coating for electric wires consists of, first, a coating of bitumen; second, of peat fiber; third, of spermaceti; fourth, of tar; and, fifth, of peat fiber. The wire is passed through a guide, by which its surface is leveled and made uniform.

517,452—April 3, 1894. A. GENTZSCH. *Insulating compound.*

The volatile elements of the fossil resins ozokerite, asphalt, and amber are driven off by distillation, and the residuums are mixed in the proportion, say, of ozokerite, 50 parts; amber, 45 parts; and asphalt, 5 parts.

522,745—July 10, 1894. J. L. TRUSLOW, JR. *Insulating composition.*

It is composed of ground cork, 90 parts, infusorial earth, 5 parts, and a binder, binder, as resin, 5 parts.

523,582—July 24, 1894. C. KÖSTER. *Process of manufacturing veneers.*

Concentric layers of a plastic mass in contrasting colors are formed on a core, and then veneers are cut therefrom in a direction transverse to the length of the core. The composition consists of glue, glycerine, and fossil meal.

524,021—August 7, 1894. A. HAGELE. *Floor-cloth.*

A composition consisting of dried and ground leaves, and a binder, such as an oil, resin, and gum, applied to a textile backing.

528,744—November 6, 1894. O. STILES. *Insulating compound.*

A mixture of 6 parts of alcohol, 3 parts of shellac, 3 parts of asbestos, and 1 part each of mica and alum.

529,728—November 27, 1894. W. GRISCOM, JR. *Vulcanizable compound.*

It is composed of substantially equal parts of animal fat candle tar (a residual product from the distillation of animal fats, oils, etc.), and a hard or nearly hard residual product from petroleum distillation, and sulphur in proportions of from 2 to 8 per cent of the mass.

537,321—April 9, 1895. A. C. THOMPSON. *Insulating compound.*

A mixture of 1 gallon alcohol, 5 pounds of gum shellac, 6 pounds pulverized asbestos, 4 pounds pulverized French chalk, 1 pound balsam tolu gum, and 4 pounds ground mica.

538,614—April 30, 1895. J. W. KIDWELL. *Insulating material.*

A mixture of titanic mineral (see No. 503,425), asphaltum, and silicious material, say 5 per cent, such as rice hulls or other organic material rich in silicic acid.

551,588—December 17, 1895. H. R. KNOCH. *Artificial building-block.*

A mixture of 50 parts of paper pulp with 12 parts of peanut shells, 2 to 3 parts of gum-tragacanth, and 2 to 5 parts of dissolved caustic soda.

551,530—December 17, 1895. G. DOEBRICH. *Composition for hands and feet of dolls, etc.*

A mixture of glue, 1 pound; glycerine, one-fourth pound; saccharine material, one-half pound; flour, 1 tablespoonful; albumen and coloring matter.

552,269—December 31, 1895. W. L. WOODS. *Plastic composition and process of combining same.*

A composition consisting of silica, 60 parts; magnesia, 30 parts; sulphur, 60 parts; and mineral wax, 3 to 10 parts; produced by grinding the silica and magnesia to a powder and expelling the moisture therefrom, repeatedly melting the sulphur and the mineral wax and pouring them into cold water, remelting the sulphur and mineral wax at about 150° C., adding the silica and magnesia, and then gradually increasing the temperature to 260° C., and cooking until the sulphurous fumes are expelled.

559,376—May 5, 1896. A. GENTZSCH. *Composition for electric insulation and process of making same.*

A composition of shellac, 50 parts; resin, 50 parts; birch-tar oil, 5 parts; aniline oil, 5 parts; and anthracene, 20 parts; produced by treating the shellac and resin with repeated washings to dissolve out all soluble matter, then melting and boiling together, melting the anthracene, mixing in a molten state, and adding the aniline oil and birch-tar oil, which have been previously freed of water and matter soluble in water.

560,321—May 19, 1896. J. J. MURPHY. *Composition of matter for making and sealing joints between pipes, etc.*

A compound of flower of sulphur, 100 pounds; fine flint sand, 100 pounds; antimony, 2 pounds; lead, 9 pounds; bismuth, 1 pound; powdered glass, 10 pounds; and borax, 2 pounds.

586,683—September 29, 1896. L. HONIG. *Insulating compound.*

It consists of alcohol, 30 parts; gum shellac, 25 parts; wheat flour, 20 parts; powdered asbestos, 20 parts; glue, 2 parts; varnish, 2 parts; and glycerine, 1 part.

571,117—November 10, 1896. F. R. HALL. *Composition of matter.*

A mixture of 9 parts by weight of prepared pitch—roofing pitch which has been distilled until a portion of its oil has been driven off and the melting point raised to about 170° F.—5 parts of asbestos fiber, and 4 parts of gum kauri.

572,016—November 24, 1896. C. KÖSTER. *Composition of matter for manufacturing artificial veneers.*

It consists of 11 grams of sawdust, 14 grams zinc-white, 40 grams flour paste (from 4 grams of flour), 1 gram resin glue, 20 grams boiled linseed oil, and 10 grams grape sugar or like saccharine matter. (See No. 523,582.)

578,514—March 9, 1897. W. HOSKINS AND W. A. SPINKS. *Substitute for billiard chalk.*

A compound of normally white pulverized silica, with or without corundum, a binding agent, as glue, and a coloring agent.

594,888—December 7, 1897. A. MILLAR. *Process of obtaining useful products from silkworms.*

The large intestines of silkworms, when they have attained the maximum size and are about to begin spinning, are subjected to pressure, without preliminary treatment, and the gelatin product drawn into threads and dried.

595,776—December 21, 1897. H. D. HOLBROOK. *Sheet material of cork and mechanism for producing same.*

A flexible, elastic sheet consisting of a homogeneous body of granulated cork and elastic cement molded under pressure, with threads running through the body of the material, and with the cork protuberances removed by sandpapering or otherwise.

597,283—January 11, 1898. M. HOCQUET. *Method of producing plastic composition from cork, etc.*

A plastic composition consisting of cork impregnated with borax, a gelatinous substance, tannin, and bichromate of potash; produced by treating comminuted cork with a solution of borax, drying and then mixing with a solution consisting of gelatin, 40 parts; Dutch glue, 25 parts; glycerin, 15 parts; crystallized sugar, 16 parts; ammonia, 2 parts; and sulphur, 2 parts; with a tannin solution and potassium bichromate solution added.

597,806—January 25, 1898. H. MARANGOLO. *Compound for treating glass.*

A fluid compound composed of 40 per cent of alcohol, 40 per cent of glycerine, and 20 per cent of water. To impart luster and prevent formation of frost.

606,921—July, 5, 1898. G. B. FRALEY. *Composition of matter for electric heaters.*

A mixture of talc, say, 60 parts; silicate of soda, 20 parts; carbonate of soda, 10 parts; and water, 10 parts.

611,814—October 4, 1898. A. MILLAR. *Insoluble gelatine thread or filament.*

An insoluble thread or filament composed of gelatine: produced by dissolving the gelatine in hot water and adding the proper chemical substances, such as bicromate of potash, either directly or in the form of a solution. The mixed solution is then concentrated to a suitable degree of thickness and forced through nipples in the form of threads. The threads may be formed of simple gelatine and then hardened.

613,763—November 8, 1898. J. C. GRAFT. *Plastic compound.*

It is composed of 2 parts of shellac, 1 part of French chalk, 1 part rice flour, and a small part of beeswax.

615,000—November 29, 1898. S. R. THOMPSON. *Composition for pipe-joints or the like.*

A mixture of 12 parts of paris white (calcium carbonate), 5 parts of oxide of iron, 2½ parts of brick dust, and one-half part of plumbago, with boiled linseed-oil to form a stiff putty.

616,560—December 27, 1898. H. REDHEAD AND G. W. EMMERSON. *Composition for making tight joints.*

A mixture of cement, 50 parts; boiled oil, 20 parts; venetian red, 10 parts; litharge, 5 parts; and chalk 15 parts.

619,019—February 7, 1899. J. HAVERSTICK. *Composition for floor-coverings, etc.*

It consists of a base or filling of ground corn-cob with a binding material.

619,337—February 14, 1899. W. PAINTER. *Gluten compound.*

A compound of gluten and a ground or pulverized body material, produced by mixing gluten in the plastic state with pulverized cork, wood pulp, or other material—say in the proportions of 2 parts of gluten to 1 of cork—rolling or molding into form, and subjecting to heat, as a temperature of 120° C., for about ten hours.

619,338—February 14, 1899. W. PAINTER. *Gluten compound.*

Gluten in its plastic state is mixed with glycerine, and then with a body material—as gluten 65 per cent, glycerine 5 per cent, and ground cork 30 per cent—and the product subjected to heat—about 100° C. for seven hours.

621,807—March 28, 1899. B. FORD. *Insulating compound.*

A liquid insulating compound heavier than water, composed of a mixture of 2 parts by weight of asphalt and 1 part of paraffin oil.

625,345—May 23, 1899. A. MILLAR. *Insoluble thread or filament.*

A thread or filament composed of a proteid strand insoluble in water; produced by treating threads of albumen or casein or the material before it is formed into threads, with chromic acid, tannic acid, picric acid, etc.

625,894—May 30, 1899. J. J. NUGENT. *Composition for blackboards.*

It consists of slacked lime, 100 pounds; black stain, 25 pounds; ground quartz, of a plurality of grades, 39 pounds; plaster of paris, 40 pounds; cement, 18 pounds; and glue, 6 ounces.

626,479—June 6, 1899. P. C. BELL. *Elastic compound.*

A compound consisting of vegetable oil, 59 parts; flour of sulphur, 15 parts; liquid tar, 1 part; petroleum residue, 20 parts; and powdered talc, 5 parts; produced by heating the petroleum to 112° F., adding the talc and liquid tar, then gradually adding the vegetable oil while maintaining the same temperature, raising the temperature to 200° F., adding the sulphur, and finally raising the temperature to 340° F., and stirring the mass until viscid.

627,008—June 13, 1899. G. OLNEY. *Composition of matter.*

A mixture of sodium silicate, in a plastic or liquid state, say, 2 pounds; dry paper pulp, 4 ounces; and powdered glass, 8 ounces.

627,207—June 20, 1899. D. ROGERS. *Plastic material for manufacturing shuttles, bobbins, etc.*

A mixture of wool flock, resin, terra alba, china clay, Brits white, grated potatoes, aluminum, shellac, alcohol, and coloring matter in equal or varying proportions according to the hardness required.

627,367—June 20, 1899. H. TZSCHUCKE. *Translucent plastic compound.*

A composition prepared by forming a milk of chalk or gypsum and separate solutions of glue, alum, magnesium sulphate and coloring matter, mixing and stirring the same, then adding glycerine, oil, and alcohol, stirring, straining, or filtering, heating to near the boiling point, and cooling slowly.

629,600—July 25, 1899. R. PLATZ. *Composition of matter for molding purposes.*

A mixture of saw dust, 17 parts; pulverized chalk, 27 parts; and water-glass, 56 parts.

632,014—August 29, 1899. S. HACKELBERG. *Composition for protecting panes of glass.*

A mixture of water, 30 parts; glycerine, 60 parts; sugar, 9 parts; and cumarin, 1 part; to prevent the deposit of vapor and hoar frost.

636,367—November 7, 1899. A. P. TSCHIRNER. *Dental cement.*

A cement free from substances soluble in water, formed of phosphoric acid, ammonia, and metallic oxides, such as zinc, tin, and aluminum.

636,657—November 7, 1899. F. GATZSCHE. *Composition of matter for soles and heels of boots or shoes.*

A mixture of waste of paper manufactories, 4 to 5 pounds; asphaltum, 1 pound; resin, one-half pound; turpentine oil, one-fourth pound; peroxide of iron, 2 ounces; and tallow, one-fourth pound.

636,818—November 14, 1899. P. H. A. LEDER. *Packing.*

An elastic and compressible packing, consisting essentially of asbestos fibers, cellulose, and paraffine.

637,106—November 14, 1899. F. GATZSCHE. *Composition for making floor-cloth.*

A mixture of water, 7 gallons; glue, 1 pound; wax, one-fourth pound; plumbic ocher, one-fourth pound; linseed oil, one-half pound; and tungstic acid, 1 ounce; made at a temperature of 80° C.

638,003—November 28, 1899. T. H. BLACKNALL AND W. T. JORDAN. *Composition for blackboards.*

It consists of emery flour, about 3 per cent; pumice stone, 2 per cent; lampblack, 3 per cent; and chrome green, 1 per cent; mixed with an adhesive liquid, and incorporated with 91 per cent of paper stock.

642,319—January 30, 1900. F. GATZSCHE. *Composition for making artificial leather fabric.*

A mixture of glue, 1 part; wax, 1 part; oil, one-half part; turpentine, one-fourth part; and alcohol, one-half part.

643,251—February 13, 1900. G. McKAY. *Composition of matter for sealing purposes.*

It consists of 45 per cent of sulphur, 25 per cent of brick dust, 10 per cent of foundry sand, 2 per cent of tin, 2 per cent of lead, 2 per cent of bismuth, 4 per cent of plaster of paris, 5 per cent of iron filings, and 5 per cent of borax.

643,989—February 20, 1900. F. SEHR. *Manufacture of cement.*

It consists of 50 per cent of powdered hard porcelain, 35 per cent half-burnt porcelain, 15 per cent of raw feldspar, and water glass to form a paste.

647,764—April 17, 1900. O. H. SCHNEPPER. *Plastic compound.*

A composition consisting of a gelatin solution, calcium chloride, coloring matter, and ether. Adapted to be applied to glass and give the effect of stained glass, or as a backing for mirrors.

654,688—July 31, 1900. J. E. THORNTON AND C. F. S. ROTHWELL. *Substitute for celluloid, etc., and process of manufacturing same.*

A transparent substance consisting of a dissolved and hardened salt of aluminum and a fatty acid, as aluminum oleate treated with benzole.

645,689—July 31, 1900. J. E. THORNTON AND C. F. S. ROTHWELL. *Article applicable for various purposes, together with process of manufacturing same.*

A transparent substance consisting of a dissolved and hardened salt of zinc and a fatty acid, as zinc oleate treated with benzole.

656,252—August 21, 1900. F. G. KLEINSTEUBER. *Compound for dissolving resins.*

A compound to be used with solvents of resin, consisting of 3 parts of dammar dissolved in 5 parts of oil of turpentine, with a mixture of 50 parts of tung or wood oil, 23 parts of benzole, and 5 parts of oil of turpentine added thereto; a suitable proportion is added to the resin solvent, of benzole, alcohol, oil of turpentine, or the like.

663,572—December 11, 1900. S. HEIMANN. *Substitute for gutta-percha.*

A compound of finely-pulverized peat, resin-oil, say, equal parts, and about 2 per cent of amyl acetate.

PROCESSES.

2,048—April 16, 1841. S. GOODWIN. *Improvement in the mode of hardening manufactures of cement and rendering them impervious to moisture.*

Cement casts are rendered impervious to air, moisture, or decay by boiling in a mixture of oil and resin.

47,068 March 28, 1865. A. MEUCCI. *Improved process for removing mineral, gummy, and resinous substances from vegetable fibre.*

The material is treated, first, in a dry state with the gases produced by the action of nitromuriatic acid upon carbonate of lime and iron; second, in a wet state with the same substances; and third, with a caustic alkali, with or without oil.

61,267—January 15, 1867. A. T. SCHMIDT. *Improvement in the manufacture of paper and treatment of paper pulp.*

Paper, paper pulp, and textile fabrics of vegetable fiber are treated with a mixture of glycerine, oil of vitriol, and water, and subsequently with an alkaline bath, rendering them water proof and like parchment.

102,484—May 3, 1900. W. M. BRYANT. *Improvement in preparing the pith of corn stalks for use in the arts.*

Vegetable pith is compressed and then coated with tenacious material, such as cloth, paper, varnish, paint, etc.

103,199—May 17, 1870. S. KINGAN, administrator of J. Anderson, deceased. *Improvement in the manufacture of roofing-felt.*

Roofing sheets formed by saturating fibrous material with a mixture of purified asphaltum and oil, or tar, at or immediately before the felting operation.

113,454—April 4, 1871. A. T. SCHMIDT. *Improvement in treating paper and vegetable fibrous substances.*

Paper (sized or unsized), paper pulp, and other vegetable fabrics and substances are treated with a bath of the mother water of the chlorides of zinc, tin, calcium, magnesium, or aluminium, or either of them, with or without the admixture of carbonates and oxides or other substances, and washed with water or alkaline solution, to render them tough, impervious to water, and resistant to the action of acids and alkalis. To impart flexibility and softness the material is then treated with a solution of glycerine and water, or sugar and water. Layers of treated paper are combined with layers of vegetable cloth similarly treated for the manufacture of belting, packing, etc.; also with emery, powdered glass, sand, or other pulverized or granular metal or mineral for use in the arts.

114,880—May 16, 1871. T. TAYLOR. *Improvement in the treatment of paper and paper pulp.*

Paper is treated in a concentrated solution of chloride of zinc, followed by thorough washing.

120,380—October 31, 1871. D. W. HANNA. *Improvement in methods of utilizing the waste chloride of zinc in treating paper.*

After paper has been treated in a bath of the solution as per No. 113,454, it is washed in water until the amount of the liquor washed from the paper raises it to from 30° to 40° Baumé. The waste or surplus mother-water is then concentrated by boiling to from 65° to 75° Baumé, at which gravity it is used for treating paper.

166,475—August 10, 1875. W. F. NILES. *Improvement in processes of manufacturing articles from horn and hoof.*

Horn or hoof is powdered, mixed with boneblack, bolted or sifted, then slightly moistened and subjected to pressure in heated molds.

186,924—February 6, 1877. B. CARPLES AND J. M. KOEHLER. *Improvement in processes of treating animal bones and making artificial whalebones therefrom.*

Bones are boiled in an acid bath, to remove the earthy salts, then repeatedly washed in cold water, cut into shapes and sizes, and pressed until dry.

192,863—July 10, 1877. W. H. DIBBLE. *Improvement in processes of making composition articles.*

Either organic or inorganic, pulverized or granulated substances, as sawdust or clay or slate, are mixed with blood, as in equal quantities by weight, the mass heated, and then subjected to great pressure in heated molds, forming articles of great hardness.

193,322—July 24, 1877. W. COURTENAY. *Improvement in making hollow articles of vulcanized fiber.*

Tubular articles are formed from vulcanized fiber by partially dissolving the edges in chloride of zinc, forming the tube upon a mandrel, cementing the edges under heat and pressure, and wetting and shrinking upon a mold, or mandrel, to impart the desired contour while drying.

193,846—August 7, 1877. J. BLISS AND F. O. BADGER. *Improvement in processes of treating blood for forming ornamental articles.*

Blood alone is reduced to a dry and powdered condition and subjected to heat and pressure in molds or dies.

196,894—November 6, 1877. T. HANNA. *Improvement in the manufacture of water-proof vulcanized fiber.*

Vulcanized fiber having its substance rendered moisture proof is formed by submitting the article or the material to a bath of nitric acid or a mixture of nitric and sulphuric acids, or sulphuric acid and nitrate of potash, or the fumes arising in the manufacture of bisulphate of potash.

196,895—November 6, 1877. T. HANNA. *Improvement in the manufacture of vulcanized fiber.*

The waste or cleansing bath holding chloride of zinc in solution is utilized by submitting it to the action of chemical reagents, as by adding to it a solution of carbonate of soda, or any of the alkaline carbonates, carbonate of zinc being precipitated and sodium chloride remaining in solution.

197,088—November 13, 1877. J. F. BOYNTON. *Improvement in ornamentation of the surfaces of hard material.*

The surface of shell, bone, marble, or other hard substance is dried and then impregnated, to a greater or less depth, with one or more halogens, such as iodine or bromine.

210,617—December 10, 1878. W. J. LEWIS. *Improvement in the manufacture of buttons and other articles from vegetable ivory, etc.*

Vegetable ivory is pulverized and subjected to pressure in heated molds, with or without agglutinizing matter.

213,733—April 1, 1879. J. BLISS. *Improvement in the treatment of albumen for the production of molded articles.*

Vegetable or animal albumen is dried, pulverized, and sifted, and compressed in heated molds or dies.

217,418—July 8, 1879. G. H. SMITH. *Improvement in treatment of bone, vegetable ivory, etc.*

Bone, vegetable ivory, and other porous hard material is treated with a solution of gum or other converting agent—as a solution of gum in bisulphide of carbon or like volatile solvent—and the material then drained and the superfluous converting agents removed by volatile solvents, whereby the pores are filled with transparent or translucent material.

221,852—November 18, 1879. W. F. NILES. *Improvement in manufacturing buttons, etc.*

Paper pulp is dried; separated into a linty mass; saturated with albumen or gelatin; dried; broken up into small pieces or bunches, and subjected to great pressure in molds at a heat of 100° C. or upward.

224,036—February 3, 1880. W. F. NILES. *Process of manufacturing buttons and other articles from fibrous material and powdered hoof.*

Paper pulp is dried; separated into a linty mass; saturated with albumen or gelatin; broken into small pieces or bunches; mixed with dried powdered hoof, one-fourth part by weight, and molded with great pressure at a heat of 100° C. or upward.

225,556—March 16, 1880. J. BLISS AND F. O. BADGER. *Manufacture of buttons and other articles.*

Coarsely powdered hoof is moistened with a pigment, dried, mixed with dried blood, and finely ground, and subjected to high pressure in heated dies.

233,322—October 19, 1880. L. A. BRODE. *Manufacture of slabs or blocks from wood or paper pulp, or from sheets made from such pulp.*

Slabs or blocks are formed of pulp, treated with a solution of gum tragacanth or tragacanthin, and a paste formed of rye or wheaten flour, pitch powder litharge, alum, and gelatine, and submitted to heat and pressure.

233,885—November 2, 1880. W. H. SMITH. *Art of preparing waste vegetable products for use and transportation.*

Loose fibrous or granulated vegetable material, as sawdust, bran, etc., is heated to 65° to 150° C., to dry and soften the natural gums or resins, and then subjected to impact in molds.

237,497—February 8, 1881. A. R. DAVIS. *Method of making articles from waste amber.*

Amber is reduced to a plastic condition by the agency of solvents—as bisulphide of carbon—and then subjected to pressure under heat. Mottled or blotched amber is produced by molding together ground amber with large fragments.

239,776—April 5, 1881. W. T. HENLEY. *Mode of insulating electrical conductors.*

Submarine telegraph cables are insulated by first covering the wires with india rubber and then vulcanizing the same in ozocerite, paraffine, or similar hydrocarbon.

239,794, April 5, 1881. J. W. HYATT. *Manufacture of factitious material to imitate ivory.*

Articles are formed from an inert material, as zinc oxide, and an adhesive agent, as shellac, by mixing, say, 8 parts of powdered shellac with 32 parts of a solvent, as aqua ammonia, and 40 parts of zinc oxide, subjecting the mixture to the action of a mill, then desiccating the solid elements of the mixture with, in some cases, a second grinding in a dry state, and finally compressing and solidifying the powder in heated molds.

243,963—July 5, 1881. J. PATHE. *Method of treating horn shavings.*

Horn shavings are soaked in a solution of boracic acid and arsenious acid, first cold and then warm, and the swelled horn shavings are then heated up to 120° C., under pressure, and united into a solid mass.

244,170—July 12, 1881. S. BARR. *Manufacture of gas tubing.*

Bichromated oil varnish is applied to the surface of a glue and glycerine compound to render the same indestructible by heat and insoluble in water.

247,477—September 27, 1881. W. V. BRIGHAM. *Art or method of making ornamented or variegated gelatinous sheets to imitate tortoise shell, etc.*

A solution of gelatine, suitably colored, is flowed upon glass, and sprinkled with a second solution of gelatine or analagous substance, suitably colored or prepared, while liquid or semiliquid, which solutions are then mingled or blended. The film is backed by covering it with paper or cloth, which is permitted to dry thereon, the film being detached from the glass after drying.

256,043—April 4, 1882. C. POPPENHUSEN. *Molding articles of india-rubber and other vulcanizable gums.*

The mold is filled with a liquid, as linseed oil, to exclude all air therefrom, and the liquid is then displaced by pressing the compound into the mold so filled.

256,872—April 25, 1882. F. BODINE. *Method of treating pulp and the resultant material.*

Vegetable pulp is saturated with linseed or other vegetable or drying oil, and rolled, pressed, or molded, with or without coloring material.

257,607—May 9, 1882. A. PARKES. *Treatment of cellulose and the manufacture of articles therefrom.*

In the manufacture of articles of cellulose, or coating therewith, the cellulose is dissolved in a solution of iodide or nitrate of zinc or nitrate of lime, molded to the form required; the solvent then removed by washing and treating with an alcoholic or vegetable naphtha solution, and the article rolled, pressed, or calendered.

259,271—June 6, 1882. J. A. FLEMING. *Preparation of materials for use in electric insulation.*

Finely pulverized wood, desiccated, is saturated or impregnated with paraffine wax or with a mixture of wax and resin, and molded under pressure.

268,034—November 28, 1882. M. MACKAY. *Manufacture of insulating compounds.*

A mixture of mineral wax, such as paraffine wax or ozocerite-wax, 1 part; vegetable tar, 24 parts; and shellac and asbestos or other dry fibrous substance, 32 parts of each. Ground slate or silica or clay free from iron is sometimes employed in place of wax.

279,384—June 12, 1883. C. HEMJE AND T. C. BRECHT. *Machine for compressing plastic and other material.*

The materials are subjected to a bath of a sprayed fluid and then to compression.

284,289—September 4, 1883. J. A. FLEMING. *Preparation or production of insulating materials or articles.*

Finely pulverized wood, desiccated, is impregnated, under pressure, with a mixture of melted bitumen or asphalt incorporated with a substance of the resin type, and with or without a substance of the paraffin type or of the anthracene type, or of both paraffin and anthracene types.

288,300—November 13, 1883. B. BOROWSKY. *Method of uniting small pieces of amber into a large block.*

The pieces of amber are hermetically closed in a receptacle, subjected to a light pressure, heated to a high degree of heat, about 500° C., a strong pressure then applied, and finally it is slowly cooled.

297,639—April 29, 1884. R. SCHIMMEL. *Process of manufacturing chair-seats of vegetable fiber and chromic acid.*

Ground rags and vegetable fiber, in equal parts, are mixed and formed into a paste with the addition of chromic acid, 3 parts to 100 parts of water; formed into sheets; backed with textile fabric; molded and pressed; varnished and dried.

301,405—July 1, 1884. F. THIEMER. *Method of producing molded articles from substances containing ligneous fibers.*

Molded articles are produced from sawdust, wood shavings, wood pulp, straw, etc., by treatment with chloride of zinc and basic chloride of magnesium, compression into molds, and drying.

302,795—July 29, 1884. F. TAYLOR. *Method of treating vulcanized fiber and like material.*

To impart softness and flexibility to vulcanized fiber, the fiber, after the organic change has been produced, is subjected to the action of a solution of deliquescent salt, as chloride of zinc, with or without glycerine or sugar water combined therewith.

317,387—May 5, 1885. C. S. LOCKWOOD AND J. W. HYATT. *Process of treating alkaline silicates, etc.*

Articles are formed of an alkaline silicate with or without an inert material, by forming a solution of the silicate, and introducing, if preferred, the inert material, desiccating the solution, comminuting the compound, and subjecting the powder to pressure in heated molds, with or without subsequent treatment in a bath.

317,390—May 5, 1885. C. S. LOCKWOOD, J. W. HYATT, AND J. H. STEVENS. *Process of treating gelatine when combined with tannic acid, etc.*

One hundred parts of gelatine, say, are combined with 5 to 10 parts of tannic acid, the compound dried and comminuted, and the desiccated powder subjected to pressure in heated molds.

326,220—September 15, 1885. A. H. HUTH. *Manufacture of compounds of india-rubber, gutta-percha, and like materials.*

Earth wax and gums and resins are fused and maintained in a state of fusion until all matters volatile at the fusing temperature are expelled, then cooled, powdered and mixed with india rubber, gutta-percha, or analogous substances.

330,019—November 10, 1885. A. HAMANN. *Process of rendering billiard and writing chalk unbreakable.*

Cubes or pieces of chalk are saturated with fluid-oil varnish or boiled linseed oil or other drying oil.

343,590—June 15, 1886. O. LUGO. *Producing solid compounds resembling vulcanite from hair, etc.*

Hair is subjected to heat and pressure.

349,760—September 28, 1886. E. C. C. STANFORD. *Algin and other useful products.*

Seaweed is mixed with a solution of carbonate of soda and boiled to produce a cellulose residue; the solution is treated with sulphuric acid, or hydrochloric acid may be used, producing alginic acid as a precipitate; the remaining solution is neutralized with alkaline earth, producing a precipitate of sulphate of lime; the remaining solution is evaporated to a density at which sulphate of soda crystallizes out as Glauber's salts; and the mother liquor is finally evaporated to dryness and the residue carbonized, forming kelp substitute.

355,998—January 11, 1887. M. KAMAK. *Treating horn.*

Horn is subjected to the action of a solution of water, sugar of lead, and vinegar until it assumes a light brown hue. To give it the appearance of mother-of-pearl it is then introduced into a solution of muriatic acid.

359,156—March 8, 1887. C. JACKSON. *Manufacture of hardened asbestos.*

Fibrous asbestos is combined with a binding material, as shellac, rendered liquid in a solvent; the solvent is evaporated; the material pressed in molds; exposed to heat to perish the binding material or change it so that it is no longer soluble in the solvent; when the article is simultaneously subjected to heat and heavy pressure.

366,341—July 12, 1887. H. W. MORROW. *Method of treating vulcanized fiber.*

To impart softness and flexibility to vulcanized fiber, the fiber, after the organic change has been produced, is subjected to the action of a solution of deliquescent salt, as chloride of calcium, with or without glycerine or sugar water combined therewith. (See 302,795.)

370,645—September 27, 1887. H. ORDENSTEIN. *Manufacture of articles from plaster-of-paris or other compositions or materials.*

A formed article of plaster of paris or other porous material is treated with carnaub-wax to fill the pores and strengthen and harden and give a polishable surface.

371,550—October 18, 1887. E. T. L. CLARK. *Process of hardening and preserving plaster-of-paris casts and molds, and making them impervious to water.*

The casts or molds are immersed in a solution of borax and then treated with white or paraffine wax.

389,210—September 11, 1888. C. A. FAURE. *Method of preparing asbestos.*

A sheet of asbestos is immersed in a soluble salt, as chloride of calcium or chloride of barium, dried, and again immersed in a second solution containing a silicate, such as the silicate of soda or a fluosilicate, whereby it is rendered insoluble in water and acid and its strength is increased.

395,083—December 25, 1888. W. SIEMENS. *Process of manufacturing insulated conductors.*

The fibrous matter covering wire strands is impregnated with caoutchouc, oil, or similar liquid, by drying the covered wires under vacuum by means of sulphuric acid or other hygroscopic substance, and then admitting the heated caoutchouc, oil, or other substance into the vacuum chamber containing the wire.

405,201—June 11, 1889. B. E. CHURCH. *Process of treating asbestos.*

Broken asbestos is mixed with a solution of rubber and naphtha which has been mechanically distended by water—as by mechanically mixing a solution of rubber in naphtha with water—then the water is removed by pressure, and the mass is formed into shape by heat and pressure; the asbestos may be soaked with water and the india-rubber solution then mixed therewith.

410,042—August 27, 1889. J. L. STEWART AND J. L. HASTINGS. *Process of producing refractory compounds.*

A refractory crystalline compound for incandescent illumination is produced by pulverizing and mixing a strontium compound or salt with one or more pulverized mineral substances and with a flux composed of a fluoride or a fluorine compound, making the mixture plastic and molding it into shape, then subjecting the molded material to a moderate drying heat, and finally to a high temperature.

419,779—January 21, 1890. G. KOLLER. *Process of treating glue and gelatine molds.*

Glue or gelatine molds are treated with strong oxidizers, as an aqueous solution of anhydrous chromic acid, and afterwards exposed to light; or the glue may be dissolved in an aqueous solution of an energetic oxidizer, the mold formed, and afterwards exposed to the action of light.

420,763—February 4, 1890. W. BOOTH. *Art of manufacturing articles from wood pulp.*

Wood pulp is reground, after it has been subjected to the indurating pickle and dried, and the ground product is then compressed into the desired form.

422,760—March 4, 1890. R. P. FIRST. *Article of chemically treated fibrous material and mode of making the same.*

Shaped articles composed of laminated forms of chemically treated fibrous material are produced by producing a laminated body from a chemically treated sheet of fiber, and then subjecting these laminæ to endwise pressure, whereby they are swaged into the desired form.

428,925—May 27, 1890. I. W. MARSHALL. *Process of treating fibrous material.*

In washing sheets of fibrous material which have been treated with acids, the sheets are confined under pressure between plates having corrugated faces with or without perforations.

429,999—June 10, 1890. C. A. CATLIN. *Plastic composition.*

A fibrous material is combined with a cementing agent in a pulverulent state by mixing the substances together with water and after a thorough mixture, removing the surplus moisture, and compacting with heat and pressure.

437,044—September 23, 1890. F. L. RAWSON. *Method of impregnating parts of electrical apparatuses.*

Hollowed or cored insulating parts of electrical apparatus formed of hydraulic cement are impregnated with heavy, oily, or resinous matter, by means of a closed, heated vessel placed with the molded article with the impregnating matter around it.

438,309—October 14, 1890. T. A. EDISON. *Method of insulating electrical conductors.*

Balata or similar gum is prepared for insulating purposes by dissolving in a solvent of chloroform and passing chlorine gas through the solution until the hydrogen of the material is sufficiently replaced by the halogen. if the chlorination is carried so far that the material is brittle, a small quantity of the gum solution not chlorinated is mixed therewith.

441,870—December 2, 1890. E. T. GREENFIELD AND J. NAGEL. *Process of working high-boiling hydrocarbons for impregnating purposes.*

For impregnating fibrous, porous, or cellular bodies, a high-boiling hydrocarbon is maintained in a liquid condition by adding from time to time a lower-boiling hydrocarbon to supply the volatile matters evaporated.

441,951—December 2, 1890. G. W. GOETZ. *Process of and apparatus for comminuting materials of a viscous or pasty nature.*

Material of a viscous, pasty, or gummy nature is comminuted by subjecting it to motion and attrition in a closed receptacle under a reduced temperature, where the material becomes friable.

445,285—January 27, 1891. F. EGGE. *Method of molding amber.*

Pieces of amber are molded into an integral article by the application of heat and an automatic pressure constantly and uniformly applied; as by the action of a weight applied through a lever.

460,056—September 22, 1891. E. FAHRIG. *Process of manufacturing a composition applicable for electrical insulating purposes, etc.*

Properly prepared pulp—cellulose or linen pulp—is beaten up with manila fiber; then there is added a soap solution and the mass is treated with a precipitate until precipitation shows in the whole mass; the pulp formed into sheets; powdered with an insulating powder; subjected to pressure and dried; treated with an insulating solution; and again subjected to heavy pressure.

468,222—February 2, 1892. H. B. GARRIGUES. *Process of molding plastic material.*

Plastic material is packed in foil by introducing the material into molds of thin foil while the latter are suspended in open-mouthed pockets, reducing the diameter of the article by means of cold, and afterwards closing the open ends of the molds by turning the edge of a blank over the end of the core and mold.

483,646—October 4, 1892. A. H. S. DYER. *Process of making artificial mica sheets for electrical insulation.*

Overlapping mica scales are laid on a freshly varnished foundation plate, the sheet is varnished, and additional layers of mica are laid in a similar manner until the required thickness is obtained, when the sheet is heated to evaporate the solvent of the varnish, rolled, submitted to heavy pressure, and cooled.

483,653—October 4, 1892. C. W. JEFFERSON. *Molding mica forms for electrical insulators.*

Laminated mica sheets are formed and set by cementing together laminæ of mica scales with overlapping edges, compressing the sheet into the desired form while the cement is wet, drying the cement by evaporating the solvent thereof, and chilling while under compression.

492,056—February 21, 1893. M. SICHEL. *Method of producing dental cement.*

Metallic aluminum is first dissolved in glacial phosphoric acid to produce a phosphate of aluminum; next oxide of zinc is subjected to a white heat to reduce it to a gummy condition, the two are mixed and the compound subjected to heat, then cooled and pulverized, more of the gummy oxide added, and the whole mixed in a powdered condition; and finally, when ready for use, sufficient of the said phosphate of aluminum is added to reduce the whole to a plastic condition.

494,891—April 4, 1893. R. REIMAN. *Process of manufacturing artificial bone.*

Natural bone or bone meal is chemically dissolved, the elements precipitated, filtered, and washed, and then mixed with albumen, alumina sulphate, and cellulose in solution, and subsequently partly dried and subjected to a high temperature, at the same time keeping the mass under strong pressure.

497,324—May 16, 1893. C. W. JEFFERSON. *Process of making mica insulating plates.*

Mica sheets are distributed evenly upon and within liquid cement by showering them thereon through the air at a sufficient height so that the sheets become substantially parallel to a horizontal plane before reaching the cement—say 18 feet—and the excess of cement is then expelled by pressure, the plates dried, and the surface ground until parallel; successive showerings of mica sheets are made into the cement, iron foundation sheets being introduced between the showerings, and the mass divided up into separate parts.

501,222—July 11, 1893 P. C. DAME AND L. PRUD'HON. *Method of making artificial whalebone.*

Animal hair is subjected to a softening bath, as of lime and potash, then immersed in a bath of acetic acid, and finally subjected to pressure.

508,653—November 14, 1893. E. THOMSON. *Insulating composition.*

Silicious or like material, as fine kaolin and soluble silicate of soda, is applied to sheets of paper, the sheets piled together and dried; they may be baked and the paper carbonized, with layers formed of more or less vitrified silicious material.

517,011—March 20, 1894. J. C. PEABODY. *Method of making indurated articles from plastic material.*

Wood fiber or paper stock in dry condition is mixed in the presence of heat with linseed oil and resin, and then powerfully compressed, while still warm and plastic, in cold molds.

520,283—May 22, 1894. K. WITZ. *Manufacture of plastic articles.*

Paper board or like material is impregnated with hellebore juice to increase its elasticity and tenacity, prior to subjection to pressure between dies.

522,242—July 3, 1894. A. F. TINNERHOLM AND C. F. PETERSON. *Process of manufacturing insulating material.*

Mica plates are built up by forming superposed layers of mica scales covered with finely powdered gum or resin, and subjecting the combined layers to heat and pressure.

529,905—November 27, 1894. W. GRISCOM, JR. *Method of compounding vulcanizable compounds, and vulcanizing and applying same.*

Vulcanizable compounds containing such plastic material as candle tar are compounded by heating the plastic matter to a melted condition, separately melting the sulphur, and then mixing the melted masses; the compound is then applied in permanent adherence to fabricated material.

530,517—December 11, 1894. A. N. FORD. *Process of manufacturing insulating compositions for electrical purposes.*

Fibrous material is saturated with a partially oxidized drying oil, then dried, and then repeatedly saturated or coated and dried until the mass has increased in weight from 50 to 200 per cent; when the material is ground to a homogeneous mass, mixed with gutta-percha or like material, reground, and formed into blocks or sheets.

530,958—December 18, 1894. B. MCCABE AND A. THAYER. *Method of molding vegetable fibrous material.*

Vegetable fibrous material is first treated with acid, then forced through apertures in a head, whereby it is formed into strips or strings, which are deposited in a plastic condition in a mold, compressed, and finally immersed in water.

533,746—February 5, 1895. R. REIMAN. *Process of manufacturing artificial bone.*

Natural bone is macerated, the liquid separated from the organic solids, the gelatine separated from the residue of the organic matter, and the gelatine product is then combined with a chromate and a drying oil, and a material that will give body to the composition.

538,265—April 30, 1895. H. P. LANE AND E. FOLK. *Process of making molded articles from wood pulp.*

The article is molded of wood pulp, then impregnated with oil and resin, baked, and then subjected to heavy pressure between smooth mold surfaces, warmed sufficiently to soften the coating, but not the material.

539,928—May 28, 1895. J. A. WHEELER. *Process of molding fibrous pulp.*

Fibrous pulp, moistened with water, is mixed with sodium silicate, and then with pulverized calcined magnesite sufficient to convert it into a doughy body; then with pulverized quicklime; then pulverized resins or gums are added, and the mass heated and molded, dried or baked, and subjected to a bath of a solution of chloride of magnesia or other chlorides.

549,254—November 5, 1895. C. F. PETERSON. *Method of making insulator-rings.*

In forming flanged insulator rings of built-up pieces of mica, the pieces of mica are bent and assembled to form the predetermined ring and cemented together as the irregular structure is built up; the structure is then subjected to pressure and heat in a mold, and chilled.

561,938—June 9, 1896. T. G. B. GOLDMANN. *Process of making articles from homogeneous plastic compositions.*

A binding substance is dissolved in a water-soluble solvent, such as alcohol; then mixed with a filling material and pigment in finely divided state, in proportion to their specific weights in dry state; next water is added to the mixture under continuous stirring until the intimately mixed mass of binding substance and filling material is separated from the solvent and precipitated as a thick paste; when the water is removed, the paste dried, pulverized, and compressed while subjected to heat.

574,793—January 5, 1897. A. N. FORD. *Art of making oil fabrics.*

Fibers are loosely separated and repeatedly immersed in boiling oil so as to coat the separate fibers; the oil oxidized after each immersion by the action of air, with the fibers maintained in their loosely separated condition, and the coated fibers finally ground to form a homogeneous mass.

589,256—August 31, 1897. J. GRAY AND C. H. CASE. *Process of making insulating material.*

Pulp is formed into shape, heated in a bath of molten sulphur, then subjected to heat under pressure, and subsequently immersed in a cold bath.

589,637—September 7, 1897. W. G. BRISTOW. *Method of and means for molding plastic material.*

A partial vacuum is created beneath a flexible tissue placed over a pattern, the plastic material is then cast within the tissue thus drawn into the mold; hardened; and the pressure is then restored beneath the tissue, forcing it from the pattern and releasing the cast from the tissue.

595,168—December 7, 1897. L. GROTE. *Process of manufacturing moldable mass or articles from asbestos.*

Asbestos is steeped in a bath composed of a solution of 1 part of glue, 6 parts of a solution of soluble glass of 20° to 30° Baumé, and 7 to 9 parts of a solution of 40 per cent formaldehyde; it is then compressed to remove superfluous moisture, subjected to a bath of a salt of alumina, dried, pulverized, compressed, and then dried first in the open air and then in an oven.

618,692—January 31, 1899. F. LAMPLOUGH. *Process of manufacturing a substance having insulating properties.*

Vegetable fiber is submitted in presence of oxidizable resinous bodies and a proportion of nonoxidizable oil to a gradually-increasing heat until all air, dampness, and volatile matters are driven off; the action of the heat is continued until the nonoxidizable oil is destroyed and until the vegetable fiber is changed into a homogeneous mass, when the fluid portion is removed, air is introduced under pressure to oxidize the material, and it is pressed and desiccated.

622,325—April 4, 1899. H. BRUNSWIG. *Method of transforming fibrous cellulose into a dense material.*

Fibrous cellulose is reduced to an impalpable condition in water, the water drained from the mass, with or without boiling to expel the air, and molded and dried.

623,608—April 25, 1899. C. IVES. *Process of treating gelatin, glycerin, and bichromate of potash.*

A substance of rubber or gutta-percha like character is produced from a composition of gelatine, glycerine, and bichromate of potash, with which adulterating material may be combined, by mixing the ingredients in as nearly an anhydrous state as possible, whereby chemical action between the bichromate of potash and gelatine is sufficiently inactive to allow time for molding the composition under pressure, and heating it while under pressure to 95° to 150° C.

625,372—May 23, 1899. J. A. WHEELER. *Process of molding fibrous pulp.*

To give more body and increase the solidity, fibrous pulp is mixed with pulverized incombustible material; moistened with hot water; sodium silicate added, the mass kneaded, and quicklime added thereto; and pulverized resins are mixed with the mass while heated, with or without the subsequent addition of calcined pulverized magnesite soaked in chloride of magnesia.

625,450—May 23, 1899. J. KAISER. *Process of manufacturing materials similar to wood from fibrous refuse.*

Fibrous refuse is fluxed with lye, then saponified with resin, and subjected to pressure, when ground wood and an agglutinant, as grape sugar, is mixed with the said material and the mixture dried and kneaded.

631,719—August 22, 1899. A. IMSCHENETZKY. *Refractory material.*

The process of forming refractory material consisting of asbestos, with or without the admixture of other material, bound together by means of silica, consists in first saturating articles of asbestos with a solution of sodium silicate mixed with sodium bicarbonate, then saturating the same first with a sodium-silicate solution, and then with a sodium-bicarbonate solution.

640,725—January 2, 1900. P. W. WIERDSMA AND J. KUIPERS. *Process of treating vegetable waste.*

Vegetable waste—produced in the manufacture of potato flour—is treated for the removal of dirt and matters soluble in water; then dried and disintegrated; mixed with resin or other gum to render the mass waterproof; dried; reduced to a powder; and molded under pressure.

643,012—February 6, 1900. A. SMITH. *Process of producing material suitable for electric insulation or other purposes.*

Two parts (by measure) of acetic paraldehyde and 1 part of methylated spirit are mixed; 3 parts of liquid carbolic acid, which has been liquified by adding 5 per cent of water, added: and to the mixture, in a closed vessel, there is added in small doses, while cooling, 3 to 6 parts of methylated spirit, which has been saturated with hydrochloric-acid gas; and the material is molded; the molded article may be impregnated with paraffin.

647,119—April 10, 1900. T. SEEHAUSEN. *Process of compounding fillings for rubber tires.*

Light ground vulcanized rubber is mixed with resin oil, heated for two hours at a pressure of 45 pounds per square inch; then there is added a second mixture of ground vulcanized patent rubber waste, which has first been washed in water and dried with loofah fibres, solar oil, and turpentine; and finally there is added to this mass a mixture of india rubber, sulphur, ammonia, soda, and neutral acetate of lead.

652,144—June 19, 1900. A. SKROBANEK. *Process of producing artificial wood.*

It is produced by cleaning and carding peat, separating the humic and ulmic acids as borates and silicates, mixing the peat-mull with a filler and a hardening material—such as a composition of silica, alumina, and sodium borate and silicate—forming alternate layers therewith and with the carded fiber laid in different directions, and molding the compound; the mull is treated with a hot solution of sulphuric acid and alum.

654,646—July 31, 1900. F. G. KLEINSTEUBER. *Method of dissolving resins.*

There is mixed with the resin solvent a suitable quantity—2 to 10 per cent of the resin—of a compound composed of a solution of dammar and tung or wood oil in benzole, and oil of turpentine with or without oil of rosemary.

654,951—July 31, 1900. W. J. CORDNER. *Process of manufacturing composition applicable for electric insulation.*

Rhea fiber is treated in a solution of silicate of soda of 15° to 20° Baumé, dried, saturated with a heavy hydrocarbon, such as resin oil and the like, the surplus heavy hydrocarbon removed, the saturated fiber treated with heat to transform it into a heavy hydrocarbon cellulose, which is disintegrated and mixed with gums, resins, oxidizable oils, and the like to form a composite material.

655,130—July 31, 1900. R. M. THOMPSON. *Method of treating wurtzilite.*

The mineral is subjected to the action of steam heat to reduce it to a softened or fused state.

655,131—July 31, 1900. R. M. THOMPSON. *Wurtzilite method and product.*

The mineral is softened, as by the action of heat, and combined with a hardening material, as mica, asbestos, or soapstone, and afterwards a quantity of sulphur.

657,818—September 11, 1900. M. FREMERY AND J. URBAN. *Manufacture of cellulose.*

Cellulose material, such as cellulose, hydrate of cellulose or hydrocellulose, is subjected to an energetic preliminary treatment with reducing or oxidizing bleaching media, such as sulphurous-acid salts or chlorine in the form of hypochlorite, and then subjected to the action of an ammoniacal solution of copper.

659,358—October 9, 1900. J. G. BIERICH. *Process of producing homogeneous horn substances.*

Horn cuttings and shavings are cleaned, mixed with glycerine, and the mixture subjected to a temperature of 100° C. for about forty minutes and at a pressure of about two hundred atmospheres, the process being carried on under exclusion of air.

662,929—December 4, 1900. W. GELINEK. *Process of manufacturing solid substances from fibrous material and product thereof.*

A composition of fibrous material, with coal tar, colophony, asbestos, kaolin, infusorial earth, and lime, compressed when hot in molds under high pressure.

GROUP XVI.—ESSENTIAL OILS.

ESSENTIAL OILS, PERFUMES, AND FLAVORS.

162,529—April 27, 1875. A. G. CAMPBELL. *Improvement in portable toilet waters and extracts.*

Fragrant attars are absorbed by carbonate of magnesia and then reduced to a powder, the same being adapted to readily produce toilet waters and extracts by lixiviation with alcohol. Thus, for cologne water, a mixture of 3 ounces of attar of bergamot, 2 drams of attar of neroli, and 1 dram of attar of rose is poured on 4 ounces of carbonate of magnesia.

200,168—February 12, 1878. D. M. BUIE. (*Reissue: 10,338—June 5, 1883.*) *Process of manufacturing oils from organic substances.*

Steam and carbonic acid are injected into the retort containing the materials, such as pitch pine, sassafras, juniper, myrtle, peanuts, cottonseed, etc., and heated to a high temperature.

330,274—November 10, 1885. A. M. TODD. (*Reissue: 10,705—March 30, 1886.*) *Process of obtaining menthol.*

A crystalline product is obtained from the oil of *mentha piperita* by congealing it to a jelly-like form and draining the oil therefrom; the crystals may be fused and subjected then to a second congealing and draining and a gradual raising in temperature.

556,944—March 24, 1896. J. C. W. F. TIEMANN. *Process of converting compounds of the citral series into isomers.*

Compounds of the citral (geranium) series are subjected for some time to the action of dilute sulphuric acid, producing isomers having a lower b. p. and a higher sp. gr. than the original bodies.

557,431—March 31, 1896. L. R. SCAMMEL. *Process of obtaining eucalyptol.*

A solution of phosphoric acid is added to the eucalyptus-oil or other volatile oil containing eucalyptol, and the eucalyptol phosphate formed is then decomposed by hot water.

588,766—August 24, 1897. M. EKENBERG. *Process of making perfumes.*

Perfumes, contained in closed vessels, have an inodorous hydrocarbon or ether added, as butane, having a boiling point below 30° C., to be readily vaporized at the temperature of the hand or the air of a living room.

600,429—March 8, 1898. E. DE LAIRE. *Ionone derivative.*

A new product, an isomerid of ionone, b. p. 140° C., of the odor of violets, is produced by treating ionone or pseudo-ionone with a concentrated condensing-acid, such as sulphuric acid.

601,193—March 22, 1898. J. ZIEGLER. *Essence of violets.*

Citral, or an oil containing citral, is treated in a mixture of acetone and diluted alcohol, with an active oxidizing agent, as a saturated solution of chloride of lime or barium peroxide, and the product further oxidized by boiling with ferric chloride.

617,552—January 10, 1899. P. BARBIER. *Synthetic violet-oil and process of making same.*

A new product, $C_{11}H_{24}O$, a yellowish oil, b. p. 162° C., under pressure of 10 m. m., is produced by condensing an aldehyde of the formula $C_{10}H_{16}O$, as citral, with methylpentenone (oxide of mesityl) under the influence of an alkaline reagent, and transforming the product into an isomeric ketone by the action of an acid condensing agent.

626,585—June 6, 1899. J. ZIEGLER. *Synthetic violet-oil and process of making same.*

A new product, b. p. 138° to 149° C., under pressure of 12 m. m. It is produced by heating a mixture of acetone, lemon-grass oil, alcohol, cobaltous nitrate, and chloride of lime; distilling off first the lighter and bad-smelling portions, then the essential oils, mixing these oils with sodium bisulphate and fractionally distilling.

637,209—November 14, 1899. I. KLIMONT. *Process of making ionone.*

Citral and acetylacetone in acid solution are heated with reagents adapted to combine with the water, and the oily matter is separated and purified.

650,028—May 22, 1900. J. C. W. F. TIEMANN. *Process of decomposing ionone.*

The ionone is boiled with an alkali sulphite in the presence of a binding agent for any liberated alkaline hydrate; the solution subjected to steam distillation; and alkali added to the remaining solution to liberate the alpha ionone.

ARTIFICIAL MUSK.

412,545—October 8, 1889. E. SCHNAUFER AND H. HUPFELD. *Process of making artificial musk.*

An oil having the formula $C_{12}H_{17}NO_2$, adapted for use as a substitute for musk, is made by digesting a mixture of metaxylol and isobuty alcohol with chloride of zinc, nitrating the resulting hydrocarbon, and separating the oil by dissolving out extraneous matter.

416,710—December 10, 1889. A. BAUR. *Process of making artificial musk.*

Toluol is mixed with butyl chloride; the product of the reaction diluted with water and distilled with steam; the vapors treated with a mixture of fuming nitric and sulphuric acid; and the product, a substitute for musk, crystallized from alcohol.

451,847—May 5, 1891. A. BAUR. *Artificial musk.*

A new product, being a trinitrated hydro carbon derived from toluene or its homologues, in solid crystalline form. It is made, for example, from toluene, or xylene mixed with a butyl halogen compound, distilled, treated with fuming nitric and sulphuric acid, and crystallized with alcohol.

481,685—August 30, 1892. A. BAUR. *Artificial musk and process of making the same.*

A new product, being a trinitro-derivative of the butylated or analogous metacresol in a white crystalline form, is produced by mixing an ether of metacresol or other substituted phenol, with a metallic chloride, as aluminium chloride; heating, mixing with water, and isolating the butylated cresolether, thereby obtaining an aromatic, colorless liquid; introducing the ether into fuming nitric (or nitric and sulphuric) acid; heating, and crystallizing from a solvent, as alcohol.

536,324—March 26, 1895. A. BAUR. *Artificial musk.*

A new compound, the trinitro-derivative of butylhydrindene, in the form of white needles, sparingly soluble in alcohol having a m. p. 139°–140° C., is produced by heating an ethol-aromatic hydrocarbon, such as hydrindene, with a chloride, such as butylic chloride, in presence of a metallic chloride, and nitrating the product.

546,086—September 10, 1895. A BISCHLER. *Artificial musk and process of making same.*

A new compound, a white crystalline body, insoluble in water and soluble in alcohol and ether, is produced by forming a cyanide derivative of an aromatic butylic hydrocarbon—such as cyanide of butyl toluene—heating the same in a mixture of fuming nitric and sulphuric acid, and cooling and precipitating from a solvent, as alcohol.

559,783—May 5, 1896. A. MÜLLER-JACOBS. *Process of making artificial musk.*

A saturated solution of the soluble parts of kerosene or naphtha in ice-cold sulphuric acid is nitrated, then gradually heated to 65° to 82° C., neutralized with ammonia or other alkali, and the neutralized product, mixed with a neutral resin soap, is precipitated by means of a solution of a metallic salt, as sulphate of aluminum.

560,771—May 26, 1896. A. BAUR. *Artificial musk.*

A new product, crystallizing in white needles, m. p. 137° C., insoluble in water and soluble in organic solvents as alcohol, is produced by treating butylxylene in the presence of aluminium chloride with homologous fatty chlorides such as acetyl chloride, and nitrating the ketone thus obtained.

602,961—April 26, 1898. C. SCHMID. *Process of making artificial musk.*

A new product, derived from resins, a heavy orange-red oil, is produced by distilling certain fossil resins, such as copal, amber, or retin resin, with superheated steam; treating the distillate of wax-like or oily consistency with oxidizing reagents, as a mixture of potassium bichromate and sulphuric acid; neutralizing the filtered mass by ammonia and alcohol; driving off the alcohol, and extracting with ether.

For other products of this group, see Group XVIII, "Fine Chemicals."

GROUP XVII.—COMPRESSED AND LIQUEFIED GASES.

HYDROGEN.

*229,339—June 29, 1880—*C. M. TESSIÉ DU MOTAY. *Process and apparatus for manufacturing hydrogen gas.*

A current of watergas and steam is passed through a body of highly heated lime, thereby converting the mixture into hydrogen and carbonic acid, and then through a body of lime at a lower temperature whereby the carbonic acid is absorbed. The carbonate of lime is reconverted for reuse by burning in its presence a gas containing hydrogen.

229,340—June 29, 1880. C. TESSIÉ DU MOTAY. *Process for the production of hydrogen gas.*

A current of coal gas is passed through a secondary highlyheated converting-generator, thereby increasing its volume, subsequently said gas is passed through a highly heated body of lime, decomposing during the passage the hydrogen compounds contained in the gas, in connection with water vapor, and then the products are passed through lime at a lower temperature.

366,081—July 5, 1887. H. H. EDGERTON. *Obtaining hydrogen from water gas.*

Hydrogen is separated from the heavier constituents of water gas by dialysis.

CHLORINE.

506,640—October 10, 1893. R. KNIETSCH. *Package of liquid chlorine.*

A new article, liquid chlorine in an iron or steel vessel, and sufficiently anhydrous not to attack the iron or steel.

649,565—May 15, 1900. C. E. ACKER. *Process of manufacturing caustic alkali and halogen gas.*

See Group X, Electro-chemistry.

OXYGEN.

66,279—July 2, 1867. H. A. ARCHEREAU. *Improved mode of preparing oxygen and applying the same to useful purposes.*

Sulphuric acid is heated and decomposed into sulphurous acid, water, and oxygen, and the oxygen collected and compressed for use in producing high temperatures in metallurgic operations.

71,657—December 3, 1867. B. R. SMITHSON. *Improved apparatus for generating oxygen gas.*

Sulphuric acid is fed into a retort filled with pumice stone maintained at a red heat; a washer absorbs the sulphurous-acid vapors, the oxygen passing to a receiver.

86,248—January 26, 1869. O. M. PHILLIPS. *Improvement in the manufacture of oxygen-gas.*

In the production of oxygen gas from alkaline manganates a partial vacuum is formed at certain intervals in the retort to facilitate gas generation.

307,041—October 21, 1884. M. HERZOG. *Apparatus for the dialysis of air.*

A dialyzing apparatus for air has a series of chambers separated by a series of colloid or caoutchouc septa with an air pump for creating a suction and eliminating the nitrogen and producing superoxygenated air.

432,815—July 22, 1890. A. BRIN. *Process of obtaining oxygen from air.*

Barium oxide is heated in a retort to from 650° to 800° C.; air is then admitted until peroxidation takes place, when the air supply is shut off, and the barium is deoxidized by reducing the pressure without changing the temperature of the retort.

440,777—November 18, 1890. F. SALOMON. *Process of obtaining oxygen.*

A mixture of a metallic oxide, such as lead monoxide or lead carbonate, and an alkaline earth, such as lime, is heated in a current of air so as to cause oxygen to be absorbed, which is then expelled by a current of carbonic-acid gas.

500,697—July 4, 1893. G. WEBB, Jr., AND G. H. RAYNER. *Process of making oxygen.*

For the production of ogygen gas from air a composition is used, formed of caustic soda dissolved in hot water with oxide of manganese and manganate of soda added, all in equal parts; the mass being then heated and evaporated to dryness, and then heated to a temperature in excess of that of the oxygen manufacture. After cooling, the mass is broken into pieces and rolled in powdered oxide of manganese prior to use.

545,973—September 10, 1895. J. PURVES. *Process of making gas and apparatus therefor.*

Fuel gas is made with denitrogenized air to increase its calorific power. Oxygen produced from air by the action of a metallic oxide—as barium oxide, which will absorb oxygen from air when heated, and liberate the absorbed oxygen when raised to a higher temperature—is fed to the producer, the heat of the hot gases being used to heat the oxygen retorts. The latter are made double and revolvable, and the generation of oxygen continuous by the periodic reversal of the retorts and alternate raising and lowering of their temperatures.

576,915—February 9, 1897. A. SWEETSER. *Apparatus for making oxygen.*

As a new article of manufacture for feeding into an oxygen-generating apparatus, oxygen-yielding material is formed into cakes or rods provided with a covering that is nonconductive of heat.

588,613—August 24, 1897. E. B. STUART. *Compound for separating oxygen and method of making same.*

A manganate and an alkali—as binoxide of manganese, 24 parts, and caustic soda, 76 parts—the alkali being in excess of that necessary to form a manganate, are melted; the compound being liquid and nonvolatile above the temperature at which steam forms and below that which decomposes steam.

588,615—August 24, 1897. E. B. STUART. *Process of and compound for separating oxygen.*

Atmospheric air and steam are alternately passed through a fused mixture of a manganate and an alkali salt, as a chloride of an alkaline earth capable of fusing and remaining in a permanent liquid form when fused.

588,616—August 24, 1897. E. B. STUART. *Oxygen-separating compound and method of making same.*

A nonaqueous oxygen-absorbing preparation, containing an oxygen-absorbing material, as oxide of manganese, and sufficient fusible material, as caustic soda, to cause the mass to liquefy and remain so at a temperature below that which decomposes steam, is formed by heating manganese, its oxide or salt, with fusible material, in the presence of oxygen at a temperature between that at which a manganate forms and that at which steam decomposes, and adding the fusible material until the mass becomes liquid.

588,617—August 24, 1897. E. B. STUART. *Method of obtaining oxygen and nitrogen from air.*

Air and steam are alternately passed through a fusible chemical, such as a manganate of soda, in liquid form.

NITROGEN.

207,086—August 13, 1878. G. A. TREUTLER. *Improvement in processes for the continuous preparation of nitrogen gas.*

Nitrogen gas is continuously prepared by forcing air through iron filings mixed with a hygroscopic material and moistened with ferrous sulphate, whereby the oxygen is absorbed from the air and the iron salt is converted into ferric sulphate, and the latter is then deoxidized by the action of the metallic iron.

225,730—March 23, 1880. T. B. STILLMAN. *Manufacture of nitrogen gas.*

In the manufacture of nitrogen gas, to remove all traces of oxygen, the gas is passed through melted sodium, potassium, or other metal having a high affinity for oxygen.

226,632—April 20, 1880. T. B. STILLMAN. *Manufacture of nitrogen gas.*

Nitrogen gas is purified and oxygen removed therefrom by passing it through an apparatus containing anhydrous phosphoric acid, anhydrous sulphuric acid, or anhydrous chloride of zinc, and then over or in contact with melted sodium, potassium, or other metal having a high affinity for oxygen.

281,002—July 10, 1883. J. F. BENNETT. *Apparatus for separating nitrogen from atmospheric air.*

It employs a series of annular chambers with porous walls, together with an air pump, to remove a part of the nitrogen from air by reason of its more ready diffusion through the porous walls.

NITROUS OXIDE.

87,319—March 2, 1869. W. P. BARKER. *Improvement in the use of nitrous oxide as an anæsthetic agent.*

Nitrous oxide is mixed with chloroform, or other anæsthetic.

120,978—November 14, 1871. W. F. & W. A. JOHNSTON. *Improvement in methods of compressing and liquefying nitrous oxide and other gases.*

Claims the apparatus of process No. 120,977; a hydraulic pump with one or more tanks or series of tanks.

SULPHUR DIOXIDE.

127,008—May 21, 1872. N. P. AKIN. *Improvement in the manufacture of sulphurous acid.*

Sulphur or pyrites is burned in a closed water-jacketed chamber under pressure, which is maintained likewise in the washing chamber and condenser. Liquid sulphurous acid and an aqueous solution of sulphurous acid from the unliquefied gases are simultaneously produced.

187,413—February 13, 1877. R. P. PICTET. *Improvement in processes of producing artificial cold by means of anhydrous sulphurous oxide.*

Anhydrous sulphurous oxide is used as a refrigerating agent.

191,778—June 12, 1877. R. P. PICTET. *Improvement in manufacturing sulphurous anhydride.*

Sulphur and sulphuric acid are heated, the product passed through a cleansing medium and a dehydrating medium, and liquefied by pressure, in a continuous operation.

376,883—January 24, 1888. E. HÄNISCH AND M. SCHROEDER. *Process of obtaining sulphurous acid.*

Liquid sulphurous acid is produced by passing the furnace gases through a spray of water, heating the resulting solution of sulphurous acid to evaporate the sulphurous-acid gas therefrom, cooling the separated gases, and converting the same into liquid form by compression and condensation.

CARBON DIOXIDE.

55,038—May 29, 1866. J. S. BALDWIN. *Improved method of collecting and separating carbonic acid from mixtures of gases.*

Water is sprayed through mixed gases in a chamber under pressure, taking up the carbonic-acid gas; the surcharged water then passing into a second chamber under a partial vacuum, where the gas is set free.

359,996—March 29, 1887. S. CABOT. *Process of and apparatus for making carbon dioxide.*

Limestone is alternately heated to redness by gaseous products of combustion at a high temperature, and with superheated steam with exclusion of air, until its carbon dioxide is expelled, the steam being condensed and removed from the carbon dioxide evolved. A reduced atmospheric pressure is produced and maintained in the closed furnace pending the passage of superheated steam.

383,957—June 5, 1888. H. LEFFMANN. *Manufacture of carbonic acid and heavy magnesia.*

Native magnesite, or magnesium carbonate, is decomposed by heat in a closed retort, producing carbonic acid and extra-heavy magnesia.

496,546—May 2, 1893. W. WALKER. *Process of and apparatus for recovering carbon dioxide.*

Impure carbonic-acid gas is passed through retorts containing a solid carbonate, as carbonate of soda, which absorbs the carbonic acid with the production of a bicarbonate. The nitrogen and other gaseous impurities are thus removed by exhaustion and the temperature raised to cause the pure carbonic-acid gas to pass off. Water is sprayed upon the carbonate and the solution obtained removed, and the carbonate crystallized out for reuse.

523,651—July 24, 1894. E. W. ENEQUIST. *Process of obtaining carbonic acid, sodium sulphate, and magnesium sulphate, etc.*

A solution of niter-cake (containing 24 to 28 per cent of free sulphuric acid) or an alkaline acid sulphate is employed as a solvent for magnesite in the production of carbonic acid. Iron and other impurities are precipitated and removed, sodium carbonate is added, and the resulting magnesium carbonate separated from the sodium sulphate.

APPARATUS.

17,394—May 26, 1857. W. A. ROYCE. *Reissued December 24, 1872. No. 5,201—Improvement in machinery for compressing gaseous bodies. No. 5,202—Improvement in machinery for compressing gaseous bodies.*

Reissue 5,201 relates to the compression of gaseous mediums with means for absorbing the evolved heat and for holding and transmitting the power; the metallic reservoir, pipes, etc., are coated on the inside with close-grained metals, vegetable gums, resins, or oils to retain the gas. Under reissue No. 5,202, serial compression is employed with refrigeration.

120,977—November 14, 1871. W. F. & W. A. JOHNSTON. *Improvement in apparatus for liquefying nitrous oxide and other gases.*

Gaseous or aeriform matter is liquefied by pressure transmitted from a pump by means of a liquid.

214,161—April 8, 1879. F. LITTMANN. *Improvement in apparatus for preparing water for ice machines.*

The process consists in converting water into steam, freeing the steam from impurities, then condensing the steam, and finally heating the water resulting from such condensation by means of a succeeding current of steam to drive off any remaining air.

320,310—June 16, 1885. J. J. SUCKERT. *Method of and apparatus for separating a liquefiable gas from a condensable vapor.*

The process consists in first reducing the temperature of a solution of the gas by the vaporization of a liquefied gas, and then passing the liquefiable gas and intermingled vapor through such cooled solution, thereby liquefying the vapor and separating it from the gas.

389,521—September 11, 1888. E. LUHMANN. *Apparatus for removing gases from liquids.*

A vacuum pan having a spiral channel for the liquor, forms, with two vertical pipes, a siphon, the pipes connecting with the respective ends of the spiral channel.

491,699—February 14, 1893. E. B. CUTTEN. *Preparing liquid chlorine.*

Chlorine gas is dehydrated by steps of cooling, by contact with calcium chloride, and by contact with anhydrous sulphuric acid, and is then liquefied by pressure. The noncondensed gases are then separated, and flasks are charged with liquid chlorine by drawing off from the bottom of the chlorine vessel to the bottom of a flask coupled thereto, causing the air in flask to compress until it attains the pressure of chlorine liquefaction, and then allowing the compressed air in the flask to escape.

503,556—August 15, 1893. E. SOLVAY. *Apparatus for treating pulverulent material with gases.*

Apparatus for process No. 503,558.

503,558—August 15, 1893. E. SOLVAY. *Treating pulverulent material with gases.*

The gas is passed from top to bottom through a body of the material contained in a closed vessel; then the ends of the vessel and the body are reversed and fresh material is added at the temporary top and treated material removed from the temporary bottom, when the vessel with the body of material is returned to its normal position and the passage of gas from top to bottom resumed.

506,639—October 10, 1893. R. KNIETSCH. *Process of and apparatus for making liquid chlorine.*

Chlorine gas is forced through a body of heated sulphuric acid into a confined space and is liquefied by pressure transmitted through the sulphuric acid. The sulphuric acid is cut off from the parts of the apparatus exposed to the air by a body of mineral oil.

575,714—January 26, 1897. C. HEINZERLING. *Process of recovering volatile substances from air or other gases.*

The air or gas (as gases from coal distillation, distillation of peat and bituminous shale to obtain oils, distillation of wood, preparation of water-proof texture or tissue and in the production of smokeless powder, and in the production of chloroform, carbon bisulphide, or carbon tetrachloride) is compressed; indirectly cooled by water while compressed; further cooled by indirect contact with previously expanded portions of the air or gas, a portion of the volatile substances being separated by the latter reduction of temperature; and finally the air or gas is permitted to expand to substantially normal pressure, whereby the remaining volatile substances are separated.

625,759—May 30, 1899. E. C. HARGRAVE. *Liquid air conveying conduit.*

The liquefied air is piped from one point to another, a portion being allowed to evaporate, and conveyed through an annular space around the main body of the air or gas to maintain said body in a liquefied state and prevent undue pressure therefrom.

650,608—May 29, 1900. T. J. McTIGHE. *Method of cooling gases.*

A compressed gas, with the heat of compression removed, is caused to act expansively in elevating within a heat-insulated tube a suitable liquid cooler than itself, thereby doing work and falling in temperature in proportion to the work done, the expanded and cooled gas cooling a further body of compressed gas.

GROUP XVIII—FINE CHEMICALS—INORGANIC.

BROMINE AND IODINE.

12,077—December 12, 1854. E. STIEREN. *Reissued June 1, 1869. No. 3479—Improved process of treating the mother-water of salines to obtain useful products. No. 3480—Improved apparatus for obtaining bromine and other products from the mother-water of salines.*

Sulphate of magnesia is obtained from bittern water of saline springs by evaporating to 36° Baumé, treating with lime, filtering, washing the precipitate, treating with sulphuric acid, concentrating and crystallizing. Iodine is obtained from the lye separated from the hydrate of magnesia by treating with soda sulphate, removing the sodium chloride, treating the liquor with sulphate of copper and iron, and the precipitate thereof with manganese and heat. Bromine is obtained from the liquor after heating with soda carbonate or caustic soda.

62,464—February 26, 1867. D. ALTER. *Improved apparatus for the manufacture of bromine and iodine.*

The retort consists of a stone box and lid with a leaden heating flue.

62,988—March 19, 1867. D. ALTER. *Improvement in the distillation of bromine and iodine.*

The fumes of bromine and hydro-bromic acid are absorbed by an alkali.

82,309—September 22, 1868. G. A. HAGEMANN. *Improvement in the manufacture of bromine from bittern.*

A sandstone trough or vessel is used, furnished with a bore, for the introduction of steam to dispense with the insertion of metallic pipes into the liquor. Naked steam is introduced into the body of the liquor to combine the mechanical action of the steam with the physical effects of its heat.

110,662—January 3, 1871. J. J. JÜHLER. *Improvement in apparatus for the manufacture of bromine.*

Stills are made of wood, or with a lining of wood, which chars to a certain depth, and then the destructive action of the bromine ceases.

217,076—July 1, 1879. J. N. J. DUBREUIL. *Improvement in manufacture of iodine and bromine.*

To prepare green seaweed for the extraction of its useful salts, the weeds are first disintegrated, then lime is mixed with the pulped mass and the liquid extracted by straining or pressing. The salts are then precipitated from the solution.

219,004—August 26, 1879. R. MÜLLER AND H. BÖCKEL. *Improvement in the manufacture of iodine and bromine.*

To obtain iodine and bromine from bittern or other liquids containing them, the liquor is subjected in a finely divided and heated state to the action of chlorine gas.

356,291—January 18, 1887. F. C. PHILLIPS. *Process of obtaining iodine from bittern.*

Iodine is first set free from its chemical combination in the bittern and is then absorbed with dead-oil or equivalent oily or tarry substance, and the iodine extracted from the oil by means of an alkali and distillation. The resulting bittern liquor is distilled to extract the bromine therefrom.

356,292—January 18, 1887. F. C. PHILLIPS. *Extracting bromine and iodine from bittern.*

Bromine and iodine are first set free from the chemical combination in which they occur in salt-water bittern, and dead oil, or heavy oil from coal tar, is then mixed therewith to absorb them; the oil is then separated from the bittern, and the bromine and iodine extracted from the oil by means of an alkali, as caustic soda.

447,926—March 10, 1891. H. H. WING. *Process of obtaining bromine and iodine.*

Bittern, concentrated to a sirupy consistency, is mixed with silicious material and calcined, producing fumes of chlorine, bromine, and iodine, which fumes are brought in contact with bittern water in a tower, whereby the bromine and iodine of the latter are liberated by the chlorine, and the iodine and bromine collected.

448,541—March 17, 1891. T. PARKER AND A. E. ROBINSON. *Process of making iodine by electrolysis.*

See Group X, Electro-chemistry.

456,183—July 21, 1891. H. H. WING. *Process of obtaining iodine.*

The mother-liquor resulting from the purification of sodium nitrate is mixed with silicious material and calcined, and the sublimed iodine collected from the fumes. The uncondensed vapors are brought in contact with a further quantity of said mother-liquor to effect a further purification of iodine.

460,370—September 29, 1891. H. H. DOW. (*Reissue: 11,232—April 12, 1892.*) *Process of extracting bromine.*

Bromine in brine or bittern water is first freed from its chemical combination, the bromine is then separated from the brine by means of an air blast, and the bromine-laden air is forced through a metal or substance that will combine with the bromine, producing a bromide, which is boiled to dryness out of contact with the air.

461,681—October 20, 1891. J. C. KAUTZ. *Process of purifying bromine.*

The bromine vapors, before condensation, are passed through a solution of the bromide maintained at the proper temperature.

SODIUM AND POTASSIUM.

342,897—June 1, 1886. H. Y. CASTNER. *Manufacture of sodium and potassium.*

The reduction of the alkali is effected by the carbide of a metal diffused through the alkali in a state of fusion at moderate temperatures. An easily reducible metal or its oxide mixed with a hydrocarbon and coked will serve as a carbide.

380,775—April 10, 1888. O. M. THOWLESS. *Process of obtaining sodium, etc.*

The substance containing the sodium or potassium, as caustic soda, is heated and gradually supplied to heated carbonaceous matter, and the vapors condensed.

380,776—April 10, 1888. O. M. THOWLESS. *Apparatus for obtaining sodium, etc.*

Apparatus for the practice of process No. 380,775.

391,110—October 16, 1888. H. S. BLACKMORE. *Manufacture of sodium.*

A mixture of calcium hydrate, 27.5 pounds; ferric oxide, 31.1 pounds; sodium carbonate, 30.9 pounds; and carbon, 10.5 pounds; is heated and the vapors collected and condensed.

460,985—October 13, 1891. C. NETTO. *Process of making sodium or potassium.*

Caustic alkali is brought into contact with reducing carboniferous matter at such a low temperature that only the caustic alkali is reduced to a metallic state, while the alkali carbonate simultaneously formed remains undecomposed and is withdrawn out of reach of the carboniferous matter without interruption of the reducing process.

SELENIUM.

235,616—December 21, 1880. A. G. BELL AND S. TAINTER. *Process of treating selenium to increase its electric conductivity.*

To increase the electrical conductivity and sensitiveness to light of selenium it is gradually heated to a point where the selenium is beginning to fuse and then allowed to cool, the proper moment for stopping the heating being shown by the ceasing of the increase of deflection of a galvanometer needle, and also by a change from a leaden color to blackish or nearly black.

RARE EARTHS.

87,477—March 2, 1869. C. M. TESSIÉ DU MOTAY. *Improvement in preparing zirconia for use in producing light, and for other purposes.*

The silicate of zirconium is treated with chlorine in the presence of charcoal, transforming it into the double chloride of zirconium and of silicum; the latter is volatilized off and the chloride of zirconium is then converted into an oxide; the zirconia is then moistened and molded; an agglutinating agent can be used; the pencils, disks, etc., are then highly heated and annealed.

377,701—February 7, 1888. C. A. VON WELSBACH. *Process of obtaining salts of cerium, etc.*

Compounds of the rarer metals—cerium, lanthanum, and didymium—are obtained from their earths by heating the mineral earth, plunging the heated earth into water, crushing, dissolving the fragments in a mineral acid, as concentrated hydrochloric acid, and precipitating by oxalic acid, washing and filtering the precipitate, heating it and afterwards dissolving it in nitric acid, digesting the solution with excess of the earth, separating the precipitate and the solution, dissolving the precipitate in nitric acid, and so producing cerium nitrate, concentrating the solution and heating it with nitric acid and ammonium nitrate, and then separating by fractional crystallization the ammonium double nitrates of lanthanum and of praseodymium and neodymium.

396,300—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

See Group XV, Plastics, Other Plastics.

396,301—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

See Group XV, Plastics, Other Plastics.

396,302—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

See Group XV, Plastics, Other Plastics.

306,303—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

See Group XV, Plastics, Other Plastics.

396,304—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

See Group XV, Plastics, Other Plastics.

396,305—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

See Group XV, Plastics, Other Plastics.

396,306—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

See Group XV, Plastics, Other Plastics.

396,307—January 15, 1889. J. L. STEWART AND J. L. HASTINGS. *Plastic mineral composition, etc.*

See Group XV, Plastics, Other Plastics.

396,693—January 22, 1889. J. L. HASTINGS. *Process of producing refractory compounds.*

A refractory crystalline compound, available for incandescent illumination, is produced by forming a base from two or more pulverized mineral substances—such as oxides, carbonates, or sulphates of metals, e. g., an intimate mixture of strontium oxide (caustic) and carbonate, calcium oxide and carbonate, and magnesium oxide and carbonate—mixing said base with a flux composed of one or more haloid salts—such as chlorides, iodides, fluorides, or bromides of metals, e. g., a mixture of calcium iodide, magnesium chloride, strontium chloride, and calcium fluoride—moistening the mixture with perchloric acid, molding and drying, and finally exposing to a high temperature.

400,335—March 26, 1889. J. L. HASTINGS. *Plastic mineral composition.*

See Group XV, Plastics, Other Plastics.

400,336—March 26, 1889. J. L. HASTINGS. *Plastic mineral composition.*

See Group XV, Plastics, Other Plastics.

409,584—August 20, 1889. J. L. HASTINGS. *Plastic mineral composition.*

See Group XV, Plastics, Other Plastics.

409,653—August 20, 1889. C. A. VON WELSBACH. *Process of obtaining zirconium nitrate.*

Zirconium nitrate in a form suitable for an incandescent body is produced by first converting the zirconium into a sulphate, and after treating with ammonia dissolving the same in nitric acid, thereby obtaining a precipitate which is digested with ammonia, dissolved in nitric acid, and evaporated.

410,865—September 10, 1889. F. THIELE. *Process of making zirconium nitrate.*

Water-soluble nitrate of zirconium is produced by subjecting zirconium ores to the action of hydrochloric acid, heating the residue with sulphuric acid for several hours to form zirconium sulphate, and adding a concentrated solut on of barium nitrate to form by reaction therewith zirconium nitrate, barium sulphate being precipitated.

571,531—November 17, 1896. R. LANGHANS. *Process of producing coatings composed of earthy oxids.*

See Group X, Electro-chemistry.

571,532—November 17, 1896. R. LANGHANS. *Process of producing coatings composed of earthy oxids.*

See Group X, Electro-chemistry.

617,636—January, 10, 1899. W. BUDDEUS. *Process of obtaining thorium oxids.*

Monazite sand is comminuted and introduced into molten alkali hydrate; the resultant mass dissolved in hot water; the resultant alkali phosphate crystallized out; the mother liquor evaporated; water added to the residue, stirred, and the liquor containing the oxides of thorium and of the cerium bases is decanted or otherwise removed from the heavy sediment of ferrous titanate and zircon. The mixture of the oxides of thorium and of the cerium bases is treated with sulphurous acid to dissolve out the oxides of the cerium bases and leave the thorium oxide.

PLATINUM METALS.

241,216,—May 10,1881. J. HOLLAND. *Process of fusing and molding iridium.*

The metal is subjected to a high heat and then about one-fourth its weight of phosphorus is added, when it quickly fuses and is cast in highly heated molds. As soon as set it is placed in a crucible with lime, and again highly heated to eliminate the phosphorus.

HYDROCARBONS.

CARBON COMPOUNDS.

130,909—August 27, 1872. H. J. FENNER AND F. VERSMANN. *Improvement in the manufacture of anthracene.*

Anthracene is obtained by the distillation of coal-tar pitch by a regulated temperature of from 315° to 425° C. from heat externally applied. A partial vacuum assists the distillation.

173,862—February 22, 1876. C. LOWE AND J. GILL. *Improvement in processes for separating mixed coal-tar products.*

Carbolic acid is crystallized from mixed tar acids by successive steps of refrigeration, crystallization, and dehydration, the mixed tar acids being in a state of partial or complete hydration.

227,538—May 11, 1880. F. SALATHÉ. *Manufacture of anthracene.*

Anthracene tar, produced by treating petroleum or its derivatives in the presence of charcoal at a dull red heat (400° to 550° C.), and condensing the tarry matter produced.

372,243—October 25, 1887. J. VAN RUYMBEKE. *Aniline tar.*

Tar containing about 7 per cent of nitrogen and available for the direct production of aniline by treatment with acid is obtained from concentrated tank waters by distillation.

386,830—July 1, 1888. W. KELBE. *Process of obtaining retene.*

Retene ($C_{18}H_{18}$) is produced by heating resin-oil—a product of the dry distillation of colophony—with sulphur until the formation of hydrogen sulphide is finished. The raw retene obtained by distillation of the residue. or by extraction by a solvent, is purified by repeated crystallizations.

563,528—July 7, 1896. T. L. WILLSON. *Process of manufacturing hydrocarbon gas.*

See Group X, Electro-chemistry.

588,230—August 17, 1897. E. F. MACKUSICK. *Process of generating gas from carbides.*

The carbide is treated with a mixture of water and glycerine, or other nonvolatile, noninflammable, and recoverable fluid which does not react upon the carbide, the whole mass of carbide being exposed to the action of the liquid, which is compounded in accordance with the desired strength of the current of gas.

596,139—December 28, 1897. W. BOLTON. *Process of generating acetylene gas.*

Calcium carbide is impregnated with a substance substantially insoluble in water—such as stearine, the rate of gas generation being regulated by the degree of impregnation.

625,479—May 23, 1899. F. ULLMANN. *Process of purifying acetylene gas.*

Impure acetylene gas is treated with oxidizing chromic compounds in which the chrome is present as an acidifier—for instance, with chromic acid or aqueous or acidified chromic-acid solution or acidified bichromate solution—for the purpose of oxidizing the impurities.

635,017—October 17, 1899. C. B. JACOBS. *Process of making benzine and homologues.*

Hydrocarbons are produced by mixing together a metallic carbide and a fusible metallic hydrate of molecular equivalent weights—as barium carbide and barium hydrate—and subjecting the mass to a heat sufficient to fuse the hydrate, forming an oxide and benzene and its homologues, anthracene, napthalene.

638,175—November 28, 1899. E. S. DOLAN. *Method of generating acetylene gas.*

Small quantities of calcium carbide are tightly wrapped in a plurality of thicknesses of pliable, porous material—as coarse cheesecloth—and several of the packages are placed within a gas-generating chamber in contact with each other and water is applied.

641,444—January 16, 1900. E. DE FAZI. *Manufacture of gas.*

A mixture of calcium monoxide, colophony, and calcium carbide—as calcium monoxide, 80 parts; colophony, 10 parts; and calcium carbide, 5 parts—is treated with water.

646,019—March 27, 1900. E. DE FAZI. *Manufacture of gas.*

A mixture of calcium monoxide, bitumen, and calcium carbide—as calcium monoxide, 80 parts; bitumen, 10 parts; and calcium carbide, 5 parts—is treated with water.

647,295—April 10, 1900. O. ERNST AND A. PHILIPS. *Material for purifying acetylene gas.*

A solid, highly porous metal containing a salt of hypochlorous acid; as bleaching powder stirred into a sludge with slacked lime and calcium chloride and dried at such a temperature that the salt of hypochlorous acid does not decompose.

647,559—April 17, 1900. J. A. DEUTHER. *Process of producing ethylene gas.*

Ethylene gas, C_2H_4, is produced by decomposing water in the presence of a compound composed of a metal capable of decomposing water, and the carbide of such metal, whereby the nascent hydrogen transforms the generated acetylene into ethylene.

648,638—May 1, 1900. J. H. GREEN. *Process of manufacturing gas.*

Calcium carbide and liquid hydrocarbons, as gasoline, are placed in a vessel and water fed at intervals to the mixture, whereby the generated gas will pass through the liquid hydrocarbons and collect gas from the same.

659,448—October 9, 1900. M. P. E. LETANG. *Process of generating acetylene gas from carbide of calcium.*

Calcium carbide and glucose, or like substance, which will render lime soluble or fluid, are simultaneously subjected to the action of water.

661,401—November 6, 1900. E. FOUCHÉ. *Process of storing explosive gases.*

The receiver is filled with a porous substance provided with numerous separate small bores or perforations, filled with a suitable fluid, and the compressed gas is charged into the receiver where it is absorbed by the liquid and stored in isolated quantities; or the gas itself is compressed into liquid form and stored thereby in isolated quantities in the porous substance.

622,258—November 20, 1900. E. N. DICKERSON. *Process of storing acetylene gas.*

Liquefied acetylene gas is mingled, in miscible proportions, with a solvent, such as fusel oil, and maintained under a reduced pressure.

HALOID COMPOUNDS

CHLORIDES

218,671—August 19, 1879. J. F. GESNER. *Improvement in manufacture of ethyl-chloride.*

A current of hydrochloric-acid gas is passed through a boiling alcoholic solution, the water and alcohol separated from the resulting gas, and the chloride-of-ethyl vapor purified and condensed as a continuous operation.

220,397—October 7, 1879. J. W. MALLET. *Improvement in the manufacture of chloroform and allied products.*

Chlorine, or other analogous element, and methane, ethane, or other hydrocarbon gas, are passed through a body of porous material not acted upon by the chlorine, as prepared carbon. The temperature should be between 30° and 90° C.

322,194—July 14, 1885. G. MICHAELIS. *Manufacture of chloroform and of purified acetates.*

Crude acetates are subjected to dry distillation at high temperatures to remove the fluid products therefrom, which are subjected to the action of a hypochlorite and the chloroform condensed, the residual products of the dry distillation being suitable for conversion into acetic acid or purified acetates.

383,992—June 5, 1888. G. RUMPF. *Manufacture of chloroform from acetone.*

Acetone in a dilute state is periodically introduced into the bottom of a still containing cloride of lime solution with agitation of the solution. The chloride of lime employed is more than five times the weight of the acetone, resulting in the chloroform produced equaling the acetone in volume.

427,744—May 13, 1890. T. F. COLIN. *Process of obtaining chlorine compounds from natural gas.*

See Group X, Electro-chemistry.

435,862—September 2, 1890. E. G. SCOTT. *Process of making carbon tetrachloride.*

Chlorine is passed into iodine and carbon bisulphide and the resultant mass fractionally distilled, whereby the tetrachloride is separated from the sulphur bichloride, the latter being left as a by-product. The iodine is separated from the tetrachloride by caustic alkali, and a mixture or compound of carbon sulphide and iodine is produced, suitable for use in the first step.

489,592—January 10, 1893. R. P. PICTET. *Process of purifying chloroform.*

Commercial chloroform is cooled to −80° to −82° C. and the solid bodies removed by filtration. It is then cooled below −80° C. and the noncrystallizable parts, which contain impurities, removed. The chloroform is then distilled at a very low temperature and the middle 80 per cent of the product taken as chemically pure.

535,270—March 5, 1895. R. AUSCHÜTZ. *Process of obtaining chloroform.*

Chemically pure chloroform is produced by decomposing by heat double compounds of chloroform and lactid-like condensation products, derived from ortho-phenol carbonic acids, as salicylid, and condensing the pure chloroform. Salicylid-chloroform is prepared by boiling salicylid in chloroform.

551,131—December 10, 1895. P. MONNET. *Process of making toluenesulphochlorids.*

Liquid or ortho-toluenesulphochloride is produced by the direct action of chlorsulphonic acid on toluene at a temperature not exceeding 5° nor below 0° C., in the presence of a large excess of said acid and with constant agitation.

554,974—February 18, 1896. H. BAUM. *Process of making orthohalogenphenol.*

Orthohalogens of phenol, particularly the bromine and chlorine combinations, are produced by the action of the desired halogen upon phenol heated to about 150° C. It is purified by binding a portion of the product to an alkali base and the ortho compound is separated in a pure state by distillation.

573,483—December 22, 1896. O. PORSCH. *Process of making chloroform and apparatus therefor.*

Vapors from the dry distillation of an acetate, and chlorine gas, are continuously discharged, in opposite directions, under pressure, in an aqueous bath of an alkaline earth, as milk of lime, subjected to heat. The hydrochloric acid is separated from the resultant vapors and the chloroform vapors condensed.

578,839—March 16, 1897. B. R. SEIFERT. *Process of making aromatic nitrosulfo chlorids.*

Aromatic nitro compounds are heated with chlorhydrin sulphuric acid in excess of one molecule. The liquid mass is then poured onto ice and the precipitated nitrobenzenesulpho-chloride strained off. The acid in the mother-lye is converted into sodium salt, and then treated with the chloride of a mineral acid to obtain a further quantity of the chloride.

603,195—April 26, 1898. W. MAJERT. *Process of purifying orthotoluenesulfochlorid.*

A part of the orthotoluene-sulpho-chloride is distilled out from a mixture of the ortho and para-chlorides; the residue is then cooled to crystallize out a part of the paratoluene-sulpho-chlorides, when the liquid is again distilled and again cooled.

606,470—June 28, 1898. P. P. MONNET. *Process of making chlorin derivatives of toluene.*

The ortho or paratoluene-sulpho-chloride when heated to 150° C. is treated with a current of dry chlorine gas and the reaction maintained at 150° to 200° C. until the required chlorine has been absorbed.

BROMIDES.

462,544—November 3, 1891. F. H. FISCHEDICK AND C. E. KOECHLING. *Bromine compound.*

Bromamid, (tribrom bromanilid), a new compound for use as an antiypyretic, of the formula $C_6H_2B_3$, NH. HBr; m. p. 115° C. It is formed by the action of bromine on a solution of aniline in alcohol.

621,319—March 21, 1899. J. BREDT. *Bromin derivative of phthalimid, and process of making same.*

A new compound, $C_8H_4NO_2$ Br, a white crystalline powder, m. p. 206° to 207° C., yielding bromine when strongly heated, is produced by dissolving phthalimid in dilute caustic lye, stirring the solution into an ice-cold aqueous solution of bromine, and filtering and drying at a low temperature.

IODIDES.

322,940—July 28, 1885. T. KEMPF. *Manufacture of iodoform, bromoform, and chloroform.*

See Group X, Electro-chemistry.

436,250—September 9, 1890. J. MESSINGER AND G. VORTMANN. *Substitute for iodoform.*

A new product; a red brown odorless powder; m. p. 225° C. It is derived from iodine and salycylic acid.

446,875—February 24, 1891. J. MESSINGER AND G. VORTMANN. *Compound of iodine with thymol.*

A new iodine substitution product of thymol; an amorphous odorless brown-red powder; m. p. 110° C. It is produced by the action on an aqueous solution of thymol to which soda lye has been added, of a solution of iodine in an alkaline iodide at a temperature of 15° C.

454,223—June 16, 1891. E. OSTERMAYER. *Compound of antipyrine and iodine.*

A new compound for medicinal purposes, having the formula $C_{11}H_{11}IN_2O$; m. p. 160° C. It is formed by the action of potassium carbonate and iodine upon a solution of antipyrine.

472,828—April 12, 1892. L. SCHOLVIEN. *Iodine derivatives of acetyl paramidophenetole.*

Tri-iodine-diacetyl paramidopenetole, or "iodophenin," is a new product of the formula $C_{20}H_{25}N_2O_4I_3$; M. P. 130°. It is produced by combining a solution of acetyl paramido-phenetole with a solution of iodine.

509,617—November 28, 1893. F. GOLDMANN. *Pharmaceutical compound.*

A new compound, of the formula $C_7H_6OI_3$, a white crystalline powder, m. p. 121.5° C., soluble in ether, etc., but with difficulty in alcohol, is produced by treating one molecular proportion of creosotinic acid with three of iodine.

561,531—June 2, 1896. L. C. URBAN. *Carvacrol iodid.*

A new product, an amorphous yellowish-gray or buff powder, m. p. 153° C., insoluble in water and alkali, is produced by dissolving in water a mixture of carvacrol 1 part, and sodium hydroxide 2 parts, and adding an aqueous iodine solution with constant stirring at 15° C.

575,175—January 12, 1897. A. SCHUFTAN. *Iodoform substitute.*

A new product, a yellow, light powder, insoluble in water, soluble in alcohol, etc., decomposing at 127° C., is produced by dissolving methylenebisphenyldimethylpyrazolon in hydrochloric acid and adding bromine water to the solution.

576,494—February 2, 1897. A. CLAUS. *Metaiodinorthoöxyquinolinana-sulfonic acid.*

A new product, m. p. 285° C, with separation of iodine, sparingly soluble in water; is produced by subjecting an alkaline solution of orthoöxyquinolinana-sulphonic acid to the action of an iodine, and then to the action of hydrochloric acid.

618,167—January 24, 1899. A. CLASSEN. *Sodium salt of iodin compound.*

See Group X, Electro-chemistry.

618,168—January 24, 1899. A. CLASSEN. *Iodin derivatives of phenols and bismuth salts thereof.*

See Group X, Electro-chemistry.

627,981—July 4, 1899. A. CLASSEN. *Iodin compound and process of making same.*

New compounds, odorless, derived from phenolphtalein in the form of powders, of the general formula $C_{20}H_{10}I_4O_4$, in which the hydrogen atoms of the hydroxyl groups may be replaced by metallic atoms, as tetraiodophenolphtalein. They are produced by reacting with iodating agents upon a solution of phenolphtalein. The product is treated with an acid; the precipitate dissolved in sodium hydrate, and treated with a metallic salt.

627,982—July 4, 1899. A. CLASSEN. *Iodin derivatives of aromatic amins and process of making same.*

New odorless compounds are produced by treating a secondary aromatic amin, as diphenylamin, with iodine, and absorbing the hydroiodic acid formed with mercury oxide. The product is combined with a substance, such as acetyl chloride, adapted to form a derivative containing the iodine atoms in the nucleus.

641,491—January 16, 1900. A. BISCHLER. *Iodochloroxyquinolin.*

A new product, a greyish-yellow, scentless powder, almost insoluble in water, is obtained by treating an aqueous solution of an alkaline salt of the chlor-5-oxy-8-quinolin with potassium iodide and hypochlorites.

143,144—February 13, 1900. L. LEDERER. *Process of preparing haloid derivatives of acetone.*

A halogen is caused to react with acetone dicarbonic acid in the presence of a substance adapted to act on the corresponding halogen hydrogen acid

FLUORIDES.

643,835—February 20, 1900. F. VALENTINER. *Process of making fluoroform.*

An intimate mixture of iodoform, fluoride of silver, and inert granular material, as sand, is warmed.

ALCOHOLS AND PHENOLS.

252,782—January 24, 1882. A. LIEBMANN. *Manufacture of the higher homologues of phenol, naphthol, and resorcin.*

Phenol, naphthol, and resorcin are transformed into their higher homologues by subjecting them in a suitable still to the action of the corresponding fatty alcohols in the presence of chloride of zinc.

407,442—July 23, 1889. E. MEYER. *Process of obtaining methyl alcohol from wood-pulp lyes.*

Lyes produced in the manufacture of wood pulp are concentrated, mixed with charcoal, briquetted, distilled, and the methyl products condensed. The charcoal is revived for further use by lixiviation. The distillate is free from formic, acetic, and other tar acids.

427,620—May 13, 1890. K. SCHOLZ. *Obtaining permanent hydroquinone.*

Permanent or durable hydroquinone in citron yellow crystals is obtained by recrystallizing in the presence of sulphuric acid.

466,913—January 12, 1892. B. R. SEIFERT. *Carbonate of guaiacol and creosol.*

New medical compounds obtained by the action of phosgene on guaiacol or the homologue creosol. Carbonate of guaiacol, having a m. p. of 85° C., is of the formula CO $(OC_6H_4OCH_3)_2$. If creosol is used, the homologous carbonate has a m. p. of 145° C.

479,781—August 2, 1892. C. W. BRUNSON. *Process of purifying liquids.*

See Group X, Electro-chemistry.

482,101—September 6, 1892. B. R. SEIFERT. *Process of making disinfectants.*

Phenols difficultly soluble in water, as cresol or crude carbolic acid, are converted into soluble disinfecting mixtures by mixing with water and a metallic salt of an aromatic compound of the classes of aromatic acids and phenols, as salicylate of soda.

495,204—April 11, 1893. J. MESSINGER, G. VORTMANN AND H. JANSSEN, *Compound of cresol, etc.*

A new compound, para-isobutyl-ortho-cresoliodide, a yellow powder, insoluble in water and caustic alkalis, decomposing above 60° C., is produced by treating para-isobutyl-alpha-cresol in alkaline solution with iodine.

501,235—July 11, 1893. B. R. SEIFERT. *Creosote compound.*

A new compound, creosote chemically united with carbon dioxide, being a semi-fluid oil, not caustic, is produced by treating creosote dissolved in soda lye with phosgene, or by heating creosote with ethers of carbonic acid.

516,358—March 13, 1894. B. R. SEIFERT. *Phenol-bismuth compound.*

New antiseptic compounds of phenols in chemical combination with bismuth, nearly non-poisonous, neutral and insoluble in water, alcohol and ether, are produced by treating the poisonous phenols in an acid, neutral or alkaline solution with bismuth salts, filtering and washing.

526,786—October 2, 1894. O. MANASSE. *Process of making phenol alcohol.*

Formaldehyde is caused to act on phenol or phenol-like substances in the presence of alkaline or neutral condensing agents, such as soda lye, potassa lye, potassium cyanide, etc.

541,096—June 18, 1895. E. R. KOBERT. *Process of precipitating blood by pyrogallic acid.*

A blood-forming iron preparation is formed by treating blood with pyrogallic acid and washing the precipitate with alcohol.

543,214—July 23, 1895. W. MAJERT. *Aromatic glycocol derivative.*

Glycocol derivatives, crystalline or crystallizable, and having but one acetamid remainder bound to one nitrogen atom, and containing the group $NHCOCH_2NH_2$, are produced by treating a glycocol ether or glycocolamid, preferably the hydrochlorides, with primary aromatic amins, and separating the derivative by means of an excess of ammonia.

548,719—October 29, 1895. P. P. MONNET. *Process of making rhodinol.*

Raw rhodinol, obtained by fractional distillation of oil of geraniums, is treated with acetic acid; the acetic ether of rhodinol is purified by washing and distillation, and the rhodinol regenerated by saponification of this acetic ether of rhodinol by digesting it with alcoholic caustic alkali. The product is then subjected to several fractional distillations, with the separation as a by-product of a mixture of licaréol and an acetone, having an odor of menthene.

554,938—February 18, 1896. L. LEDERER. *Process of obtaining phenols.*

Substances containing phenols, as crude cresols, etc., are subjected to the action of choloracetic acid in the presence of soda lye. The alkaline salt produced is then treated with a suitable dilute mineral acid to produce free phenoxacetic acids, which are treated with mineral acids to produce phenols.

563,975—July 14, 1896. L. LEDERER. *Process of obtaining oxybenzylic alcohol.*

An aromatic phenol is caused to react with formic aldehyde in the presence of a nonacid condensing agent: the free phenol is removed by steam, and the oxybenzylic acid extracted with ether.

574,421—January 5, 1897. L. O. HELMERS. *Process of obtaining aqueous solutions of phenols.*

A new product, of a viscid brown color, smelling of phenol, consisting of a phenol and the sulphonic-acid compound of ichthyol or thiol (a chemical combination of a sulphureted hydrocarbon compound, containing at least 5 per cent of sulphur and sulphuric acid) and soluble in water, is produced by the reaction of the said constituents in a solvent, and evaporation.

577,302—February 16, 1897. A. HESSE. *Terpene alcohol.*

A new product, $C_{10}H_{20}O$, (b. p. at air pressure 226° C.), noncombining with calcium chloride, is produced from volatile saponified oils, particularly African, Reunion, and other geranium oils, by heating with an acid anhydrid, removing the nonalcoholic ingredients by distillation with steam, saponifying the residual esters with alkalies, also under pressure, and distilling the terpene alcohol with steam.

607,494—July 19, 1898. G. TOBIAS. *Process of making pyrocatechin.*

Salts of the phenoltrisulpho-acid are heated with caustic alkali to above 200° C., and the alkaline salt of the pyrocatechindisulpho-acid thus obtained is heated with water in a closed vessel to about 160° C. for several hours.

625,480—May 23, 1899. H. VIETH. *Process of rendering ichthyol odorless.*

Ichthyol compounds are distilled with steam under a pressure less than an atmosphere.

651,061—June 5, 1900. A. WEINBERG. *Diamidonaphthol.*

A new diamidonaphthol, having the constitution $NH_2:NH_2:OH=2:8:7$, melting at 220° C. while decomposing, is produced by the combination of the 2-7-amidonaphthol with diazo bodies in an alkaline solution, and reduction of the thus obtained azo dyestuffs.

ALDEHYDES AND THEIR PRODUCTS.

483,290—September 27, 1892. I. ROOS. *Process of making salicylaldehyde-alpha-phenylmethyl hydrazone.*

A new compound, being a white crystalline powder, insoluble in water, of m. p. 73° C. It is produced by combining salicylaldehyde and alphamethylphenyl hydrazine in a solvent, such as methyl alcohol.

504,626—September 5, 1893. J. SCHMID. *Medical compound.*

A new compound, crystallizing in yellowish flat needles, m. p. 90°–91° C., and insoluble in water, is produced by the action of salicylaldehyde on paraphenetidin.

543,193—July 23, 1895. A. SCHMIDT. *Production of protocatechuic aldehyde-meta-alkyl ethers.*

A new group, as protocatechuic aldehyde-meta-ethyl-ether, which crystallizes out of water in small glittering scales and has a m. p. of 77.5° C., is produced by the reaction of a compound of the type of benzenesulpho chloride upon a mono-metallic salt of protocatechuic aldehyde, alkylating a salt of the so-formed compounds of the type of para-benzene-sulphoprotocatechuic aldehyde, and splitting off the ether product from the compounds of the type of para-benzene-sulphoprotocatechuic aldehyde-meta-alkyl ether obtained in that way by means of saponification agents, such as potassium or soda lye.

545,099—August 27, 1895. A. SCHMIDT. *Protocatechuic aldehyde-meta-alkyl ethers and process of making same.*

The ethers are produced by causing a suitable compound of the type of benzyl chloride to act upon a mono-metallic salt of protocatechuic-aldehyde, alkylating a salt of the so-formed compounds of the type of para-benzyl-protocatechuic-aldehyde, and separating from the product the protocatechuic-aldehyde-meta-alkyl ether by decomposition, as by hydrochloric or hydrobromic acid.

575,237—January 12, 1897. B. HOMOLKA. *Process of manufacturing aromatic aldehydes.*

Monobenzylanilin, its homologues or nitro products, is oxidized in the presence of a dilute mineral acid, such as an acidulated bichromate solution.

581,053—April 20, 1897. F. ACH. *Process of obtaining cinnamic aldedyde.*

Benzaldehyde and acetic aldehyde are dissolved in alcohol, cooled to 10 C., and treated with concentrated soda lye with agitation.

598,914—February 15, 1898. E. H. C. DÜRKOPF. *Formaldehyde tannin.*

New compounds, methylene-di-tannins—as methylene-di-gallotannic acid, $C_{29}H_{20}O_{18}$,—a reddish-white light powder, decomposing at 230° C.—are produced by reacting upon tannin with formic aldehyde in the presence of a condensing agent, as hydrochloric acid, the formic aldehyde being molecularly equivalent to one-half the amount of tannin.

601,072—March 22, 1898. E. H. C. DÜRKOPF. *Formaldehyde proteids containing iodin.*

New compounds, reddish-yellowish powders, liberating iodine on decomposition, are produced by allowing iodine or an iodine solution, as that of potassium iodide, to act upon a formaldehyde-proteid—as for instance casein—combination.

602,697—April 19, 1898. A. CLASSEN. *Formaldehyde starch and method of making same.*

New chemical compounds of formaldehyde and starch, not decomposed by heating to 180° C., are produced by heating the said substances together under pressure to about 100° C., the compounds obtained being again treated with formaldehyde, and excess of formaldehyde removed.

613,460—November 1, 1898. P. P. MONNET. *Process of making aromatic aldehydes.*

The methyl group in compounds of the aromatic hydrocarbon series is aldehydized by treating the compound, such as nitrotoluene, with an oxidizing agent, such as manganese binoxide (Weldon mud) and sulphuric acid, in such a proportion that the agent is insufficient for the oxidation of the total methyl to aldehyde, and then separating out the aldehyde produced.

636,994—November 14, 1899. B. HOMOLKA AND A. STOCK. *Process of obtaining ortho and para nitro benzaldehyde.*

Nitrobenzylidenanilinsulphonates, where the nitro group is in ortho or para position to the CH group, are made to react with the salts of a primary aromatic base, and the nitrobenzyliden bases thus obtained are treated with dilute mineral acid.

640,564—January 2, 1900. B. HOMOLKA AND A. STOCK. *Process of making amidobenzaldehyd.*

The elements of water are linked to the amidobenzylideneanilin compounds, and the mixture of aniline base and aldehyde thus obtained separated in the usual manner.

650,022—May 22, 1900. H. OPPERMANN. *Volatile chloral compound, and process of making same.*

Bromine is first treated with menthol, slowly and while keeping them cool, and then chloral is added.

VANILLIN.

151,119—May 19, 1874. W. HAARMANN. *Improvement in the manufacture of artificial vanillin.*

Artificial vanillin is produced by treating a solution formed of coniferin or the cambium of coniferous woods, with chromate of potassa and sulphuric acid, heating, distilling, and treating the residuum with ether.

192,542—June 26, 1877. F. TIEMANN. *Improvement in manufacture of vanillin.*

The process consists, first, in adding to an etheric solution of oil of cloves, hydrate of sodium (or potassium) and acidulating with sulphuric or hydrochloric acid, eliminating the ether by distillation; second, heating the eugenol so obtained with the addition of acetic anhydride, adding warm water to the cooled liquid, and permanganate of potassium, eliminating therefrom the manganese dioxide; third, adding an excess of hydrate of sodium to the filtered liquid, and evaporating; and, finally, adding sulphuric or hydrochloric acid to the concentrated solution, agitating the same with an addition of ether, and purifying the vanillin so obtained by any of the known methods.

457,863—August 18, 1891. G. DE LAIRE. *Process of making isoeugenol.*

Isoeugenol, for use in the production of vanillin, is made by heating eugenol or essence of cloves with hydrate of potassa and alcohol, expelling the alcohol with steam, and separating the isoeugenol by treating the mass with acid and decanting it. It is an oily substance, boiling at from 252° to 262° C.

457,864—August 18, 1891. G. DE LAIRE. *Process of making compounds of isoeugenol.*

Monomolecular derivatives of isoeugenol are obtained by heating a mixture of isoeugenol and an organic anhydride acid, as anhydrous acetic acid. Acetyl isoeugenol melts at 80° C., benzoyl isoeugenol at 104° C.

487,167—November 29, 1892. F. ACH. *Eugenol benzyl-ether and process of preparing same.*

A new compound, a colorless oil, solidifying in thick prisms, m. p. 29° to 30° C., is produced by dissolving eugenol in rectified spirits, adding caustic potash and benzyl chloride, heating the mixture, and then distilling off the spirits, and precipitating eugenol benzyl-ether with water. It is purified by shaking with dilute alkali and distilling in a partial vacuum.

487,204—November 29, 1892. F. ACH. *Process of preparing vanillin.*

The process consists in the following steps: First, dissolving eugenol in alcohol, adding thereto alkaline hydrate and a halogen compound of benzyl, and heating the mixture; second, dissolving the resulting eugenol benzyl-ether in alcohol, adding thereto alkaline hydrate, keeping the same at the boiling point for some time, then partially distilling off the alcohol, and adding water to the residue; third, adding to the resulting isoeugenol benzyl-ether a mixture of sodium chromate, sulphuric acid, and water; and, finally, adding hydrochloric acid to the resulting vanillin benzyl-ether.

Vanillin benzyl-ether, a new compound, has a m. p. of 63° to 64° C. and a formula of C_6H_3, CHO, OCH_3, $OCH_2C_6H_5$.

487,205—November 29, 1892. F. ACH. *Isoeugenol benzyl-ether and process of preparing the same.*

A new compound, crystallizing in fine felted needles, m. p. 58° to 59° C., and used in the preparation of vanillin, is produced by dissolving eugenol benzyl-ether in rectified spirits, adding caustic potash, keeping at the boiling point for from sixteen to twenty-four hours, and then partially distilling off the alcohol and adding water to the residue. The isoeugenol benzyl-ether is purified by pressing and recrystallizing from alcohol.

497,546—May 16, 1893. G. DE LAIRE. *Process of making vanilloyl-carbonic acid and vanillin.*

Crude vanillin is first treated with bisulphite of soda in water; alcohol is then added little by little until the latter takes up the vanillin salts; when the alcoholic and aqueous solutions are separated and the aqueous liquor is treated with sulphuric acid to set free the vanilloyl-carbonic acid, which is dissolved out with ether and the solvent evaporated. Vanilloyl-carbonic acid is heated above 134° C., its M. P., when it separates into vanillin and carbonic acid; the fused mass is dissolved in ether, agitated with an aqueous solution of carbonate of magnesia, and the ether which holds the vanillin in solution evaporated.

519,693—May 15, 1894. J. BERTRAM. *Process of making vanillin.*

Vanillin and its isomers are produced by treating the metallic compounds of protocatechuic aldehyde, such as sodium protocatechuic aldehyde, with haloid compounds of methyl, as methyl-iodide, or methyl sulphates.

553,039—January 14, 1896. M. OTTO AND A. VERLEY. *Process of obtaining vanillin, etc.*

A carbon compound, as isoeugenol, having a benzene nucleus with a lateral chain C_3H_5, in order to produce its corresponding aldehyde, as vanillin, is oxidized by ozone (as by passing a current of ozone through it), and the resulting aldehyde is then isolated.

553,583—January 21, 1896. M. OTTO AND A. VERLEY. *Manufacture of vanillin.*

See Group X, Electro-chemistry.

560,494—May 19, 1896. W. HAARMANN. *Process of obtaining vanillin.*

Isoeugenol is oxidized in a strong alkaline solution by means of a peroxide, as sodium peroxide.

561,077—June 2, 1896. F. ACH. *Process of obtaining vanillin.*

Vanillin benzyl ether is decomposed by treating it with an acid in the presence of an alcohol, then distilling off the alcohol, driving off the benzyl-ethyl-ether and separating the vanillin.

565,918—August 18, 1896. J. L. NOVARINE. *Process of obtaining vanillin.*

A solution of eugenol in a suitable solvent, such as a carbon bisulphide, is subjected to the action of a solution of chromylchloride, the dichlorochromyl-eugenic compound thus obtained is decomposed by water, the products extracted, and the vanillin isolated. The dichlorochromyl-eugenic compound, a new product, is a brown or greenish brown powder, more or less crystalline and easily decomposed by water.

565,919—August 18, 1896. J. L. NOVARINE. *Process of obtaining vanillin.*

A solution of eugenol, or its ether in glacial acetic acid, is subjected to the action of chromyl-chloride in the same solvent; the solution diluted with water; the products extracted, saponified, and the vanillin isolated.

571,917—November 24, 1896. C. BERGMANN. *Process of obtaining vanillin.*

Paraoxybenzaldehyde is changed into the meta-nitro and meta-amido combination, and the latter is then transformed into metamethoxy-paraoxybenzaldehyde (vanillin) by the action of nitrous acid in alcoholic solution.

572,890—December 8, 1896. C. GOLDSCHMIDT. *Vanillin paraphenetidin.*

A new compound, $C_{16}H_{23}O_6N$, yellow crystals, m. p. 97° C., soluble in water, insoluble in ether, is produced by acting upon vanillin with paraphenetidin.

575,070—January 12, 1897. B. R. SEIFERT. *Isohomovanillin.*

New aromatic substances of the formula $C_6H_2(OC_nH_{2n}+1)1(OH)2(CH_3)4$ (COH) 5, whereby the general group $C_nH_{2n}+1$ is limited to the special cases CH_3 and C_2H_5, soluble in soda-lye, ether, and alcohol, forming colorless or yellowish scales and needles, and being especially characterized by a vanilla-like scent and taste. They may be produced by the action of chloroform on isohomopyrocatechinether of the formula $C_6H_3(OC_nH_{2n}+1)1(OH)2(CH_3)4$ or by chloroform on an alkaline solution of isocresol with successive treatment of the product by acid, ether, and sodium bisulphite.

585,584—June 29, 1897. W. MAJERT. *Process of obtaining vanillin.*

An aqueous solution of isoeugenol sodium and a sodium salt of halogen nitrobenzene sulpho-acid is boiled, producing isoeugenol-phenylether nitrosulphate of sodium; the isoeugenol phenylether nitrosulphonic acid is oxidized to a salt of vanillin phenylether nitrosulphuric acid, and the vanillin separated by means of an alkali.

631, 756—August 22, 1899. F. ACH. *Process of making iso-eugenol and derivatives thereof.*

A new compound, mono-eugenol-phosphoric acid, m. p. when hydrated 105° C., is produced by treating eugenol in a neutral condition with phosphorous-oxy-chloride; making an alkaline solution of the product, and acidifying. Treated with alkali, iso-eugenol-phosphoric acid is produced, melting in a dehydrated condition at 133° C. An acid alkali salt is prepared from the last acid, dried and heated, producing iso-eugenol.

ETHERS.

516,766—March 20, 1894. F. KRAFFT AND A. ROOS. *Process of making ether.*

Sulphonic acids, or their ethers, are heated with alcohols producing ethers; as ethyl alcohol added to benzene-sulphonic acid and heated to 135° to 145° C. produces ethyl ether.

475,640—January 19, 1897. P. FRITZSCHE. *Process of obtaining ether.*

Gases containing ethylene, after removal of tar, ammonia, benzol, and hydrogen sulphide, are washed with dilute sulphuric acid to remove hydrocarbons of condensation, then treated with concentrated sulphuric acid at from 100° to 140° C., to absorb the ethylene, and, after dilution, to distillation; the vapors of ether, alcohol, and water, according to their alcohol and ether contents, being passed through ethyl sulphuric acid of varying degrees of dilution.

580,575—April 13, 1897. F. H. HÄHLE. *Catechol ether.*

Monoethyl ether of pyrocatechin, a new substance of the formula $C_6H_4.OH.OC_2H_5$ having a b. p. of 215° C., solidifying at 26° to 27° C., and crystallizing easily into colorless, bright transparent prisms. It is easily soluble in alcohol, in ether, and in diluted aqueous soda-lye, solidifying with concentrated soda-lye into a white salt having an agreeable aromatic smell resembling thymol.

ACIDS.

332,829—December 22, 1885. H. PRINZ. *Manufacture of beta-naphthylamine sulpho-acid.*

See Group XI, Dyestuffs, Artificial, Organic.

333,034—December 22, 1885. H. VOLLBRECHT AND C. MENCSHING. *Manufacture of color-producing acids.*

See Group XI, Dyestuffs, Artificial, Organic.

518,989; 518,990—May 1, 1894. H. A. FRASCH. *Petroleum sulfo-acid.*

See Group XI, Dyestuffs, Artificial, Organic.

563,382—July 7, 1896. F. KRECKE AND I. ROSENBERG. *Amidonaphtholdisulpho-acid K.*

See Group XI, Dyestuffs, Artificial, Organic.

569,419—October 13, 1896. H. LAUBMANN. *Dinitroanthrachrysone-disulphonic acid and method of making same.*

See Group XI, Dyestuffs, Artificial, Organic.

569,425—October 13, 1896. A. PIUTTI. *Paraethoxyphenylsuccinamic acid and method of making same.*

A new product, easily soluble in alcohol and acetic acid, crystallizing in lustrous colorless plates, m. p. 160°–161° C., is produced by heating succinic acid with paraphenetidin until formation of water ceases, dissolving the product in caustic soda, and precipitating by a mineral acid.

606,437—June 28, 1898. F. BENDER. *Amidonaphtholdisulpho-acid and process of making same.*

See Group XI, Dyestuffs, Artificial, Organic.

607,056—July 12, 1898. J. KOETSCHET. *Process of making aldehydo-benzoic acid.*

A new anilin salt, slightly soluble in water, m. p. 165° C., with evolution of gas, becoming on melting an insoluble body with m. p. above 250° C., is obtained by treating ortho-oxalyl-benzoic acid with anilin in aqueous solution. Anilido-benzylidene-ortho-carboxylic acid is obtained by boiling this new anilin salt with a neutral solvent, such as toluene or xylene, and the acid thus obtained is converted into aldehydo-benzoic acid by extracting with ether and vaporizing the ether.

616,123—December 20, 1898. I. LEVINSTEIN AND C. MENSCHING. *Process of making alphylamidonaphthol-sulfonic acids.*

See Group XI, Dyestuffs, Artificial, Organic.

621,679—March 21, 1899. M. H. ISLER. *Oxyanthraquinone sulfo acid and process of making same.*

See Group XI, Dyestuffs, Artificial, Organic.

625,637—May 23, 1899. H. A. MERNTHSEN. *Oxynaphthindophenolthiosulfonic acid and process of making same.*

See Group XI, Dyestuffs, Artificial, Organic.

ESTERS OR SALTS.

93,817—August 17, 1869. L. D. GALE AND I. M. GATTMAN. *Improvement in the manufacture of sugar of lead and acetic acid.*

See Group I, Acetic Acid.

172,999—February 1, 1876. J. W. HAAS. *Improvement in processes for manufacturing cream of tarter.*

Argols with hydrochloric acid, chloride of potassium, and water are treated in a closed vessel with superheated steam for about three hours and the solution then allowed to crystallize.

183,597—October 24, 1876. G. SCHNITZER. (*Reissue: 10,004—January 3, 1882.*) *Manufacture of cream of tarter.*

Argols with hydrochloric acid, chloride of potassium, and water are subjected to steam pressure for the necessary length of time, and the cream of tarter separated from the residual solution after it has crystallized. (Same as No. 172,999.)

217,235—July 8, 1879. E. MULLER. *Improvement in the manufacture of bitartrate of potassa.*

Hydrochloric acid is added to the solution of argols and water—one equivalent by weight of hydrochloric acid to the contained tartrate of lime—and after crystallization of the cream of tarter chalk is added to the mother water to precipitate the tartrates.

222,598—December 16, 1879. E. MUELLER. (*Reissue: 10,011—January 17, 1882.*) *Manufacture of cream of tartar.*

Argols are boiled in water, in the proportion of about 3 pounds to a gallon of water, under pressure of 60 pounds, by steam injected into the water and which is allowed to escape from the converter, the cream of tartar being separated by crystallization.

277,016—May 8, 1883. A. DREYFUS. *Apparatus for treating argols in the manufacture of cream of tartar.*

In the boiling of argols with steam under pressure, boneblack and china clay are successively introduced into the vessel after the boiling has commenced, but before the settling of the solution. The steam is permitted to partially escape during the boiling.

294,592—March 4, 1884. F. DIETRICH. *Manufacture of cream of tartar.*

Dissolved argols are treated with phosphoric acid or its compounds to precipitate iron and alumina, clarified and decolorized.

313,629—March 10, 1885. R. SILBERGER. *Manufacture of cream of tartar.*

The mother liquor obtained in the manufacture of tartaric acid from argols is treated with soda and potassium chlorate to obtain potassium bitartrate, and chlorate of sodium as a by-product.

335,485—February 2, 1886. E. SCHAAL. (*Reissue: 10,823—March 29, 1887.*) *Manufacture of resin-acid ethers,*

Raw resin acids are freed from volatile or soft constituents by distillation or extraction; the hard resin-acid residues are then condensed to ether by treatment with alcohols or phenol at a high temperature, with or without pressure or the addition of substances favoring the reaction, and finally the resin-acid ether is separated into softer and harder resin-like bodies by distillation *in vacuo.*

338,365—March 23, 1886. R. SCHMITT. *Manufacture of salicylic-acid compounds.*

The application of the process of No. 334,290 to the substituted phenolates results in the production of substituted salicylic salts, likewise without any separation of phenol.

348,483—August 31, 1886. H. VON PERGER. *Production of phenyl-methyl oxyquinicine.*

A new product; m. p. 122° C. It is produced by the action of hydrazobenzole upon acetylacetic ether.

350,012—September 28, 1886. M. V. NENCKI AND R. SEIFERT. *Production of salol.*

A new product; m. p. 43° C. It is produced by the action of oxychloride of phosphorous upon a mixture of salicylic acid and a phenol.

350,468—October 5, 1886. R. SCHMITT AND C. KOLBE. *Manufacture of naphthol-carbonic alkaline salts.*

They are produced by the action of dry carbonic acid at atmospheric temperature, either without pressure or with pressure, in conjunction with a cooling process, upon naphthol alkaline salts; the dry naphthol-carbonic alkaline salts thus obtained being converted into alpha or beta carbonaphthol-acid alkaline salts by heating in an hermetically closed vessel at from 120° to 140° C. Carbonaphthol-acid salts are produced direct by the reaction of carbonic acid upon the alkaline salts of alpha or beta naphthol under pressure at 120° to 145° C.

361,690—April 26, 1887. R. GNEHM. *Production of a new ethyl-ether.*

A new ethyl-ether, of the formula $C_{14}H_{24}N_2O_4$; m. p. 126° C. It is produced by the action of acetyl-acetic ether upon ethylenediamine.

366,885—July 19, 1887. E. SCHAAL. *Process of making ethers from petroleum.*

Liquid petrol acid, obtained from petroleum by the process of No. 335,962, is mingled with an alcohol, heated, and the petrol ethers, separated by distillation, are washed and purified.

377,311—January 31, 1888. C. KOLBE. *Manufacture of salicylic acid ester.*

Salol is produced from a mixture of salicylic acid and a phenol by passing a current of phosgene gas therethrough at a temperature of about 170° C.

383,306—May 22, 1888. C. KOLBE. *Manufacture of salicylic-acid esters.*

Salol is produced from a mixture of salicylic acid and a phenol, which may be melted or dissolved in a solvent—as benzole—by the action of trichloride of phosphorus.

391,248—*October 16, 1888.* P. W. HOFMANN. *Process of manufacturing salol.*

Salol is produced by heating phenolate of sodium in an atmosphere of phosgen gas. Salicylate of sodium, previously produced, may be mixed therewith.

439,805—*November 4, 1890.* A. MARTIGNIER. *Process of obtaining cream of tartar.*

Lyes, argols, tartars, and other tartarous matters are treated with an alkaline sulphate, as of soda or potash, the residuum separated from the liquid and cream of tartar precipitated from the latter with sulphuric acid.

453,035—*May 26, 1891.* J. BONGARTZ. *Guaiacol ether.*

A new product, the benzoic ether of guaiacol, having the composition $C_6H_4\left\{\begin{matrix}O.CO.C_6H_5\\O.CH_3\end{matrix}\right\}$ and m. p. 50° C. Crude guaiacol is converted into a salt, preferably its potassium salt, and purified, heated with benzoyl chloride and the benzoyl compound recrystallized from alcohol.

486,770—*November 22, 1892.* P. ERNERT. *Process of making salicylate of phenyl.*

Salicylic acid is heated at or about 230° C., with exclusion of air and vaporization of water.

492,868—*March 7, 1893.* H. JANSSEN. *Salicylic-acid compound.*

A new compound, crystallizing out of alcohol in small white scales, insoluble in cold water, m. p. 187° C., is produced by reacting upon paranitrophenol in the presence of dehydrating agents with salicylic acid, reducing the nitro phenylester of salicylic acid thus obtained, and treating the formed amido phenylester of salicylic acid with acetic acid anhydride, or acetyl chloride in such quantity as is necessary to replace one hydrogen atom of the amido group by an acetyl group.

495,497—*April 18, 1893.* A. LIEBRECHT. *Basic bismuth gallate.*

A new compound, a yellow powder, without odor, soluble in a large excess of mineral acids, and containing 55 per cent to 56 per cent of bismuth oxide—a suitable substitute for iodoform—is produced by dissolving neutral bismuth nitrate in dilute nitric acid, adding a solution of gallic acid in alcohol and water, and to the mixture adding caustic alkali, alkali carbonate or the like until the whole remains but slightly acid, and precipitating with acetate of soda or by diluting with water.

501,446—*July 11, 1893.* E. SCHAAL. *Manufacture of resin-acid esters.*

The aqueous vapors formed during the heating of a resin acid in the presence of an alcohol or hydroxyl derivative are drawn off by suction as soon as the formation of the esters begin, and the alcohols distilled off are replaced by a fresh supply until the formation of the product is completed.

503,743—*August 22, 1893.* F. GEROMONT. *Lactyl-paraphenetidid and process of making it.*

A new compound, of the formula $C_{11}H_{15}NO_3$, crystallizing in white needles, m. p., 117.5° C., and soluble in an abundance of water, is produced by heating the lactate of paraphenetidin to 130° to 180° C. until the resulting watery vapors are completely driven off. The said lactate is formed by dissolving paraphenetidin in dilute sulphuric acid, mixing with a solution of calcium lactate, precipitating the calcium sulphate with alcohol, filtering, and evaporating to dryness.

509,055—*November 21, 1893.* H. THOMS. *Salicylate of tolyldimethylpyrazolon.*

A new crystalline compound, having the formula $C_{12}H_{14}N_2O.C_7H_6O_3$, and m. p. 106.5° C., is produced by heating together aceto-acetic ether and orthotolylhydrazin, methylating the product, and combining therewith salicylic acid.

509,520—*November 28, 1893.* P. FRITSCH. *Salicylic ester of acetol.*

An alkaline salicyate, as salicylate of soda, is heated with mono-halogen-acetone and the alkaline chloride separated from the resulting acetol.

511,143—*December 19, 1893.* W. H. HIGGIN. *Process of making sodium acetate.*

Esparto-liquor and similar alkaline liquors are evaporated and the residue treated by regulated heat, so that the temperature shall exceed 200° C., but shall never reach the heat at which sodium acetate is decomposed (about 400° C.), thereby producing a mass of "char," which upon treatment with water yields a solution of acetate of sodium along with other matters.

253,018—*July 17, 1894.* C. STOEHR. *Dimethylpiperazin tartrate.*

A new compound, having the formula $C_6H_{14}N_2C_4H_6O_6$; a white powder when water free, easily soluble in water, insoluble in alcohol, and m. p. 242°-243° C.; is produced by combining tartaric acid and dimethylpiperazin in equal molecular proportions.

530,826—*December 11, 1894.* C. F. CROSS AND E. J. BEVAN. *Manufacture of cellulose acetate.*

A compound, or intimate mixture, of cellulose and zinc acetate is produced by mixing cellulose hydrate with zinc acetate solution, drying and dehydrating the compound. This product is treated with chloroform, whereby a solution of cellulose acetate is obtained free from cellulose, and the solvent is evaporated.

533,718—*February 5, 1895.* J. MEYER. *Tannin compound.*

A new compound, consisting of a mixture of mono-and diacetyl tannin, an amorphous light-yellow powder, soluble in alcohol and insoluble in water; is produced by heating tannin with a mixture of glacial acetic acid and acetic acid anhydride.

537,841—*April 23, 1895.* J. F. VON MERING. *Process of making ethers of para-oxyphenylurethane.*

New compounds, acidyl combinations of the para-oxyphenylurethans, crystallizing readily, are produced by heating para-oxyphenylurethan with an acidyl reagent.

541,489—*June 25, 1895.* J. F. VON MERING. *Acidyl compound of para-oxyphenylurethan ethers.*

New compounds, readily crystallizable and more or less soluble in alcohol and benzene, are produced by heating the ethers of para-oxyphenylurethans with reagents containing the acidyl group, as acetic acid anhydrid.

541,899—*July 2, 1895.* B. THIEME. *Process of making nitropentaerythrit.*

The pentaerythrit produced by condensation in the presence of lime of acetaldehyde and formaldehyde, is treated with concentrated nitric and sulphuric acids.

544,104—*August 6, 1895.* F. LÜDY. *Bismuth oxyiodidgallate and process of preparing same.*

A new product, a grayish-green amorphous powder, insoluble in water and ordinary solvents and decomposing slowly in moist air, is produced by the reaction of gallic acid upon bismuthoxyiodid.

549,728—*November 12, 1895.* F. KRAFFT AND A. ROOS. *Process of making esters.*

Esters are produced by the action of an alcohol and a carbon acid at a temperature above 100° C., in the presence of an aromatic sulphonic acid.

558,197—*April 14, 1896.* A. MÜLLER-JACOBS. *Process of manufacturing tannate of zirconium.*

A hot saturated solution of tannic acid is slowly added to a hot solution of a soluble salt of zirconium, and the precipitate is washed and dried.

561,730—*June 9, 1896.* B. R. SEIFERT. *Substituted salol.*

New compounds, solid, crystalline, colorless, without smell, soluble in alcohol, insoluble in water, and M. P. from 55° to 170° C., are produced by heating a mixture of a substituted phenol and salicylic acid to 140° C.; adding a dehydrating agent as phosphorous pentachloride; continuing the heating until generation of hydrochloric acid ceases; and then washing and recrystallizing from alcohol.

562,193—*June 16, 1896.* M. OTTO AND A. VERLEY. *Process of obtaining ether.*

The acid ethers of geraninol are produced by heating the natural essences which contain this alcohol with the chlorides of organic acids, as butyric chloride, and an alkaline metal, as sodium, in the presence of a neutral solvent, and separating the ether by distillation. The acid ethers are transformed into new perfumes by partial saponification by heating in an aqueous solution of calcium carbonate for some days in a closed vessel.

563,993—*July 14, 1896.* G. A. WELTER. *Amidoalkylsalicylic acid.*

It is produced by treating nitroalkylsalicylic acid with reducing agents, such as tin and hydrochloric acid. When the product is treated with an acetyl compound, such as glacial acetic acid, acetylamidoalkylsalicylic acid is produced; a new compound, characterized by antipyretic and antineuralgic properties.

569,415—*October 13, 1896.* O. HINSBERG. *Antipyrin mandelate and method of making same.*

A new product, m. p. 52° C., soluble in nearly all solvents and separating out as an oil, and solidifying as an opaque powder, is produced by the reaction of antipyrin with phenylglycollic acid.

569,429—*October 13, 1896.* R. SCHIFF. *Salicylic compound and method of making same.*

A new white crystalline product, a compound of salicylic acid and hexamethylenetetramin, easily soluable in alcohol and water, M. P. 95° C., is produced by simultaneously dissolving the constituents in benzene while heating the mixture and crystallizing.

571,352—*November 17, 1896.* E. FISCHER. *Method of obtaining tetra-alkyt uric acid.*

The salt of a dialkyl uric acid is treated with a haloid ether in an indifferent or inert diluting agent, such as ethyl ether, as by warming an alkaline solution of, a dimethyl uric acid with a solution of potassio-tartrate of copper in excess, then treating the resulting cuprous salt of dimethyl uric acid, mixed with powdered glass, with a haloid ether.

572,345—*December 1, 1896.* H. T. JARRETT. *Process of making potassium bitartrate.*

Argols are first dissolved in a solution of caustic soda and its carbonate to the point of neutralization, one-tenth of the weight of argols added in potassium chloride, filtered, a decolorizing agent added, and the potassium bitartrate precipitated directly from the mixture by an acid.

575,227—*January 12, 1897.* A. GALLINEK AND E. COURANT. *Process of manufacturing esters of diiodosalicylic acid.*

New products, as the alkyl ester of the diiodosalicylic acid, a white crystalline compound, m. p. 132° C., of the formula $C_6H_2I_2{<}\begin{matrix}OH\\COOAlk\end{matrix}$, are produced by subjecting salicylic acid esters to the action of iodine in the presence of a compound, as mercury oxide, which combines with the hydroiodic acid formed.

580,575—*April 13, 1897.* F. H. HÄHLE. *Catechol ether.*

A new product, monoethyl ether of pyrocatechin, m. p. 26°-27° C., b. p. 215° C., solidifying with concentrated soda-lye into a white salt, is produced by the ethylization of pyrocatechin by means of caustic soda and sodium ethyl sulphate.

580,630—*April 13, 1897.* G. WENDT AND J. LEHMANN. *Valeric esters of creosote.*

New products, slightly yellow oily liquids, soluble in alcohol, b. p. 260° C., and in vacuum between 117° and 121° C., are produced by boiling a mixture of the main constituents of creosote—creosol and guaiacol, respectively—with valerianic acid.

580,744—*April 13, 1897.* G. H. WEISS. *Carbonyl metadiamido salicylic acid.*

A new product, crystallizing in white laminæ, m. p. 252° C., soluble with difficulty in water and alcohol, is produced by treating nitroamido salicylic acid with phosgene and reducing the product. The diazo compound forms azo dyestuffs which are easily mordanted.

581,833—*May 4, 1897.* L. SELL. *Salicin compound and process of making same.*

An extract from the fruit of the *Aesculus hippocastanum* in combination with salicin, saligenin, glucose, and free hydrochloric acid, a stable, grayish-yellow powder freely soluble in water; is produced by subjecting salicin incorporated in the vegetable extract to the action of hydrochloric acid, and then adding more salicin.

585,068—*June 22, 1897.* A. WELLER. *Quinin-carbonic ether and process of making same.*

New products, derivatives of the levogyrate alkaloids of cinchona bark, tasteless, soluble with difficulty in water, readily soluble in chloroform and in acid; are produced by the action on the said alkaloids with an ether of chlorocarbonic acid.

588,412—*August 17, 1897.* E. FISCHER. *Trimethylbenzyl-uric acid and process of making same.*

New compounds, as trimethylbenzyl-uric acid, m. p. 171° to 173° C., crystallizing from alcohol in large crystals, insoluble in alkalis, are produced by treating a trialkyl-uric acid together with an alkali, with a haloid ether.

591,483—*October 12, 1897.* G. MERLING. *Compound of gamma-oxypiperidincarboacids and process of making same.*

New products, containing acidyl as well as alkyl groups, mostly colorless crystals, nearly insoluble in water, adapted to combine with inorganic and strong organic acids, are produced by combining triacetonamin and its analogous combinations, as, for instance, benzaldiacetonamin-vinyl-diacetonamin, with hydrocyanic acid, and then saponifying the so-obtained cyanhydrins (nitryls) Gamma-oxypiperidin-carbo acid is heated with both acidyl and alkyl reagents.

599,123—February 15, 1898. H. ENDEMANN. *Glycerol ether of aromatic compounds.*

New products, the glycerin ethers of aromatic substances containing oxygen in the form of hydroxyl, such as guaiacol, and which split and liberate a phenol-like substance and glycerin, are produced by combining the phenol-like substance with sodium hydrate and causing same to act upon monochlorhydrin in molecular proportions, generally at 140° to 150° C.

602,646—April 19, 1898. C. F. M. SCHAERGES AND P. SCHWARZ. *Process of making alkaline acetosulfanilate.*

A new product, soluble in water, is produced by acetylizing an alkaline salt of sulphanilic acid by means of glacial acetic acid, and removing free sulphanilic acid and alkaline acetate with water and alcohol.

602,834—April 26, 1898. O. DOEBNER. *Condensation product from salicylic and gallic acids.*

A new compound, $C_{14}H_{10}O_7$, a white amorphous powder, is produced by the reaction of phosphorous oxychloride on a equimolecular mixture of salicylic and gallic acids, which may be in the presence of a solvent and diluent, as toluene; subsequently removing the formed metaphosphoric acid by pouring the mixture on ice water and then washing and drying.

605,246—June 7, 1898. E. DÜRKOPF. *Bismuth methylene-di-gallate and process of making it.*

A new chemical compound, characterized by a voluminous powdery form, a blue-gray color, insoluble in water, and soluble in alkaline solutions with an orange color, is produced by precipitating bismuth hydroxid from a bismuth salt by an aqueous solution of ammonia, washing the precipitate, and acting upon it by methylene-di-gallic acid and water by gradual addition and slow digestion at a slightly elevated temperature.

606,930—July 5, 1898. L. LEDERER. *Process of obtaining hydroxylized phenyl ethers.*

Mixtures of hydroxylized phenyl ethers with phenols, such as wood-tar oils, guaiacol, etc., are mixed with potassium carbonate, and the resulting mixture is then treated with ether.

607,172—July 12, 1898. K. HOCK. *Pharmaceutical compound and process of making same.*

A new condensation product is produced by the reaction of cold concentrated solutions of one molecule of hexamethylenetetramin and of three molecules of tannin. The precipitate, of a yellowish-brown color, is rendered insoluble, odorless, and tasteless, by heating in a porcelain pan until it forms a hard lump.

610,348—September 6, 1898. A. EINHORN. *Ester of paraämidometaoxybenzoic acid.*

Obtained by heating paraämidometaoxybenzoic acid in alcoholic solution with mineral acids; a white crystalline product, m. p. 120° to 122° C.; useful as an ointment.

614,991—November 29, 1898. P. SCHIDROWITZ AND O. ROSENHEIM. *Piperidyl carbamate of piperidin and process of making same.*

A new product, $C_{11}H_{22}N_2O_2$, white, crystalline, soluble in water, alcohol, etc., m. p. 79° to 80° C., is produced by treating piperidin dissolved in a solvent, as acetone, with carbonic acid.

615,051—November 29, 1898. P. SCHIDROWITZ AND O. ROSENHEIM. *Piperidin salts and process of making same.*

New products, dicarboxylic salts of piperidin, having the form of prismatic plates and soluble in water, as tartrate of piperidin, $C_9H_{17}NO_6$, m. p. 136° to 137° C., are produced by treating piperidin with a dicarboxy fatty acid, such as tartaric acid.

615,307—December 6, 1898. H. REINHARDT. *Orexin tannate and process of making same.*

A new product, an odorless, tasteless, white, or slightly yellow powder, insoluble in water, is produced by mixing an aqueous solution of orexin hydrochlorate with an aqueous solution of tannin at 45° to 50° C., and precipitating with an aqueous solution of sodium acetate.

616,656—December 27, 1898. E. FISCHER. *Process of obtaining alkyl-uric acid.*

The ester of an acid possessing considerable electrical conductivity, such as nitric acid, is added to a solution of uric acid proper with an alkali; the solution is heated under pressure and with agitation, and after adding hydrochloric acid to the hot solution it is cooled and crystallized.

616,700—December 27, 1898. E. FISCHER. *Alkyl derivatives of uric acid and process of making same.*

New compounds, mixed alkyl derivatives of uric acid, as dimethyl-benzyl-uric acid, $C_5(CH_3)_2(C_6H_5CH_2)O_3$, m. p. 282° to 283° C., soluble only in alcohol, are produced by acting upon a mixture of an alkali solution and uric acid with a haloid ether; cooling and separating the monoalkyl derivative of uric acid; then acting upon a mixture of the said derivative and an alkali solution with a haloid ether; cooling; adding more alkali, etc., whereby the tetraälkyl derivative is obtained.

619,549—February 14, 1899. A. EINHORN. *Glycocol ester and process of making same.*

New products, as the methyl ester of diethyl-glycocol-para-amidosalicylic acid, a thick colorless oil, soluble with difficulty in water. They are produced by treating amidocarbonic-acid esters with halogen-substituted acid chlorides and allowing an amin to act upon the resulting halogen-alkyl derivatives.

620,141—February 28, 1899. H. JANSSEN. *Bismuth compound and process of making same.*

A new compound, a brown powder, insoluble in benzene and ligroin, dissolving partially in alcohol under decomposition, is produced by heating a mixture of bismuthoxyiodide and dibromgallic acid at 60° to 80° C. until development of carbon dioxide has ceased.

620,563—March 7, 1899. R. BLANK. *Process of obtaining indoxylic compounds of amido malonic esters.*

The aromatic amido malonic acid esters are heated to 200° to 270° C. until one molecule of alcohol is eliminated.

621,804—March 28, 1899. E. FISCHER. *Alkyl derivative of uric acid and process of obtaining same.*

A sufficient amount both of an alkali and a haloid-ether, such as methyliodid, is added to uric acid proper to make the ratio each of the reagents to the uric acid proper as 4 to 1, whereby tetra-alkyl-uric acid and trialkyl-uric acid are directly obtained.

621,805—March 28, 1899. E. FISCHER. *Process of making alkyl derivatives of uric acid.*

Uric acid is reacted on with an alkali and a haloid ether, as potash lye and methyl iodide, under heat and agitation, in the proportions of two molecules each of the alkali and the haloid ether to one of the uric acid.

622,456—April 4, 1899. H. C. FEHRLIN. *Process of manufacturing salol.*

Basic salicylate of soda with the necessary quantity of phenol is treated with phosphorus oxychloride at from 120° to 140° C. The product is then treated with carbonate of soda, and salol distilled off with steam.

623,789—April 25, 1899. E. KAUDER. *Process of making alkyl-ethers of morphine.*

A neutral alkyl-ester of phosphoric acid is caused to act on a suitable solution of morphine whose replaceable hydroxyl-hydrogen has been replaced by a metal whose hydroxide possesses alkaline reaction.

624,772—May 9, 1899. A. EINHORN. *Glycocolphenolester and process of making same.*

Glycocolphenolesters of the general formula alphyl—O—$COCH_2$—NX_2, wherein NX_2 represents the residue of a secondary amin, are produced by mixing halogen-aceticacidphenolesters with secondary amins, as by mixing chloracetylguaiacol with diethylanin, forming thick oils easily soluble in alcohol, ether, and benzine, little soluble in water, and with acids forming salts soluble in water, and which act as powerful antiseptics.

625,153—May 16, 1899. A. EINHORN. *Esters of para-oxy-meta-amidobenzoic acid and process of making same.*

A new product, a white crystalline compound, m. p. above 100° C., is produced by the action of mineral acids upon the alcoholic solutions of para-oxy-meta-amidobenzoic acid.

625,159—May 16, 1899. A. EINHORN. *Glycocolamidocinnamic-acid ester and process of making same.*

Alkyl-amidoacetyl-meta-amidocinnamic-acid esters produced by first combining meta-amido-cinnamic-acid ester with chloracetylchloride and then with amins; an oil soluble in alcohol, ether, and benzene, with difficulty in water, forming with acids salts soluble in water, its chlorhydrate having the M. P. 165° C.

626,910—June 13, 1899. E. KAUDER. *Process of making alkyl ethers of morphine.*

A suitable alkaline solution of morphine is acted upon by a nitric-acid ester of the desired alkyl.

627,031—June 13, 1899. C. O. WEBER AND C. F. CROSS. *Method of making cellulose tetracetate.*

The reactions of acetylchloride and acetic anhydride on a mixture of cellulose and magnesium acetate are controlled by adding regulated quantities of nitrobenzene after the reaction has started.

629,433—July 25, 1899. A. EHRENBERG. *Process of making alkyl ethers of morphin.*

A neutral inorganic oxygen-acid-ester of an alkyl, as methyl sulphate, is caused to act upon an alkaline solution of morphine.

630,522—August 8, 1899. L. SELL. *Saligenin compound and process of making same.*

A new preparation of saligenin is produced by the reaction of same with a physiological tannic acid (a tannic acid that is not reconverted into gallic acid on boiling with dilute acids) in the presence of a dilute acid at an elevated temperature.

631,761—August 22, 1899. F. ACH. *Process of preparing alkyl-uric acid.*

An oxymethylene uric acid is dissolved in an acid, as hydrochloric acid, and reduced by tin, producing 7-methyl-uric acid.

631,762—August 22, 1899. F. ACH. *Process of making oxymethylene-uric acid.*

An alkaline solution of an oxymethelene-uric acid is treated with methyl-iodide.

632,605—September 5, 1899. C. O. WEBER AND C. F. CROSS. *Process of making cellulose esters*

Structureless cellulose is mixed with a salt of a fatty acid and the mixture treated with the acid chlorides and a minimum of 10 per cent of the anhydrides of the said acid.

636,384—November 7, 1899. F. HOFMANN. *Process of making carbonates of aromatic series.*

One of the chlorocarbonyl derivatives of the pyridin base series is first made to act on an aromatic phenol, and the so-formed carbonate is then separated from the reaction mixture.

639,174—December 12, 1899. F. HOFMANN. *Ethyl ether of salicylo-carbonic acid.*

A new product, a white crystalline powder, m. p. 95° C., is obtained by the action of the ethylic ether of chloro-carbonic acid having the formula $C_2H_5O.CO.Cl$, on salicylic acid in the presence of a suitable basic compound, such as dimethyl-anilin.

642,218—January 30, 1900. H. C. FEHRLIN. *Process of making salol.*

Alkaline and earthy alkaline salts of acid-phenyl-carbonic ether are subjected to the action of phosphorus oxychloride.

643,280—February 13, 1900. A. WELLER. *Salicylates of the yttrium group.*

New antiseptic products, consist of a metal of the yttrium group, as didymium salicylate, obtained from the double earth didymium in the form of a pale pink powder, insoluble in water, of the formula $Di_2(C_6H_4(OH)COO_6)$.

646,631—April 3, 1900. A. WELLER. *Phenol ether of quinin carbonic acid.*

A further series of new products is produced according to the process of No. 585,068, a phenyloxy group taking the place of the alkyloxy group.

647,263—April 10, 1900. B. HEYMANN. *Ester of acetylphenylglycinortho carbonic acid.*

New compounds, yielding an indigo leuco compound when heated with dry caustic alkalis. They are produced by subjecting the neutral esters of phenylglycinortho carbonic acid to the action of acetylizing agents.

648,580—May 1, 1900. A. BÉHAL. *Process of making ethereal salts of formic acid.*

Equimolecular proportions of formic acid free from water and the anhydride of another organic acid are mixed at a moderate temperature.

650,408—May 29, 1900. E. MENNEL. *Process of making acidyl morphin esters.*

An alpha-mono-acidyl compound of morphine, whose acidyl constituent is of the fatty-acid series, is treated with a chloro-carboxylic ester and an alkali, producing a carboxy-alkylic ester of an acidyl-morphine.

KETONES.

275,128—April 3, 1883. J. BRONNER. *Method of purifying impure anthrachinone and alizarine.*

The solvent is vaporized and the vapor condensed and percolated through the mass, the quantity of solvent used being such as to retain the soluble impurities in solution as well as the pure anthrachinone, whereby the repeated evaporations, condensations, and percolations dissolve out the soluble impurities and the pure anthrachinone, the insoluble impurities being retained by filtration, and the soluble impurities are separated from the pure anthrachinone by the crystallization of the latter.

385,777—July 10, 1888. G. RUMPF. *Manufacture of acetone.*

An acetate is subjected to slow destructive distillation in a closed vessel at a low temperature (about 300° C.), with stirring and steam to prevent too high a temperature. The crude acetone is diluted to separate oily matters, treated with lime to remove higher ketones and other compounds, and rectified in a column still.

390,523—October 2, 1888. M. J. SCHREITER. *Process of refining camphor.*

Camphor is rectified by dissolving it with heat in camphor oil in such proportions that the camphor is separated as fine crystals; filtering the solution with animal charcoal, asbestos, or cellulose; and separating the remaining crystals by centrifugal force.

393,079—November 20, 1888. G. RUMPF. *Manufacture of acetone.*

An acetate is purified by passing it continuously through a system of externally heated tubes with stirrers, and is then subjected to destructive distillation to make acetone.

443,402—December 23, 1890. M. V. NENCKI. *Gallacetophenone.*

A new product, corresponding to $C_8H_8O_4$; m. p. 168° C. It is obtained by the action of pyrogallic acid with glacial acetic acid and zinc chloride.

444,004—January 6, 1891. H. LÜTTKE AND L. SCHOLVIEN. *Salicylate of phenyldimethylpyrazolone.*

A new compound of the formula $C_{18}H_{18}N_2O_4$; m. p. 91.5° C. It is produced by heating—preferably under pressure—phenylhydrazine, acetyl, acetic ether, and methyl-salicylic ether in the presence of a haloid hydric acid.

460,186—September 29, 1891. L. SCHOLVIEN. *Process of making dimethylphenylpyrazolone.*

Molecular quantities of methylphenylpyrazolone and sodium methyl sulphate are heated under pressure, with hydriodic acid and alcohol as a diluent.

464,861—December 8, 1898. G. EBERT. *Process of making phenylethylmethylpyrazolone.*

A new product, a homologue of antipyrine, of the formula $C_{12}H_{14}N_2O$; m. p. between 71° and 72.5° C. It is obtained by heating phenylmethylpyrazolone with iodethyl; decomposing the product by soda lye; taking up the oil with benzine; treating with hydrochloric acid and dissolving the hydrochlorate in alcohol; treating with ether, filtering and drying the product; then treating it with soda lye and separating and drying the oil as a final product, which sets in crystalline form.

503,066—August 8, 1893. H. THOMS. *Salicylate of para-tolyldimethylpyrazolon.*

A new compound, m. p. 101° C., not readily soluble in water, is produced by combining para-tolylhydrazin with acetic acid ether, heating, methylating the resulting para-tolylmethylpyrazolon, and melting the product with salicylic acid in equi-molecular proportions.

516,707—March 20, 1894. L. KNORR. *Paratolyldimethylpyrazolone.*

Paratolyldimethylpyrazolone of the formula $C_{12}H_{14}N_2O$, m. p. 137° C., crystallizing in colorless prisms soluble in water, of difficult solubility in ether, is produced by condensing paratolyl hydrazin with acetyl acetic ether, separating water and heating to eliminate alcohol, and methylizing the product of the condensation.

535,552—March 12, 1895. O. PORSCH. *Process of making acetone.*

Commercial acetate of lime mixed with calcium hydrate in excess is subjected to distillation under addition of superheated steam and constant agitation to separate the acetone vapors from the carbonated lime. The condensed vapors mixed with water are allowed to stand to separate out tar oils and sediments, and are then purified by fractional distillation and rectification.

548,352—October 22, 1895. A. BOEGLIN. *Antipyrin compound.*

A new medicinal compound, $(C_{11}H_{12}N_2O)_3 Fe_2 Cl_6$, brittle, nonhygroscopic crystals, of a reddish-brown color, soluble in water and m. p. 225° C., is produced by the combination of aqueous solutions of antipyrine and ferric chloride.

556,943—March 24, 1896. J. C. W. F. TIEMANN. *Aromatic ketone and process of making same.*

A new product of the formula $C_{13}H_{20}O$, insoluble in water, soluble in alcohol, is produced by treating a mixture of citral and acetone with alkaline agents, dissolving the product in ether, purifying by fractional distillation, and converting into a fragrant isomeric ketone by dilute acids and subsequent fractional distillation.

559,635—May 5, 1896. J. C. W. F. TIEMANN. *Process of making ketone from orris-root.*

A new product, $C_{13}H_{20}O$, insoluble in water, soluble in alcohol, etc. It is produced by distilling orris-root extract in a current of steam; treating the distillate with alkali and subsequent distillation; treating with oxidizing agents to eliminate the alkali; treating the resulting ketone with phenylhydrazin; and separating the pure fragrant ketone with a dilute acid.

574,725—January 5, 1897. J. R. FRANCE. *Process of purifying camphor.*

Crude camphor is dissolved in a hydrocarbon of less sp. gr. than water, as naphtha; the supernatant solution of pure camphor is drawn off, filtered, the solvent distilled off, and the pure anhydrous granular camphor crystallized.

579,412—March 23, 1897. F. STOLZ. *Pyrazolon compound and process of making same.*

A new product, the phenyl 2.3 dimethyl 4 dimethylamido 5 pyrazolon, a white crystallized compound, easily soluble in water and alcohol, m. p. 107°–108° C., with m. p. of its salicylate of 69° C., is produced by methylating 1 phenyl 2.3 dimethyl 4 amido 5 pyrazolon.

582,221—May 11, 1897. O. NAGEL. *Process of making artificial camphor.*

Hydrochlorinated terpene, $C_{10}H_{16}HCl$, is first produced by saturating anhydrous turpentine with anhydrous hydrochloric-acid gas while both are cooled by ice. The resulting crystals are then treated with lime to remove chlorine, and oxidized by nitric acid, producing camphor, $C_{10}H_{16}O$.

583,719—June 1, 1897. J. C. W. F. TIEMANN. *Process of making aromatic ketones.*

Citral and the homologues of acetone are treated with an alkaline condensing agent to form new ketones (methylized, ethylized, etc., ketones), which are then converted, by means of acids, into ketones isomeric with those first formed.

583,720—June 1, 1897. J. C. W. F. TIEMANN. *Fragrant ketone.*

The process of No. 583,719 is applied to citronellone, an aldehyde containing two atoms more of hydrogen than citral.

608,019—July 26, 1898. A. BAUSCHLICHER. *Process of and apparatus for making acetone.*

A dry mixture of acetate of lime and calcium hydrate is treated with superheated steam under continuous stirring and constant temperature to separate the acetone vapors, which are condensed and rectified; the crude acetone mixed with water in excess, settled, and rectified. The secondary products, or acetone oils, are injected into water under pressure and the mixture rectified.

610,361—September 6, 1898. O. MANASSE. *Oxycamphor and process of making it.*

A new product, $C_{10}H_{16}O_2$, white, crystalline, m. p. 203° to 205° C., volatile with steam vapor, and having a weak pepper-like taste, is produced by dissolving camphoquinone in acetic acid, adding zinc dust until the yellow color disappears, then treating with soda lye, and then with ether, and evaporating the ether.

610,664—September 13, 1898. W. SCHMIDT. *Process of refining camphor.*

Crude camphor is dissolved in a closed chamber in a solvent that does not mix with water and of less sp. gr., as benzine or naphtha, the supernatant solution being withdrawn and filtered in a closed filtering chamber, the solvent distilled off, and the pure anhydrous camphor crystallized.

628,293—July 4, 1899. R. WILLSTÄTTER. *Tropin ketone and process of making same.*

New products, ketones of tropin bodies, are produced by adding chromium trioxide in small installments to a tropin body, in the presence of acetic acid, with agitation; the amount just equaling two-thirds of the molecular equivalent of the tropin body; then heating to 100° C., cooling, neutralizing the acid with fixed alkali, and separating.

648,389—May 1, 1900. H. O. CHUTE. *Process of making acetone.*

The pulverulent material is continuously conveyed in a thin film or layer over a heated surface maintained at the proper temperature, and the acetone is removed by a current of oxygen-free gas moving in the opposite direction, under a partial vacuum, the gas being reheated and reused.

650,347—May 22, 1900. A. VERLEY. *Process of making ozonized terpinol.*

Ozone is caused to act upon terpinol and the ozonized terpinol is isolated with ether.

SULPHUR COMPOUNDS.

318,662—May 26, 1885. E. W. R. SCHRÖTER. *Topical remedy.*

Icthyolsulphur acid, a new product, applicable for medicinal uses, is an oil containing sulphur and sulphuric acid chemically combined, formed by the action of sulphuric acid on an oil containing sulphur.

319,082—June 2, 1885. C. FAHLBERG. (*Reissue: 10,667—December 1, 1885.*) *Manufacture of saccharine compounds.*

A new saccharine compound, benzoic sulphinide, of the formula $C_7H_5O_3SN$; sweeter than cane sugar; m. p. 200° C. It is made from the derivatives of coal-tar by converting toluene into toluene-sulphonic acid, oxidizing said acid or its salts into sulphobenzoic acid or its salts, then evaporating the latter and treating it with phosphorpentachloride and caustic or carbonate of ammonia, and finally separating the pure saccharine from the ammonia salts thus obtained.

Toluene is regenerated and hydrochloric and sulphurous acids generated at the same time from the solid toluene-mono-sulphochloride by the action of carbon, water, and superheated steam under pressure. Chlorine is generated for the preparation of phosphor-pentachloride from phosphor-oxychloride, bleaching powder, and water, respectively, hydrochloric and phosphoric acids, or one of them.

391,875—October 30, 1888. E. A. BAUMANN. *Medical compound.*

Diæthylsulphondimethylmethan, a new product of general composition of $C_7H_{16}S_2O_4$; m. p. 126° C., b. p. 300° C. It is formed by the oxidation of acetonæthylmercaptol with an aqueous solution of potassium permanganate.

393,388—November 27, 1888. E. OSTERMAYER. *Production of iodized sulpho-acids of phenols, etc.*

Iodinized phenol, cresol, or thymol sulpho-acids are produced by treating the respective sulpho-acids or their salts with iodine or a salt of iodine in presence of an oxidizing agent.

396,526—January 22, 1889. E. BAUMANN. *Sulphur compound.*

Diethylsulphonemethylethylmethane, a new product, of the formula $C_8H_{18}S_2O_4$; m. p. 76° C. It is produced by the oxidation with potassium permanganate to a sulphone of a new mercaptol formed from a mixture of methylethylketone with ethylsulphohydrate, with addition of hydrochloric acid.

401,500—April 16, 1889. F. KRÜGER. *Medical compound.*

A new product having the formula $C_6H_5CH(SO_2C_2H_5)_2$, m. p. 133° C., which is formed by the oxidation of the ethylmercaptol of the benzaldehyde $C_6H_5CH(SO_2H_5)_2$ by means of permanganate of potassium.

401,501—April 16, 1889. F. KRÜGER. *Medical compound.*

A new product, tetramethyl-disulphonmethane, having the formula $(CH_3)_2C(SO_2CH_3)_2$, m. p. 120° C., is produced by the action of gaseous hydrochloric acid on a mixture of methylmercaptan and acetone well cooled, the methylmercaptol formed being transformed into the disulphonate by oxidation with permanganate of potassium.

431,472—July 1, 1890. M. LANGE. *Process of making thio-oxydiphenylamine.*

A new product, useful as a medicament: m. p. 155° C. It is formed by heating together a salt of metaoxydiphenylamine, water, and sulphur. The reaction is promoted by adding an alkali or alkaline carbonate in excess.

442,094—December 9, 1890. E. A. BAUMANN. *Sulpho compound.*

A new product, diethylsulphone-diethyl-methane, of the formula $C_9S_2O_4H_{20}$; m. p. 87° C. It is obtained by the action of diethylketone with ethyl-mercaptan in the presence of hydrochloric acid, the product being oxidized with permanganate.

495,124—April 11, 1893. A. SPIEGEL. *Sulphur compound.*

Hydrocarbons, such as mineral oils, are first treated with caustic soda, then with sulphuric acid, the product then washed with water and brine successively, neutralized with alkaline lye, and the salt and sulphones separated by treatment with a solvent of the sulphones.

495,343—April 11, 1893. E. JACOBSEN. *Sulphur compound of hydrocarbon.*

New compounds, being neutral hydrocarbon bodies, nonhygroscopic, of a foliated or pulverulent form, soluble in water, nearly devoid of taste or smell, and consisting of unsaturated paraffins, or mixtures containing unsaturated paraffin, combined with sulphur, are produced by combining sulphur by means of heat with a hydrocarbon free from sulphur, treating with sulphuric acid, separating the crude soluble product, and purifying, neutralizing, and drying.

496,112—April 25, 1893. C. FAHLBERG. *Process of making pure saccharin.*

Saccharin, or anhydro-ortho sulphamin-benzoic acid, is purified by introducing the dry crude product—a mixture of the said acid with para sulphamin-benzoic acid—into an aqueous solution of an alkali, as caustic potash, containing such quantity of the alkali as will neutralize and dissolve only the said ortho-acid—e. g., 55 parts by weight of caustic potash for 185 parts of ortho-acid—filtering, and adding to the filtrate an acid, as a mineral acid, stronger than the ortho-acid, whereby pure saccharin is precipitated.

496,113—April 25, 1893. C. FAHLBERG. *Process of purifying saccharin.*

A solution of a mixture of the alkaline salts of anhydro-ortho sulphamin-benzoic acid and para-sulphamin-benzoic acid is treated with an acid, as hydrochloric or oxalic, which is stronger than the para-acid, in such quantity as is requisite to separate out the para-acid only; heated, cooled, and then filtered, when the ortho-acid, or pure saccharin, is precipitated from the filtrate by the addition of a stronger acid, preferably a mineral acid.

497,740—May 16, 1893. J. ZIEGLER. *Quinolin compound.*

A new antiseptic, oxyquinolin phenol sulphonate of oxyquinoline, soluble in water and forming amber-colored hexagonal crystals, is produced by digesting a mixture of phenol, oxyquinolin and sulphuric acid, then treating the so-obtained oxyquinolin-phenolete with a solution of sulphuric acid in water at a temperature near the boiling point.

513,204—January 23, 1894. E. W. R. SCHRÖTER. *Process of making pure sulfonic compounds.*

A hydrocarbon containing sulphur in chemical combination is treated with concentrated sulphuric acid; and the crude sulphonic compound obtained is several times treated with hydrochloric acid and the acid eliminated.

564,784—July 28, 1896. C. FAHLBERG. *Process of making saccharin.*

Toluene is treated with sulphuric acid, and the ortho and para toluene-sulphonic acids are converted into their magnesium salts by means of a magnesium salt. The greater part of the para-magnesium salt is separated from the ortho by crystallization of the former, and the ortho salt and the remainder of the para salt are converted into salts of sodium or potassium by treatment with carbonate of sodium or potassium and oxidized into the corresponding neutral ortho and para sulphobenzoates of sodium or potassium. The neutral salts are treated with acid, and the acid salts treated with alcohol and hydrochloric acid gas and converted into ortho and para ester-acids, which are neutralized with sodium carbonate and treated with phosphorous pentachloride to convert them into ester-benzosulphochlorides. These are transformed into their amids by ammonia and saponified into para-sulphaminbenzoates and a salt of saccharine, which is then separated out.

579,898—March 30, 1897. G. L. SCHAEFER. *Medical compound.*

New compounds, comprising an alkaloid base, such as quinine and guaiacol sulphonic acid, are produced by heating guaiacol with concentrated sulphuric acid, diluting, neutralizing with a carbonate or hydrate, as potassium carbonate, and treating the salt with a mineral acid, and thus forming guaiacol sulphonic acid and then dissolving the alkaloid therein.

584,471—June 15, 1897. L. O. HELMERS. *Water-soluble compound of ethereal oils.*

A new compound, consisting of an ethereal oil or a camphor and the sulphonic-acid compound of ichthyol and thiol—and the process applies to like insoluble substances—is produced by causing the constituents to react, said sulphonic-acid compound being soluble in water.

602,682—April 19, 1898. W. DIETERLE. *Process of producing orthotoluene sulfonic acid.*

Orthothiocresol is subjected to the action of an oxidizing agent, as potassium permanganate, producing orthotoluene sulphonic acid. A continuance of the oxidation converts the latter into orthobenzene sulphonic acid.

602,942—April 26, 1898. L. O. HELMERS. *Iodin derivative of ichthyol and thiol.*

A new compound, soluble in water, is produced by reacting upon iodine with a sulphonic-acid compound of a sulphureted hydrocarbon that is soluble in water.

622,854—April 11, 1899. B. HOMOLKA AND A. STOCK. *Nitrobenzyliden sulfonic acid and process of making same.*

New products, as the ortho or para-nitro-benzylidenanilin-sulphonic acids and their homologues, are produced by oxidizing the ortho or para-nitrobenzylanilin sulphonic acids or their homologues. They are soluble in water, with a yellowish color, insoluble in alcohol, ether, etc., and give, on decomposition with diluted mineral acids, nitrobenzaldehyde.

624,027—May 2, 1899. L. O. HELMERS. *Tasteless compound from sulfureted hydrocarbons, and process of making same.*

New products, pulverulent neutral salts, insoluble in water and devoid of taste and smell, consist of an alkaline-earthy and metallic base, and a sulphonic-acid compound derived from sulphureted hydrocarbons combined with sulphuric acid. They are produced by extracting the salts with a solvent, such as alcohol, adapted to dissolve only the bitter substances.

624,028—May 2, 1899. L. O. HELMERS. *Tasteless compound from sulfureted hydrocarbons, and process of making same.*

New products, sulphonic-acid salts of alkaline-earthy metals and metals proper derived from sulphureted hydrocarbons combined with sulphuric acid, devoid of taste and smell, are produced by heating the salts up to 130° to 140° C.

625,332—May 23, 1899. L. O. HELMERS. *Deodorized compound of mineral oils, and process of making same.*

Sulphonized compounds derived from sulphureted mineral oils by treatment with sulphuric acid are made odorless, or nearly so, by treating aqueous solutions thereof, while cool, with an oxidizing agent, and then concentrating by heating.

628,503—July 11, 1899. E. TWITCHELL. *Fatty aromatic sulfo compound and process of making same.*

A new compound, a sulpho-fatty-aromatic acid, a combination of the sulphonic radical with the stearic radical and one of the aromatic radicals of the general formula $R(HSO_3)C_{18}H_{35}O_2$, a stable, viscous, nonvolatile oil. It forms water-soluble salts with the alkali metals, and insoluble salts with the other metals, and is produced by mixing any member of the fatty-acid series with a member of the aromatic series and treating with sulphuric acid.

628,881—July 11, 1899. G. WENDT AND J. LEHMANN. *Process of making sulfo-acids of aliphatic creosotesters.*

The esters, under continuous stirring, are subjected to the action of concentrated sulphuric acid at below 150° C., the mixture allowed to stand for two hours, neutralized, and the sulpho-acids separated out.

646,772—April 3, 1900. A. VERLEY. *Process of making sulfonates.*

Pyridin and chloro-sulphonic acid are caused to react in a neutral solvent; a phenol is added; the solvent removed, and the resulting mixture is treated with potash and the pyridin driven off, and the potassium salt obtained is saturated with an acid.

647,237—April 10, 1900. F. SCHMIDT. *Diamidodiphenylamin sulfonic acid and process of making same.*

A new product, yielding dyestuffs, is produced by condensing molecular quantities of para-chlornitrobenzenesulphonic acid or its salts with para-phenylenediaminsulphonic acid or its salts and subsequent reduction.

648,261—April 24, 1900. B. HOMOLKA AND A. STOCK. *Nitrobenzylanilin sulfonic acid and process of making same.*

A new product, where the nitro group is in the ortho or para position, being a yellow powder, is produced by heating nitrobenzyl-chloride—where the nitro group is in ortho or para position—with an aqueous solution of a salt of anilin-sulphonic acid in the presence of alkaline substances.

648,568—May 1, 1900. J. KOETSCHET. *Process of making toluene sulfochlorid.*

Toluene is treated with three or more parts by weight of chloro-sulphonic acid free from sulphuric anhydride, the temperature being maintained between 5° and 35° C. or about 10° C.

650,218—May 22, 1900. E. BARELL. *Orthoguaiacol sulfo-acid and process of making same.*

A new product, crystallized in small laminæ which do not melt up to 270° C., is produced by treating pure guaiacol with concentrated sulphuric acid at from 70° to 80° C., isolating a solution of the barium salt thus formed, decomposing same with sulphuric acid, concentrating and crystallizing out by refrigeration.

651,045—June 5, 1900. J. LAGUTT. *Process of making saccharin.*

Orthosulphamidobenzoic acid is dissolved in a dehydrating agent, as sulphuric acid, and after standing at ordinary temperature it is poured upon ice and water, thereby causing the precipitation of saccharine.

NITROGEN COMPOUNDS.

NITROSUBSTITUTION COMPOUNDS.

252,473—January 17, 1882. J. A. KENDALL. *Manufacture of dinitro-benzole from gas obtained by distillation of coal.*

It is obtained from benzole or nitro-benzole existing in gas produced from carbonaceous substances, by passing the gas through a mixture of nitric and sulphuric acids, the latter being in excess.

412,680—October 8, 1889. C. SAVIGNY. *Process of treating the mother liquors of phenol nitrates.*

The mother liquors resulting from the manufacture of nitro-phenols are heated, and nitric acid distilled therefrom; then cooled, and picric or nitro-cresylic acid precipitated; then heated, and the sulphuric acid concentrated, and nitrates added to effect the nitrification of phenols, cresols and the like.

650,332—May 22, 1900. M. MANDT AND R. HOLDMANN. *Process of oxidizing orthonitrotoluene.*

Ortho-nitro-toluene is oxidized in the side chain by treatment with sulphuric acid and maganese peroxide at a temperature above 100° C.

SUBSTITUTED AMMONIAS.

296,825—March 25, 1884. Z. H. SKRAUP. *Manufacture of parachinanisol.*

A new product; an oily liquid. It is obtained from the methylic ether of phenol by heating mixtures of nitro and amido anisol with glycerine and sulphuric acid.

308,286—November 18, 1884. Z. H. SKRAUP. *Production of tetrahydro-parachinanisol.*

A new product; m. p. 43° C., b. p. 283° C. It is obtained from parachinanisol by the action of nascent hydrogen, and develops an intensely green color by the action of perchloride of iron, bichromate of potash, or an aqueous solution of chlorine upon the free base or its saline compounds; hence it is also styled "thalline."

343,803—June 15, 1886. C. FAHLBERG. *Medicated benzoic sulphinide compound.*

A medicated compound, consisting of benzoic sulphinide and an organic alkaloid, as quinine, produced by dissolving benzoic sulphinide and the alkaloid in alcohol or water and crystallizing out the salt.

400,086—March 26, 1899. O. HINSBERG. *Phenacetine.*

A new product of the general composition $C_{10}H_{13}O_2N$; m. p. 135° C. It is obtained by reducing nitrophenetole and fusing the phenetidin-chlorhydrate thus formed with dried sodium acetate and glacial acetic acid.

422,251—February 25, 1890. S. RADLAUER. *Process of preparing a hypnotic.*

Chloral-urethane and alcohol are caused to act upon each other in a vacuum at a temperature of 100° C, and the product, having the formula $C_7H_{12}Cl_3O_3N$, with m. p. 42° C., is crystallized in water.

422,334—February 25, 1890. T. CURTIUS. *Hydrazin.*

A new product, expressed by the formula N_2H_4, which, in the form of a gas, is set free from its hydrate by metallic sodium. The hydrate is formed by the action of sodium nitrite on the chlorhydrate of glycocoll ether, the diazo-acetic ether produced being converted into the triazo acetate and the salt of hydrazin derived therefrom and converted into the hydrate of this hydrazin.

425,039—April 8, 1890. J. F. VON MERING. *Chloralformamide.*

A new product, having anæsthetic properties and m. p. 115°-116° C., of the formula $C_2HCl_3O{:}CHO.NH_2$.

425,040—April 8, 1890. J. F. VON MERING. *Chloralformamide.*

The process of producing the same (No. 425,039) consists in treating chloral with formamide, in the proportion of their molecular weights.

428,286—May 20, 1890. C. PAAL. *Phenyldihydroquinazoline.*

A new medical compound, having the formula $C_{14}H_{12}N_2$, and m. p. 95° C. It is produced by acting with reducing agents upon the formyl derivative of the orthonitrobenzyl analine.

489,728—January 10, 1893. J. BERLINERBLAU. *Paraphenetol-carbamide and process of making same.*

A new compound, having a sweet taste, crystallizing in white needles and soluble in hot water and the ordinary solvents, is produced by treating paraphenetidine or para-anisidine with phosgene, each in a solvent, as benzole, filtering, adding ammonia to the filtrate, distilling off the solvent, and crystallizing.

502,504—August 1, 1893. H. THOMS. *Process of making para-phenetol carbamide.*

A compound having a strong sweet taste, and a m. p. of 170° C., is produced by boiling an aqueous solution of para-phenetidin-hydrochloride (three molecules) with common urea (two molecules), or the carbamide salt of ammonia or ammonium carbonate may be used.

503,748—August 22, 1893. L. LEDERER. *Amido-crotonylanilid and process of making it.*

A new compound, of the formula $C_{10}H_{10}(NH_2)NO$, moderately soluble in most solvents, crystallizing in colorless needles, and having a m. p. of 146°-147° C., is produced by treating acetylacetanilid with ammonia and allowing it to stand twenty-four to thirty hours.

526,258—September 18, 1894. S. RADLAUER. *Salicyl-anilid.*

A new compound, soluble in alcohol, but not in water, m. p. 100° C., is produced by heating acetanilid with salicylic acid in molecular proportions.

535,846—March 19, 1895. J. F. VON MERING. *Substitution product of phenetidin.*

New compounds, antipyretic bodies, difficult of solution in water, are produced by heating together phenetidin, a suitable acid such as propionic or butyric acid, and a condensation product, such as zinc chloride, in such proportions that one hydrogen atom of the amido group in the phenetidin is replaced by an acid remainder of greater molecular weight than acetyl.

536,524—March 26, 1895. W. HERZBERG. *Amidotriazin.*

See Group XI, Dyestuffs, Artificial, Organic.

540,732—June 11, 1895. M. FREUND. *Hydrastinin.*

A new product, $C_{11}H_{13}NO_3$, m. p. 116°-117° C., combining with one equivalent of an acid, is produced by subjecting hydrastine to the action of an oxidizing agent.

543,579—July 30, 1895. L. LEDERER. *Process of producing phenoxacetic anilids, etc.*

The anilids of the phenoxacetic acids, as phenoxacet-para-phenetidids, are produced by reacting on phenoxacetic acids with aromatic amido-compounds, as para-phenetidin, and crystallizing out with alcohol.

558,863—April 21, 1896. F. VALENTINER. *Process of making acetophenonphenetidin.*

Molecular weights of acetophenon and para-phenetidin are heated together.

563,009—June 30, 1896. A. BISCHLER. *Methoxy-acetphenetidin.*

A new product, crystallizing in white needles, m. p. 102° C., of general formula $C_{11}H_{15}NO_3$, and soluble in cold water. It is formed by heating the alkyloxy-fatty acids or the chlorides of the amids thereof, with primary and secondary aromatic amins, as by heating para-phenetidin with methoxy-acetic acid.

567,968—September 22, 1896. A. EICHENGRÜN. *Iodoform combination with hexamethylentetramine.*

New compounds, crystalline inodorous additive combinations of iodoform with hexamethylentetramine, or its haloidalkyl derivatives, which are not soluble in water and are decomposed by acids or alkalis, liberating iodoform, are produced by the reaction of the constituent in a solvent, as iodoform and hexamethylenamine in absolute alcohol.

569,416—October 13, 1896. O. HINSBERG. *Ester of alkoylamidophenols and method of making same.*

Carbonic esters of alkoylamidophenol, colorless compounds, m. p. 80° to 161° C., easily soluble in hot water or alcohol, are produced, together with their derivatives, by treating alkoylamidophenols, and their derivatives, the nitrogen atom of which is alkylated, in the form of their salts with esters of chlorcarbonic acid.

574,395—January 5, 1897. R. W. CORNELISON AND W. H. WARREN. *Process of obtaining aceto derivatives of aromatic amins.*

They are produced directly by the reaction of an acetic-acid salt and an aromatic-amin salt upon each other; the acetic-acid radical being replaced with another acid radical, such as a sulphuric-acid radical, and the acetic-acid radical thus liberated caused to react finally with an aromatic amin, as anilin.

574,396—January 5, 1897. R. W. CORNELISON AND W. H. WARREN. *Process of obtaining aceto derivatives of aromatic amins.*

They are produced by the reactions of an acid salt of acetic acid with the desired aromatic amin.

574,874—January 12, 1897. H. BAUM. *Paraphenetidin compound.*

New medicinal paraphenetidin compounds, as meta-alkyloxy, salicylidenparaphenetidin, are produced by condensing gentisinaldehyde with paraphenetidin, and alkylating the product of condensation.

576,379—February 2, 1897. I. ROOS. *Salicyl paraphenetidin.*

New products, as the orthoöxybenzyliden-alkyl derivative of amido phenol, insoluble in water, soluble in alcohol, etc., m. p. 94° C., of the formula Alk. $OC_6H_4N(CHC_6H_4OH)$ are produced by condensing salicylaldehyde with an alkyl derivative of amidophenol.

578,384—March 9, 1897. P. T. AUSTEN AND H. C. TUTTLE. *Process of making acetanilid, etc.*

Acetanilid or the acetoluids are formed by heating anilin or the toluidins with dilute acetic acid, or even with crude pyroligneous acid, under pressure.

586,551—July 20, 1897. F. W. FRERICHS. *Process of manufacturing acetanitid.*

Acetic acid and anilin oil are subjected to distillation with agitation under reduced pressure until most of the free anilin oil and acetic acid has been removed; the last traces are then removed by distillation under the action of live steam.

586,854—July 20, 1897. W. MAJERT. *Process of making ammoniacal casein.*

A new compound, in dry solid form, easily soluble in water, is produced by treating finely-powdered dry casein with ammonia gas.

595,897—December 21, 1897. H. R. VIDAL. *Process of making paramidophenol.*

Oxyazobenzol is reduced by sodium sulphide in the presence of a caustic alkali.

596,797—January 4, 1898. E. TAUBER. *Process of making amidins.*

New products, the amidins of amidophenol ethers, as ethenylparaparadiethoxydiphenylamidin, m. p. 121° C., are produced by heating the acetyl compounds of amido-phenol ethers with amidophenol ethers themselves and a dehydrating agent, such as a halogen compound of phosphorus, phosphorous sulphide, and hydrochloric acid.

602,109—April 12, 1898. I. ROOS. *Process of making salts of paramidophenol.*

New products, the primary salts of citric acid with alkyl ethers of paramidophenol, white or crystalline compounds, m. p. 186°-187° C., soluble in water and less so in alcohol, are produced by dissolving molecular quantities of citric acid and amidophenol alkyl ether in a solvent, as alcohol, and crystallizing.

602,690—April 19, 1898. C. F. M. SCHAERGES AND P. SCHWARZ. *Acetyl derivative of phenetidin.*

New products, the acetyl derivatives of alkaline phenetidin sulphonates, as sodium acetyl phenetidin sulphonate, a reddish-white microcrystalline, hygroscopic body, soluble in water, are prepared by treating phenetidin with concentrated sulphuric acid, converting the phenetidin-sulphonic acid into a salt, and acetylizing this salt by means of glacial acetic acid and acetic anhydrid.

605,977—June 21, 1898. B. R. SEIFERT. *Oxyphenyl-guanidin and process of making same.*

Certain new oxyphenyl-guanidins adapted to cause anesthesia, are produced by melting or dissolving together a carbodiimid with an amidophenol body.

615,828—December 13, 1898. H. C. FEHRLIN. *Process of purifying acetanilid.*

Crude acetanilid is distilled, preferably under diminished pressure, by a current of superheated vapors of acetic acid of a temperature not lower than the boiling point of acetanilid at the vacuum used.

615,829, December 13, 1898. H. C. FEHRLIN. *Process of making acetanilid.*

A current of superheated vapors of acetic acid at 185° C. is passed through anilin oil heated to 160° C., and the water simultaneously removed, until the conversion of the anilin-oil into acetanilid is satisfactorily completed.

618,809—January 31, 1899. H. R. VIDAL. *Process of making amidophenols.*

An amido-sulphonic acid of the aromatic series in a concentrated sulphuric acid solution is reacted upon by an oxidizing agent, as manganese peroxide.

629,099—July 18, 1899. F. VALENTINER. *Process of making acetophenonphenetidid.*

Acetophenone and paraphenetidin in molecular proportions are heated in a vacuum to the combination temperature, when the desired product is distilled off in vacuum.

640,563—January 2, 1900. B. HOMOLKA AND A. STOCK. *Process of making amidobenzyliden anilin compounds.*

Nitrobenzylanilins are subjected to the action of alkali sulphids while heated.

641,100—January 9, 1900. H. GUSSMANN. *Process of making para-oxy-para-amido-ortho-oxydiphenylamin.*

Para-oxy-para-amido-diphenylamin-ortho-sulphonic acid is heated with caustic alkalis at 150° to 200° C.

641,870—January 23, 1900. L. KNORR. *Naphthalanmorpholin.*

New products, as ethylnaphthalanmorpholin, a thick oil, distilling at 320° C., forming crystals, m. p. 237° to 238° C., are produced by the action of ethanolamins upon dihydronaphthalene oxide, and heating of the naphthol product with acids.

647,075—April 10, 1900. W. H. CLAUS, A. RÉE, AND L. MARCHLEWSKI. *Process of making compounds of paraphenetidin.*

A solution of paraphenetidin and glucose in a solvent is heated, the solvent thereafter separated, and the uncombined constituents dissolved out with solvents.

PURINS AND DERIVATIVES.

Purins.

559,347—April 28, 1896. E. FISCHER. *Chloro-theophyllin and process of preparing it.*

A new compound, $C_5H\,(CH_3)_2ClN_4O_2$; m. p. 300° C., soluble in hot alcohol. It is produced by heating 1 part dimethyl-uric acid with 2 parts phosphorus pentachloride and 4 parts phosphorus oxychloride to 150° C. for several hours.

571,353—November 17, 1896. E. FISCHER. *Bromotheophyllin and process of making same.*

A new compound, $C_5H\,(CH_3)_2BrN_4O_2$, m. p. 315° to 320° C., soluble with difficulty in alcohol and water, is produced by heating a mixture of theophyllin, 1 part, and bromine, 5 parts, under pressure; driving off the excess of bromine, and purifying the residue.

598,502—February 8, 1898. E. FISCHER. *Process of making purins.*

A new product, trichloropurin, $C_5HN_4Cl_3 + H_2O$, m. p. 184° to 188° C., is produced by heating dichloroxypurin, 1 part, with phosphorus oxychloride, 70 parts; and agitation; then evaporating *in vacuo.* To purify the crude product ether is added, the ether removed, and the residue boiled in water.

607,028—July 12, 1898. E. FISCHER. *Process of making purin derivatives.*

New crystalline compounds, amido purin derivatives which have the amido radical bound to the alloxan nucleus of the purin residue, are produced by the action of ammonia upon a chlorine derivative of purin having chlorine bound to the alloxan nucleus. They dissolve with difficulty in alcohol or water and decompose at high temperature before or while melting.

607,029—July 12, 1898. E. FISCHER. *Adenin and process of making same.*

A new compound, methyl-adenin, m. p. 347° C., is produced by agitating amido dichloropurin with hydriodic acid and phosphonium iodide for several hours at ordinary temperature, then heating to the boiling point and until a clear solution results; filtering and treating with ammonia.

617,985—January 17, 1899. E. FISCHER. *Alkyl-purin and process of making same.*

A new compound, 7-methyl-2-6-dichloropurin, m. p. 196° to 197° C., is prepared by heating theobromine with phosphorus oxychloride under pressure, then removing excess of phosphorus oxychloride, adding water, and treating with dilute soda lye. Methylized oxypurins are prepared by treating methyldichloropurin with an alkali, and paraxanthin by subsequent treatment of the foregoing with a mineral acid.

625,441—May 23, 1899. E. FISCHER. *Thio derivative of purin and making same.*

New compounds, a thiopurin having the group SH bound to one or more of the carbon atoms of the purin molecule, as 1-3-7-trimethyl-2-6-dioxy 8-thiopurin or thiocaffein, crystallizing in fine flexible needles, m. p. 308° C. They are produced by heating under pressure a halogen-purin derivative with the solution of an alkaline sulphydrate and then acidulating the solution.

631,705—August 22, 1899. E. FISCHER. *Process of making theobromin.*

3-7-dimethyl-6-amido-2-8-dioxypurin is treated with phosphorous-oxy-chloride, the resulting oxychloropurin is isolated and treated with a reducing agent, and the then resulting 3-7-dimethyl-6-amido-2-oxypurin, a new product, is isolated and acted upon with nitrous acid.

631,706—August 22, 1899. E. FISCHER. *Oxypurin and process of making same.*

Trichloro-purin is acted upon with an alcoholic alkali; the 2-8-dichloro-6-alkyl-oxypurin is then acted upon with hydrochloric acid and the resulting dichloro-oxypurin alkalized; the product, 1-7-dimethyl-6-oxy-2-8-dichloro purin, being a new compound, m. p. between 245° and 255° C. Subsequent treatment produces alkylized hypoxanthins, etc.

631,708—August 22, 1899. E. FISCHER. *Oxypurin and process of making same.*

A new compound, 8-chloro-2-6-diethoxypurin, m. p. 205° C., is produced by heating trichloropurin with excess of sodium-ethylate. This product is dissolved in hydriodic acid and treated with phosphonium-iodide to produce xanthin.

631,709—August 22, 1899. E. FISCHER. *Oxypurin and process of making same.*

A new compound, 6-oxy-2-8-dichlor-purin, is produced by treating 2-8-dichlor-6-ethoxy-purin with fuming hydrochloric acid and heat. This product is treated with hydriodic acid and phosphonium iodide to obtain hypoxanthin.

632,828—September 12, 1899. F. ACH. *Process of making uric-acid derivatives.*

An alkaline solution of a uric acid is treated with a haloid ether at a low temperature.

647,392—April 10, 1900. E. FISCHER. *Oxypurin and process of making same.*

2-8-dichloro-6-ethoxy-purin, a new compound, m. p. 200° C., is produced by dissolving trichloropurin in ethyl alcohol, treating with a sodium solution, and finally supersaturating with acetic acid. Said compound is treated with a reducing agent to produce hypoxanthins.

Xanthins.

569,489—October 13, 1896. E. FISCHER. *Process of making xanthin derivatives.*

Dialkyl uric acid is treated with a pentahalogen compound of phosphorus in the presence of a solvent, such as phosphorus oxychloride, and the resulting halogen derivative is treated with a reducing agent to convert it into a homologue of xanthin of the type of theophyllin.

569,490—October 13, 1896. E. FISCHER. *Process of making derivatives of xanthin.*

A halogen dialkyl derivative of xanthin (No. 569,489) is converted into its salt, which salt is then alkylized and the resulting halogen trialkyl derivative of xanthin reduced, whereby the homologue of xanthin of the type of caffein is produced.

588,327—August 17, 1897. E. FISCHER. *Process of obtaining xanthin derivatives.*

Tetramethyl-uric acid is heated with five times its weight of phosphorus oxychloride in a closed vessel to 160° to 165° C. for ten hours, and the crude product then subjected to the action of fuming hydrochloric acid, the solution evaporated to dryness, and t eated with soda lye. The chlorocaffein remaining is acted upon by reducing agents to obtain caffein.

617,986—January 17, 1899. E. FISCHER. *Process of making heteroxanthin.*

7-methyl-2-6-dichloropurin is heated with hydrochloric acid under pressure.

618,045—January 17, 1899. E. FISCHER. *Alkyl-hypoxanthin and process of making same.*

A new compound, methyl hypoxanthin, m. p. 353° C., readily soluble in water, assuming a brown color when heated to 340° C., is produced by heating 7-methyl-6-oxy-2-chloropurin with hydriodic acid and phosphonium iodide. The product is methylated to produce dimethyl-hypoxanthin.

631,707—August 22, 1899. E. FISCHER. *Xanthin derivatives and process of making same.*

A new product, chloroxanthin, or 8-chloro-2-6-dioxy-purin, is produced by treating an 8-chloro-2-6-dialkyl-oxpurin with hydrochloric acid. The product is subsequently alkylized and treated with methyl iodide.

631,757—August 22, 1899. F. ACH. *Xanthin derivative and process of making same.*

Certain alkyl-uric acids, as 3-methyl-uric acid, are treated with phosphorus-oxy-chloride, producing a new compound, 3-methyl-chloro-xanthin, having no melting point, but decomposing at 345° C. This compound is submitted to the action of reducing and methylating agents.

631,758—August 22, 1899. F. ACH. *Alkyl-xanthin derivative and process of making same.*

A 7-alkyl-uric acid, as 7-methyl-uric acid, is heated with phosphorus-oxy-chloride alone and the product purified and crystallized. The new compound, chloro-heteroxanthin, has no melting point, but decomposes at 340° C. It is alkylized and reduced.

631,759—August 22, 1899. F. ACH. *Alkyl-xanthin and process of making same.*

A new product, chloro-theo-bromin, m. p. 292° to 293° C., is produced by heating 3-7-dimethyl-uric acid with phosphorus-oxy-chloride alone, crystallizing, dissolving in alkali, and precipitating with acid. This product is alkylized and reduced.

631,760—August 22, 1889. F. ACH. *Alkylized xanthin and process of making same.*

A new compound, 3-methyl-xanthin, having no melting point, but decomposing at 400° C., is produced by heating 3-methyl-chloro-xanthin with hydriodic acid and phosphonium-iodide. This product is alkylized and reduced.

PYRAZOLES.

307,399—October 28, 1884. L. KNORR. *Preparation of dimethyl-phenyl-oxypyrazol.*

A new product, m. p. 113° C. Acetylacetic ether is mixed with a molecular quantity of phenyl-hydrazine, water is eliminated, and the condensed product, phenyl-hydrazine-acetylacetic ether, is heated to 100° to 150° C. and crystallized, forming methyl-phenyl-oxypyrazol. This is heated with methyl chloride, bromide, or iodide and converted into dimethyl-phenyl-oxypyrazol.

CHINOLINES OR QUINOLINES.

237,917—February 15, 1881. Z. H. SKRAUP. *Production of oxychinoline.*

A new product, for the manufacture of blue dyestuffs and other purposes, produced by the action of glycerine and sulphuric acid upon a mixture of ortho-nitro-phenol and ortho-amido-phenol.

237,918—February 15, 1881. Z. H. SKRAUP. *Production of oxychinoline.*

A new product, for the manufacture of blue dyestuffs and other purposes, produced by the action of glycerine and sulphuric acid upon a mixture of para-nitro-phenol and para-amido-phenol.

241,738—May 17, 1881. Z. H. SKRAUP. *Manufacture of artificial chinoline.*

A new product. It is produced by the action of glycerine and sulphuric acid upon a mixture of nitro-benzole and aniline.

252,846—January 24, 1882. W. PICKHARDT AND H. ENDEMANN. *Preparation of chinoline.*

Citrate of chinoline, a new product, is made by treating purified artificial chinoline (No. 241,738) with citric acid.

252,847—January 24, 1882. W. PICKHARDT AND H. ENDEMANN. *Preparation of chinoline.*

Sulphate of chinoline, a new product, is made by treating purified artificial chinoline dissolved in alcohol with sulphuric acid.

254,097—February 21, 1882. W. PICKHARDT AND H. ENDEMANN. *Medical compound.*

Hydrochlorate of chinoline, white and free from lepidine, is made by dissolving purified artificial chinoline in aqueous hydrochloric acid and evaporating.

254,098—February 21, 1882. W. PICKHARDT AND H. ENDEMANN *Manufacture of chinoline.*

The artificial chinoline of Skraup is refined and purified by treatment with tartaric acid, the acid tartrate of chinoline being separated from the solution, and the chinoline liberated by the action of caustic alkalis.

256,444—April 11, 1882. W. PICKHARDT AND H. ENDEMANN. *Salicylate of chinoline.*

A new product. It is made from purified artificial chinoline by treatment in alcohol with salicylic acid.

256,445—April 11, 1882. W. PICKHARDT AND H. ENDEMANN. *Benzoate of chinoline.*

A new product. It is made from purified artificial chinoline by the distillation of a mixture of pure benzoic acid and chinoline.

257,828—May 9, 1882. W. PICKHARDT AND H. ENDEMANN. *Tartrate of oxychinoline.*

It is prepared by the action of tartaric acid upon the oxychinoline of Skraup, (No. 237,918).

257,829—May 9, 1882. W. PICKHARDT AND H. ENDEMANN. *Hydrochlorate of oxychinoline.*

It is prepared by the action of hydrochloric acid upon the oxychinoline of Skraup.

260,317—June 27, 1882. W. PICKHARDT AND H. ENDEMANN. *Acid tannate of chinoline.*

A new product. It is prepared by evaporating a mixture of tannic acid, 5 pounds, and artificial chinoline, 1 pound, in a minimum quantity of water.

260,318—June 27, 1882. W. PICKHARDT AND H. ENDEMANN. *Neutral tannate of chinoline.*

A new product. It is prepared by evaporating a mixture of tannic acid, 5 pounds, and artificial chinoline, 2 pounds, in a minimum quantity of water.

260,319—June 27, 1882. W. PICKHARDT AND H. ENDEMANN. *Basic tannate of chinoline.*

A new product. It is prepared by evaporating a mixture of tannic acid, 5 pounds, and artificial chinoline, 3 pounds, in a minimum quantity of water.

270,045—January 2, 1883. O. FISCHER. *Method of preparing oxyquinoline.*

Oxyquinoline, a new antiseptic, is obtained by treating quinoline-sulphonic acid with caustic soda or potash, under the action of heat.

273,498—March 6, 1883. O. FISCHER. *Process of preparing oxyhydro-ethyl chinoline.*

Oxyhydro-ethyl chinoline, a new product, is made by first converting chinoline into oxychinoline, then treating the same with tin and hydrochloric acid and converting the oxyhydro-chinoline produced into oxyhydro-ethyl chinoline by treatment of the isomeric oxyhydro-chinoline with ethyl iodide by heat in a water bath, and extracting the base with water and precipitating with caustic soda.

276,796—May 1, 1883. O. FISCHER. *Preparation of oxyhydro-methyl chinoline.*

Oxyhydro-methyl chinoline, a new product, is produced by substituting methyl iodide for ethyl iodide in the process of No. 273,498.

282,488—August 7, 1883. A. BÖHRINGER. *Method of producing monalcylised hydro-bases.*

They are produced by first converting the tertiary bases (as chinoline) into salts of the ammonium bases (as chloride of methyl-chinoline) by alcylisation, and then hydrogenizing said salts to produce acid salts which liberate the monacylated hydro-bases (as mono-ethyl-hydro-chinoline).

355,842—January 11, 1887. R. SCHMITT. *Manufacture of oxychinoline carbonates.*

They are produced by treating the oxychinoline alkalies and earthy alkalies with carbonic acid under pressure and at an elevated temperature.

466,707—January 5, 1892. J. ZIEGLER. *Process of preparing phenol sulphonates of oxychinoline.*

The ortho and para phenol sulphonates of ortho-oxychinoline are formed by the production of ortho-oxychinoline by digesting orthoamido-phenolparasulphonic acid with orthonitrophenolparasulphonic acid and with glycerine and sulphuric acid; precipitating the oxychinoline from the product of the reaction by means of soda and purifying it; and then heating it with ortho or para phenol sulphonic acid in molecular proportions. The phenol sulphonate of oxychinoline is a yellow sirup, solidifying in crystals at a low degree of cold or in a vacuum chamber.

466,708—January 5, 1892. J. ZIEGLER. *Process of preparing oxychinoline sulphate.*

The substitution of sulphuric acid for the ortho or para phenol sulphonic acid of process No. 466,707 (in the proportion of two molecules of oxychinoline to one of sulphuric acid) results in the production of the sulphate of ortho-oxychinoline, a new product of the formula $C_{18}H_{14}N_2O_2.\ H_2SO_4$; m. p. 172°–173° C.

478,495—July 5, 1892. J. ZIEGLER. *Antiseptic quinoline.*

A soluble antiseptic, consisting of quinoline combined with a saponaceous solution. It is formed by saponifying oils or fats in the presence of quinoline; boiling until the solution is complete; and thereafter adding water to the solution.

486,363—November 15, 1892. J. ZIEGLER. *Chinolinchinophenol-sulphate and method of obtaining same.*

A new compound, a sulphur-yellow powder, soluble in water, m. p. 114° C., is produced from ortho-oxychinoline and chinoline by heating a mixture of one of the said substances and a sulphate of the other.

512,590—January 9, 1894. G. N. VIS. *Orthooxyethyl-alpha-benzoylamido-quinolin.*

A new compound, crystallizing in small needles, m. p. 206° C., and scarcely soluble in water, is produced by treating æthoxy amido quinoline or a hydrochloric acid salt thereof with benzoyl-chloride.

563,116—June 30, 1896. J. ZIEGLER. *Process of making quinolin compounds.*

An antiseptic disinfectant, soluble in water, is produced by boiling for ten hours two molecules O-oxyquinoline in alcohol with one molecule pyrosulphate of potassium, separating and drying the product.

CHINALDINES.

309,935—December 30, 1884. O. DOEBNER AND W. VON MILLER. *Manufacture of bases called chinaldines.*

New products applicable for the manufacture of coloring matters or for antiseptics and medicinal uses. They are obtained by combining an acid and a metallic salt, acting as a reducing agent, with aldehyde or its equivalents, and a primary aromatic base; purifying the base obtained by the reaction. Chinaldine is a fluid, b. p. 240° C.

316,248—April 21, 1885. O. DOEBNER AND W. VON MILLER. *Formation of methoxy and ethoxy chinaldine.*

New products, derivatives of chinaldine and applicable for the manufacture of coloring matters, or for antiseptic and antipyretic purposes. They are obtained from the sulpho-acid of the chinaldines by melting the same with alkali, and subsequent alkylation of the oxychinaldines formed; or by the action of aldehyde or the salts of amidophenols, amidophenol methyl, and amidophenol ethyl ethers. Methoxy-chinaldine, m. p. 125° C.; ethoxy-chinaldine, m. p. 72° C.

316,249—April 21, 1885. O. DOEBNER AND W. VON MILLER. *Formation of the hydrobase of chinaldine.*

Chinaldine bases or the oxymethoxy and althoxy chinaldines are boiled with tin and concentrated sulphuric acid, the product freed from tin, and the hydrobase separated by treatment with soda lye and distillation. They are new products applicable for the manufacture of grey coloring matter or as antiseptic or medicinal agents. Hydrochinaldine is an aromatic fluid, b. p. 246° C.; methoxy-hydrochinaldine, b. p. 270° C.

ISATINS.

310,604—January 13, 1885. P. J. MEYER. *Manufacture of isatins and substituted isatins.*

Isatins and substituted isatins, available for the manufacture of artificial indigo, are obtained from dihalogenized acids, their salts, amides, ethers, and aldehydes, or from aromatic amines or substituted amines, by directly fusing or boiling their solutions, and treating the product with a strong acid.

618,096—January 24, 1899. B. HEYMANN. *Diacetyl-indoxyl and process of making same.*

A new product, a white powder, nearly insoluble in water, m. p. 82° C., on heating with caustic lyes transformed into indoxyl, the latter yielding indigo by oxidation. It is produced by heating an alkaline salt of phenylglycinorthocarbonic acid with acetic anhydrid.

ALKALOIDS.

379,298—March 13, 1888. L. B. WELD. *Preparing hydrochlorate of quinia.*

Sulphate of quinine is dissolved in boiling alcohol with sodium chloride; sulphate of soda and excess of sodium chloride is precipitated by concentration; and the alcohol evaporated to deposit the hydrochlorate of quinine as crystals.

450,887—April 21, 1891. C. T. LIEBERMANN AND F. GIESEL. *Process of obtaining ecgonine.*

Ecgonine is produced from the amorphous alkaloids contained in coca leaves or in crude cocaine, by decomposing the amorphous alkaloids by a suitable medium, as by boiling in hydrochloric acid, into organic acids and ecgonine, separating the organic acids by filtration, evaporating the solution, and crystallizing the ecgonine with alcohol. The ecgonine is converted, by treatment with benzoyl or benzoic anhydride, into benzoyl-ecgonine, and the latter may be converted into cocaine.

501,066—July 11, 1893. E. GRIMAUX. *Process of making salts of quinine.*

Chlorhydro-sulphate or bromhydro-sulphate of quinine, double salts possessing great solubility, are prepared by adding to and incorporating with basic quinine sulphate, hydrochloric and hydrobromic acids, respectively, and removing the excess of the reagent.

584,388—June 15, 1897. J. F. F. VON MERING. *Benzyl-morphin.*

A new product, $C_{17}H_{18}NO_2OC_6H_5CH_2$, crystallizing in large brilliant prisms, but slightly soluble in water, easily soluble in alcohol, etc., is produced by heating morphin in presence of an alkali—as sodium-alkylate—a benzyl halogen and a suitable solvent, as alcohol, separating the precipitate, neutralizing it by an acid, as hydrochloric acid, and then purifying.

585,610—June 29, 1897. R. WILLSTÄTTER. *Process of making pseudotropin.*

Tropin is treated with alkalies at an elevated temperature, as by boiling with a concentrated amyl-alcoholic solution of sodium amylate.

597,804—January 25, 1898. J. U. LLOYD. *Method of and apparatus for extracting nicotine.*

A column of tobacco in a closed chamber is burned from the bottom, the products of combustion being drawn up through the mass of unburned tobacco, and the nicotine vapors absorbed in an acid solution.

605,491—June 14, 1898. E. LANGHELD. *Quinine derivative and process of making same.*

A new derivative, $C_{19}H_{20}N_2O_5$, a yellowish amorphous powder, very soluble in water, alcohol, etc., and having an acid reaction, is produced by treating a quinine solution with ozonized gas until precipitation will not be caused by an alkali.

620,406—February 28, 1899. F. D. BANNING. *Process of extracting nicotine.*

Steam and ammonia are passed through the tobacco fiber and then into reclaiming acid.

623,798—April 25, 1899. R. MACKILL. *Extracting nicotin.*

A tobacco extract is first agitated with a caustic-soda solution, then gasoline is added and again agitated, when the gasoline with the nicotine in solution is decanted and distilled.

625,075—May 16, 1899. A. WELLER. *Carbonic esters of cinchona alkaloids and process of making same.*

New, tasteless products, insoluble in water and benzene, soluble in alcohol and acids. They are produced by reacting with phosgene upon sufficient cinchona alkaloid to displace both chlorine molecules of the phosgene with the cinchona alkaloid; then adding an acid to form the corresponding salt.

629,264—July 18, 1899. F. J. VON MERING. *Process of making ethyl morphin.*

Ethyl bromide is caused to act upon an alkaline solution of morphine.

637,839—November 28, 1899. A. WELLER. *Tasteless quinin compound.*

Tasteless products, derivatives of the quinine or cinchonidin carbonic acid, are prepared by causing the cinchona alkaloids or their salts to act either upon substituted isocyanates or upon substituted carbonic chlorides.

640,977—January 9, 1900. H. THRON. *Process of making quinin carbonic ether.*

The salts of the alkaloids of the cinchona bark are acted upon with an ether of chlorocarbonic acid.

PYRAZINES AND PIPERAZINES.

471,520—March 22, 1892. W. MAJERT. *Process of making piperazin.*

It is obtained from its hydrocarbon compounds, as dinaphthylpiperazin, by isolating the piperazin by means of an alkaline solution, distilling off the piperazin into a suitable acid to form salts, and crystallizing out the salts.

482,108—September 6, 1892. P. VOLKMANN. *Process of making piperazin.*

The dinitroso compounds of diphenylpiperazin, ditolylpiperazin, dixylylpiperazin, dinaphthylpiperazin, or the sulpho acids or other substitution products thereof, are treated with sulphurous acid, sulphur dioxide, or alkaline bisulphites.

500,665—July 4, 1893. W. MARCKWALD. *Process of obtaining piperazin.*

A salt of ethylene or an aromatic amide is caused to act upon an aromatic sulpho-compound of an amide in the presence of an alkali at a temperature above the normal, producing an aromatic disulphonic piperazide. This product is mixed with water or an inorganic acid solution and heated, whereby the piperazin is split off as an acid sulphate, and the acid salt is neutralized at a temperature above the normal, whereby free piperazin is obtained.

509,087—November 21, 1893. W. MAJERT. *Process of making piperazine.*

Diphenyl or ditolyl piperazine, or a salt thereof, is subjected to the action of the fumes of anhydrous sulphuric acid, the sulpho product is treated with fuming sulphuric acid, and an alkali or alkaline earth is then mixed therewith and the mixture heated.

511,303—December 19, 1893. W. MAJERT AND A. SCHMIDT. *Piperazin.*

Anhydrous piperazine, a new compound, of the formula $C_4H_{10}N_2$, a yellowish crystalline substance, m. p. 104° to 112° C., and a strong solvent of uric acid, is produced by distilling a mixture of piperazine-hydrate and a solid alkali hydrate, several times repeated, then heating the distillate in a closed vessel with an alkali-hydroxide or barium oxide, and finally distilling the mixture over sodium.

514,632—February 13, 1894. C. STOEHR. *Dimethylpiperazin.*

A new compound, $C_6H_{14}N_2$, forming white crystals, m. p. 118° C., and b. p. 162° C., and easily soluble in water and alcohol, is produced by distilling glycerine with ammonium chloride and ammonium carbonate, or agents giving off ammonia, and then isolating the thus formed dimethylpyrazine and reducing it, as by metallic sodium alcohol.

597,454—January 18, 1898. W. B. & A. BISHOP. *Process of making piperazin salts.*

Stable salts are produced by thoroughly mixing piperazine or piperazine hydrate and an organic hydroxy acid, as citric or tartaric acid, by melting or in solution, crystallizing slowly, and afterwards heating to expel moisture.

597,745—January 25, 1898. P. SCHIDROWITZ AND O. ROSENHEIM. *Piperidin derivative.*

New products, as a derivative of piperidin with guaiacol of the formula $(C_7H_8O_2)_2C_5H_{11}N$, are produced by acting upon piperidin or its homologues with an ether of a monoxyphenol.

615,488—December 6, 1898. L. KNORR. *Morpholin and process of making same.*

A new product, the morpholin C_4H_9NO, a liquid with b. p. 128° C., soluble in water, alcohol, etc., having an odor similar to piperidin, is produced by heating certain derivatives of dioxyethylamin with acid condensation agents, then making the solution alkaline and distilling with steam.

PROTEIDS.

544,912—August 20, 1895. N. R. FINSEN. *Process of making hæmatin albumen.*

A new food product is produced by mixing defibrinated blood with nitric acid, coagulating with heat, washing and drying the albumen, heating the product *in vacuo*, and powdering.

566,280—August 18, 1896. O. SCHMIEDEBERG. *Process of obtaining iron derivatives of albumen.*

An iron derivative of albumen is extracted from the liver or other animal organ by slowly heating with water to the boiling point, separating the coagulum and treating it with dilute tartaric acid.

567,706—September 15, 1896. D. FINKLER. *Method of obtaining albumen.*

The fatty constituents of albuminous substances being first saponified and washed out, the other undesirable constituents are decomposed by boiling with a suitable reagent, as peroxide of hydrogen; the products of decomposition are washed out with a neutral salt solution, the albumen separated from the solution, and traces of the latter removed with alcohol.

632,408—September 5, 1899. W. A. HALL. *Process of producing casein.*

The curd is precipitated from milk by means of muriatic acid, and the casein thus formed is subjected to a temperature sufficient to volatilize the acid—about 120° F.—and preferably in the presence of a current of air.

GROUP XIX.—CHEMICALS NOT OTHERWISE ENUMERATED.

INORGANIC.

SULPHUR.

166,279—August 3, 1875. S. H. JOHNSON. *Improvement in methods of and apparatus for separating free sulphur.*

The sulphur-bearing substance in a dry state is mixed with carbon bisulphide and heated in a closed vessel with agitation; the agitation stopped, and the liquid contents forced through the settled granular residuum forming a filter by the vapor pressure generated. A fresh charge of carbon bisulphide is then admitted into the extractor, mixed with the residuum by agitation, settled, the liquid contents discharged into a separate receiver, and the resultant product applied to a fresh charge of sulphur-bearing material, thus securing a strong solution for evaporation.

182,362—September 19, 1876. E. J. FRASER. *Improvement in processes and apparatus for refining and packing sulphur.*

Fused sulphur is run into wet sacks.

349,981—September 28, 1886. C. F. CLAUS. *Obtaining sulphur from hydrogen sulphide.*

Hydrogen sulphide mixed with a chemical equivalent of atmospheric oxygen is passed through anhydrous oxide of iron preheated to not less than 93° C., whereby the desired heat of the oxide is maintained, and free sulphur is continuously formed.

354,393—December 14, 1886. C. F. CLAUS. *Process of obtaining sulphur from sulphureted hydrogen.*

As an improvement on the process of No. 349,981, the iron oxide is mixed with lime, magnesia, alumina, or like substances to prevent the formation of clinkers.

359,164—March 8, 1887. H. L. LIGHTNER. *Apparatus for atomizing sulphur.*

Sulphur is reduced to an impalpable powder by atomizing liquid sulphur with a jet of hot air or steam.

361,761—April 26, 1887. E. HÄNISCH AND M. SCHROEDER. *Process of obtaining sulphur from furnace-gases.*

The furnace gases are passed through water or a water-tower; which water is then heated, and the sulphurous acid gas thereby absorbed and given off is passed through or over a glowing bed of fuel, and then through a glowing mass of fire-brick in the absence of a reducing agent.

443,629—December 30, 1890. E. F. WHITE. *Manufacture of flowers of sulphur.*

Liquid sulphur, melted by a steam coil without boiling, is fed through a siphon into a retort and boiled under less than an atmospheric pressure, the vapor being passed to a condenser and the condensed sulphur forced by an air blast to a receiver. The air blast creates the partial vacuum in the retort and the flow of liquid sulphur thereinto.

493,193—March 7, 1893. C. W. STICKNEY. *Process of roasting sulphur-bearing ores.*

One portion of the ore is roasted with steam generating hydrogen sulphide, and another portion is roasted with air generating sulphurous acid gas, and the gases are mingled in contact with a solution of a sulphate of iron, copper, or zinc, resulting in the deposition of the sulphur.

502,431—August 1, 1893. H. H. EAMES. *Process of desulphurizing metallic ores.*

See Group X, Electro-chemistry.

616,391—December 20, 1898. V. DE BARANOFF AND E. HILDT. *Process of obtaining sulfur from sulfates.*

Sulphur, sulphurous acid, and sulphides are simultaneously produced direct from sulphates by reducing a metallic sulphate by means of carbon under heat, causing the carbonic acid generated to act in presence of water upon a metallic sulphide to generate hydrogen sulphide; and then treating a metallic sulphate with the hydrogen sulphide under heat and decomposing the sulphate into sulphur, sulphurous acid, and sulphides.

PHOSPHOROUS.

171,813—January 4, 1876. A. G. HUNTER. *Improvement in retorts for distilling phosphorous.*

The phosphoric-acid mixture is heated in a retort and the volatilized products are caused to pass through carbon in another portion of the retort heated to a white heat before passing to the condenser.

417,943—December 24, 1889. J. B. READMAN. *Process of obtaining phosphorous.*

See Group X, Electro-chemistry.

452,821—May 26, 1891. H. H. WING. *Manufacture of phosphorus.*

A mixture of a phosphate and a silicate is calcined by a reducing flame at a high temperature, whereby phosphoric anhydride is expelled and reduced, the fumes passing to a depositing chamber maintained at about 260° C., in which red phosphorus is deposited, the remaining fumes being conducted through water chambers in which yellow phosphorus is condensed.

527,163—October 9, 1894. A. SHEARER AND R. R. CLAPP. *Process of making phosphorus.*

A pulverized mixture of a metallic chloride—as sodium or potassium chloride—and carbon and calcined phosphate of alumina is heated in a retort in the presence of dried hydrochloric acid gas.

602,747—April 19, 1898. C. K. HARDING. *Process of smelting phosphorus.*

See Group X, Electro-chemistry.

CARBON.

90,824—June 1, 1869. J. DICKINSON. *Improvement in the preparation of mineral carbon for use in the arts.*

Black diamonds are shaped with drill points and cutting edges and faces for dressing or cutting stones, etc., and firmly setting in metal tools, by rubbing or abrading one diamond or carbon against another.

263,758—September 5, 1882. C. F. BRUSH. *Process of baking carbon rods.*

For baking, the rods are stacked in pyramidal form in a receptacle and the interspaces and spaces at ends and sides of the pyramidal pile filled with sand.

379,960—March 27, 1888. C. H. LAND. *Manufacture of refractory carbon.*

Carbonaceous matter is subjected in an open muffle, located in a furnace, to the products of combustion under pressure, whereby a counter-resistance is offered to expel oxygen from the muffle, prevent ignition of said matter, and drive off determined elements therefrom.

568,323—September 29, 1896. E. G. ACHESON. *Manufacture of graphite.*

See Group X, Electro-chemistry.

598,549—February 8, 1898. H. H. WING. *Process of manufacturing graphite.*

See Group X, Electro-chemistry.

617,979—January 17, 1899. E. G. ACHESON. *Method of manufacturing graphite articles.*

See Group X, Electro-chemistry.

645,285—March 13, 1900. E. G. ACHESON. *Method of manufacturing graphite.*

See Group X, Electro-chemistry.

HALOID COMPOUNDS.

696,573—October 8, 1867. J. E. MILLS. *Improvement in the manufacture of chloride of zinc.*

Zinc chloride is produced direct from its oxide, carbonate, or silicate ores by digesting same with muriatic acid. In the case of silicate ores the chloride is freed from the gelatinous silica by evaporating the water and excess of acid and redissolving the zinc chloride. Iron and manganese, when present, are separated by drying the digested mass, oxidizing, and redissolving the zinc chloride.

175,583—April 4, 1876. J. WYETH. *Improvement in compressed chloride of ammonium.*

Chloride of ammonium is compressed into a rod or cylinder, for convenience in use.

196,464—October 23, 1877. C. LENNIG. *Improvement in manufacture of sal ammoniac and sulphate of soda or potash.*

A mixture of sulphate of ammonia and muriate of soda, or potash, is continuously fed into and through a furnace chamber heated to a dull cherry-red heat, and sulphate of soda, or potash, continuously withdrawn; sal ammoniac being continuously condensed in a condensing chamber in the form of flaky particles.

212,596—February 25, 1879. W. GENTLES. *Improvement in manufacture of muriate of ammonia.*

Suitable ammoniacal liquor is distilled and the volatilized carbonate of ammonia passed into a solution of calcium chloride, the resultant solution heated, the remaining clear liquor treated with hydrochloric acid, and the arsenic of the calcium-chloride and hydrochloric acid precipitated as tartar-sulphide of arsenic plus a little sulphur. The clear and settled liquor is rendered alkaline with the ammoniacal liquor evolved, the iron settled, and the liquor condensed to crystallization.

220,449—October 7, 1879. W. H. WAHL AND E. Y. ELTONHEAD. *Improvement in the manufacture of chloride of zinc.*

Crude chloride of zinc is made from precipitated dross by granulating the same and treating with hydrochloric acid.

231,860—August 31, 1880. E. SOLVAY. *Manufacture of chloride of lime.*

The hydrate of lime is formed into small fragments of uniform size, as little balls.

234,595—November 16, 1880. J. F. N. MACAY. *Manufacture of ferric oxide and cupric chloride.*

See Group XIX, Inorganic, Oxides.

236,051—December 28, 1880. E. J. MALLET, Jr. *Manufacture of chloride of zinc.*

A refrigerant is applied to the surface stratum only of a solution containing zinc sulphate and a salt, such as sodium chloride, and the crystallization excited extends throughout the warmer body of the solution as well as the cold top stratum.

319,118—June 2, 1885. A. PATCHEN. *Solution of dichloride of copper, etc., for treating ores.*

A solution of sulphate of copper with sodium chloride and metallic copper is subjected to pressure and heat in a closed retort.

330,155—November 10, 1885. T. SCHMIDTBORN. *Process of making ammonium chloride.*

Ammonium sulphate and potassium chloride are brought together in an aqueous solution and heated to about 150° C. for an hour, cooled until needles begin to form, when the supernatant liquor is removed and evaporated to obtain the ammonium chloride, while the precipitate—potassium sulphate—is freed from adhering liquor.

338,061—March 16, 1886. R. GRÄTZEL. *Process of making fluorine salts.*

Fluoride of aluminium and double fluorides of aluminium and potassium, or of aluminium and sodium, are produced from fluorides of alkali metals by treatment with chloride of aluminium.

351,184—October 19, 1886. C. F. MABERY. *Producing anhydrous aluminium chloride.*

Hydrochloric-acid gas is passed over aluminium or aluminium alloy heated to from 200° to 300° C., and the vaporized aluminium chloride formed is condensed; or hydrochloric-acid gas is passed through an electric furnace where aluminium is being reduced from its ore or compounds.

356,133—January 18, 1887. G. JÁRMAY. *Separating ammonium chloride from solutions by refrigeration.*

Sodium chloride is added to the warm liquor obtained in the ammonia-soda process, containing ammonium chloride, sodium chloride, and carbonates of ammonium and of sodium, and it is then refrigerated and ammonium chloride deposited. The liquor may be then warmed, more sodium chloride added and again refrigerated with deposition of ammonium chloride; the mother liquor being then used in the ammonia-soda process instead of brine.

359,601—March 22, 1887. W. FRISHMUTH. *Process of making aluminium chloride.*

An intimate mixture of aluminium oxide, sodium chloride, and carbon, in equal parts by weight, with a carbonizable agglutinating material, as molasses, is molded into lumps and subjected to a temperature high enough to carbonize without disintegrating the lumps, and then distilled in a retort in the presence of chlorine gas.

385,345—July 3, 1888. C. A. FAURE. *Process of obtaining aluminium chloride.*

An aluminium ore is heated in direct contact with the flame to a proper combining temperature, then a mixture of hydrochloric-acid gas and hydrocarbon vapor is passed over the heated ore and the resulting vapor condensed.

386,137—July 17, 1888. G. JÁRMAY. *Separating ammonium chloride.*

To the residual liquor from the ammonia-soda process there is added at one operation the requisite quantity of sodium chloride to replace the ammonium chloride, such amount being greater than what would saturate the original ammonium chloride liquor. The salt is kept in suspension by constant agitation, and at the same time cooled, whereby ammonium chloride separates out. The mother liquor is applicable in the ammonia-soda process in the place of brine.

386,704—July 24, 1888. L. GRABAU. *Manufacture of aluminium fluoride.*

The alkali fluoride in cryolite is converted into aluminium fluoride by treating cryolite with sulphate of ammonia, evaporating the solution, heating the product to redness and finally washing the same.

393,578—November 27, 1888. L. PAGET. *Production of zinc chloride, etc.*

See Group X, Electro-chemistry.

409,668—August 27, 1889. H. Y. CASTNER. *Purifying aluminium chlorides.*

Anhydrous double chlorides of aluminium are melted with a suitable quantity of a metal, as aluminium or sodium, adapted to reduce the contained iron to a metallic state, which is then separated.

412,800—October 15, 1889. W. SHAPLEIGH. *Process of making lead chloride.*

Finely divided lead is introduced into an aqueous solution of nitric acid, a blast of air being forced through the liquor while it is undergoing chemical action. Lead chloride is then precipitated by the addition of hydrochloric acid together with a blast of air to oxidize the lower oxides of nitrogen given off, and lead nitrate is then added to remove the excess of hydrochloric acid.

414,835—November 12, 1889. F. W. A. FRERICHS. *Process of making bromides of the alkalis.*

Bromides of potassium, of sodium, and of ammonium are produced from their respective sulphates by mixing the sulphate with calcium hydroxide, calcium sulphite, or calcium bisulphite, water, and bromine. By evaporation and crystallization the pure bromides are obtained.

422,500—March 4, 1890. H. Y. CASTNER. *Process of purifying aluminium chloride.*

The anhydrous double chloride compounds of aluminium containing iron are melted and passed through a series of electrolytic tanks, the iron chlorides being decomposed and metallic iron deposited. The electric current gradually decreases in quantity proportioned to the gradually decreasing quantity of iron.

434,044—July 1, 1890. O. O. B. FROELICH. *Process of making antimony fluorides.*

A powdered mixture of antimony ore, alkaline nitrates, and fluor spar is treated with oil of vitriol, and the soluble matter then extracted with water and steam. After neutralizing with alkalis the liquor is evaporated to crystallization.

447,063—February 24, 1891. E. RICHTER. *Process of making artificial cryolite.*

Gaseous silicic fluoride, obtained in treating phosphates containing fluorine with sulphuric acid, is converted with water into a solution of hydrofluosilicic acid, and treated with alumina hydrate and a caustic alkali or an alkali carbonate to form artificial cryolite and silicic acid, which are separated by filtration.

479,925—August 2, 1892. C. WACHENDORFF. *Double salts of fluoride of antimony and sulphate of ammonia.*

A new double salt of fluoride of antimony and sulphate of ammonia having the formula $(SbFl_3)_2.1\frac{1}{4}(NH_4)_2SO_4$, is produced by pouring into not too much water the product obtained by heating crude antimony with sulphuric acid, producing a basic sulphate of antimony which is put into the theoretical quantity of ammonium fluoride in aqueous solution, heated, and then crystallized out. Also by charging fluoride of antimony with less than the theoretical quantity of ammonium sulphate for crystallization.

508,796—November 14, 1893. W. ACKERMANN. *Process of making aluminum fluoride.*

To produce an aluminium fluoride solution free from silicious bodies, calcined silicate of aluminium is treated with an acid, as hydrofluoric acid, whereby the silicon is converted into insoluble silicic acid which is removed by filtration.

509,478—November 28, 1893. T. MAYER. *Antimony compound and process of making same.*

A new series of double salts, crystalline compounds corresponding to the type $2SbF_3.M_2SO_4$, are produced by causing an alkali sulphate to act upon antimonious fluoride in quantities of two molecules of the latter to one of the former. Oxide of antimony is dissolved in a mixture of one-third hydrochloric acid and two-thirds hydrofluoric acid and then the alkali metal sulphate is added.

513,901—January 16, 1894. H. S. BLACKMORE. *Process of making alkali salts.*

Soluble non-silicious salts of the alkalis are produced from insoluble combinations or mixtures containing alkali silicates by exposing the alkali silicates (as orthoclase) to the action of the oxide and salt of an earth metal (as calcium oxide and calcium chloride) at a high temperature, say 1,100° C., in the presence of super-heated steam under super-atmospheric pressure, then cooling and separating the soluble alkali salt or salts.

513,971—February 6 1894. W. ACKERMANN. *Process of making aluminum fluoride.*

Iron is removed from solutions of aluminium fluoride by converting it into a ferrous combination by means of hydrosulphuric acid, and then crystallizing out the aluminium fluoride.

514,125—February 6, 1894. F. M. LYTE AND G. LUNGE. *Process of making caustic alkali and lead chloride.*

See Group II, Caustic Soda.

523,715—July 31, 1894. A. SOMMER. *Process of making liquid chlorides.*

Chlorides are made from solid substances by exposing the same to chlorine and allowing the liquid chloride to drain away as rapidly as formed without previous volatilization. In flowing through a cooler in a thin stream to a receiver it is subjected to the action of chlorine gas.

529,070—November 13, 1894. P. GREDT. *Process of recovering iodides, chlorides, or other salts from blast-furnace gases.*

The gases are subjected to water showered as fine rain, the same liquid being pumped up and used until a strong lye is produced, which is evaporated down, the volatile constitutents being driven off, and the solid residue containing iodide and chloride of potassium is dissolved in water and separated by fractional crystallization.

532,150—January 8, 1895. O. O. B. FROELICH. *Double salts of antimony.*

A new antimony mordant, a soluble crystalline compound of antimony fluoride with a double oxalate of antimony and alkali, is produced by combining solutions in water of antimony fluoride and of oxalate of antimony and alkali, in the proportion of one molecule of oxalic acid to three molecules of hydrofluoric acid.

535,601—March 12, 1895. C. SCHILL AND C. SEILACHER. *Double salt of antimony and process of obtaining same.*

A new compound, a double salt of antimonious fluoride, having the formula $3SbF_3.NH_4F$, forming rhombic prisms and soluble in the proportion of 10 parts of salt to 8 parts of water, is produced by dissolving 100 parts of antimonious oxide in excess of hydrofluoric acid, then adding 4 parts of ammonia, filtering and crystallizing.

558,725—April 21, 1896. F. A. GOOCH. *Process of producing hydrous chloride of aluminium.*

Aluminous material heated and under pressure is treated with dilute hydrochloric acid of half strength; the filtered solution is treated with gaseous hydrochloric acid to the point of saturation, and the resulting precipitated hydrous aluminium chloride is separated out and washed with concentrated hydrochloric acid.

558,726—April 21, 1896. F. A. GOOCH. *Process of producing hydrous chloride of aluminium.*

A suitable aluminous earth is heated with sulphuric acid until the acid fumes cease to be evolved, and the process is then proceeded with according to No. 558,725.

582,938—May 18, 1897. W. MILLS. *Process of making fluorides.*

Metallic fluorides are prepared from aqueous solutions of metallic chlorides by heating together a mixture of ammonium sulphate and calcic fluoride (fluorspar) at about 350° C., and then adding the ammonium fluoride thus obtained to the chloride solution.

599,111—February 15, 1898. F. RAYNAUD. *Process of making aluminium-sodium chloride.*

A current of hydrogen sulphide and a current of atmospheric air are passed alternately through a mass of blocks of a porous mixture of bauxite, carbon, and sea salt heated to redness until the whole of the aluminium is converted into chloride.

640,908—January 9, 1900. H. K. HESS. *Process of and apparatus for making chloride of zinc.*

Hydrogen gas is produced by heating chloride of zinc above its melting point by contact with a body of incandescent carbon in a state of combustion, introducing steam into the carbon, and reducing the zinc chloride, thereby forming hydrochloric acid and zinc, vaporizing the hydrochloric acid which passes over to a condenser, the metallic zinc passing through the carbon into a receptacle, and finally uniting the zinc and the acid, and re-forming chloride of zinc and producing hydrogen.

641,406—January 16, 1900. J. G. A. RHODIN. *Process of obtaining soluble potassium salts from feldspar.*

A pulverized mixture of feldspar (orthoclase), lime, both equal parts, and sodium chloride, one-fifth part, is heated to a bright yellow heat and maintained for a considerable time without melting or fusion. After cooling the potassium readily combines with acids to form salts. For fertilizer purposes an excess of lime is advantageous.

648,809—May 1, 1900. O. J. STEINHART, J. L. F. VOGEL, AND H. E. FRY. *Process of making anhydrous zinc chloride.*

A zinc chloride solution is boiled in a partial vacuum. A current of previously dried air is passed through and over the molten chloride.

OXIDES.

151,219—May 26, 1874. R. GUENTHER. *Improvement in the manufacture of dry soluble silica.*

Concentrated silicate of soda or potash is added to hyposulphite of soda which has been heated until the water of crystallization is nearly evaporated, causing the liquid glass to coagulate. The latter is taken out, freed of adhering hyposulphite by pressure while yet warm, and subsequently pulverized. The hyposulphite is evaporated and again used.

206,635—July 30, 1878. R. & C. STEINAU. *Improvement in preparation of peroxide of iron.*

Water is caused to alternately rise and fall through a layer or mass of iron scraps, as lathe turnings, and the peroxide formed is collected.

234,595—November 16, 1880. J. F. N. MACAY. *Manufacture of ferric oxide and cupric chloride.*

Modified hydrated ferric oxide, after being calcined, known as "colcothor" or "jewelers' rouge," and cupric chloride are produced at one operation by the mutual reaction, in the presence of air, of cupric oxychloride and solution of ferrous chloride; or ferrous or ferric sulphate and cupric oxychloride are digested in a solution of sodium chloride with access of air.

239,346—March 29, 1881. C. SCHEIBLER. *Process of obtaining magnesia.*

Dolomite or other lime and magnesia compound is burned and then treated with a saccharine solution, 10 to 15 per cent of sugar, to dissolve out the lime, the magnesia being separated from the other insoluble constituents after precipitation by decantation, filtration, or otherwise. The caustic product may be comminuted by slaking to a pulverulent hydrate and then treated with the saccharine solution.

252,982—January 31, 1882. J. WEBSTER. *Manufacture of soluble alumina.*

Aluminous material, as commercial alum, is mixed with carbonaceous material, as gas pitch, and roasted; then treated with dilute hydrochloric acid and allowed to give off sulphureted hydrogen; then steam and air is passed through the compound while heated to carry off sulphur and ferric sulphide; and finally the residuum is boiled and the liquor drawn off after cooling, leaving the soluble alumina as a precipitate. The vapors of sulphur and ferric sulphide are condensed for use in the manufacture of colors, etc.

266,115—October 17, 1882. A. K. EATON. *Preparing peroxide of lead.*

Red lead is treated with acetic acid, by which the peroxide component of the red lead is removed, producing acetate of lead and leaving the peroxide of lead as a residuum.

266,970—November 7, 1882. J. B. M. P. CLOSSON. *Manufacture of magnesia.*

Crude or artificially recarbonated dolomite is digested with a solution of chloride of calcium and the resulting solution of magnesium chloride is heated with calcined dolomite or ordinary burned lime.

267,551—November 14, 1882. C. MARCHAND. *Manufacture of binoxides of barium and calcium.*

Barium or calcium binoxide is produced by subjecting baryta or lime, heated to a red heat, to the action of ozonized oxygen or ozonized air.

285,579—September 25, 1883. J. D. DARLING. *Process of producing alumina.*

Alumina is obtained from alum salts or compounds, or from aluminum sulphate by forming a gelatinous hydrated precipitate, subjecting the precipitate to a suitable heat to convert it into a calcined oxide and expel therefrom the sulphate of ammonia contained therein, and finally leaching therefrom the remaining sulphates or other impurities.

294,051—February 26, 1884. J. K. KESSLER. *Process of making copper salts by the aid of electricity.*

See Group X, Electro-chemistry.

305,828—September 30, 1884. C. MARCHAND AND V. M. PICABIA. *Manufacture of anhydrous caustic baryta.*

Barium nitrate is subjected in a closed vessel to the direct action of gases heated to 1,000° to 1,300° C., driving off the oxide of nitrogen and liquefying the baryta. The retort has a removable top and is mounted on trunnions and, after solidification, the cake is dumped.

318,603—May 26, 1885. G. DEUMELANDT. *Process of separating basic compounds from slags.*

The free bases contained in basic slag are separated by treating the pulverized slag at the boiling temperature with a solution of a suitable ammonium salt, filtering off the solution, and treating the filtered solution with a mixture of air and carbonic acid in the presence of ammonia, to precipitate the dissolved oxides.

338,628—March 23, 1886. L. Q. & A. BRIN. *Manufacture of anhydrous oxide of barium.*

In the manufacture of anhydrous oxide of barium or baryta by calcining barium nitrate, moisture and carbonic acid are excluded from the baryta while cooling by exhausting the air of the cooling chamber, or filling same with a gas, such as nitrogen, destitute of moisture, and carbon dioxide.

359,423—March 15, 1887. A. BRIN. *Process of making barium bioxide.*

Barium nitrate is first heated to form caustic baryta, then the caustic baryta is reheated in a closed vessel with an exhaust to remove the nitrous and other gases given off, and when the vapors cease to be given off atmospheric air is admitted to form barium bioxide.

370,511—September 27, 1887. C. L. & W. J. WIGG AND M. STEELE. *Obtaining ferric oxide from the waste liquors of copper-works.*

The residual liquors obtained in the precipitation of copper by the wet process and the residual chloride-of-calcium liquor obtained in the manufacture of chlorine by the Weldon process are mixed and agitated, the precipitate and supernatant liquor separated, and the liquor treated with an equivalent of lime to precipitate the iron, which is oxidized and furnaced. The white precipitate first formed is treated with dilute hydrochloric acid, washed, pressed, and gently heated to purify and prepare the sulphate of lime for use as a by-product.

382,197—May 1, 1888. F. J. SEYMOUR. *Method of obtaining alumina from clay.*

Clay or aluminous earth mixed with a deoxidizing agent, as pulverized carbon, and a flux, such as chloride of sodium, and with copper or other metal of greater specific and atomic weight than aluminium, is heated to a temperature of 1,400° to 2,000° C., and the mixed vapors are condensed and collected in a conduit, silica first depositing, and beyond, alumina mixed with the metallic oxide.

382,273—May 1, 1888. F. J. SEYMOUR. *Method of obtaining alumina from clay.*

A modification of the process of No. 382,197, the clay being mixed with zinc, carbon, and a flux.

382,505—May 8, 1888. K. J. BAYER. *Process of obtaining alumina.*

Pure alumina compounds are obtained from bauxite and other materials containing alumina, by subjecting the aluminate lye under constant stirring and at ordinary temperature to the action of hydrate of alumina, so as to decompose said solution and precipitate hydrate of alumina, the remaining mother liquor being concentrated, mixed with bauxite or other material containing alumina, and the mixture calcined.

440,539—November 11, 1890. F. CANDY. *Process of preparing iron ore for filters.*

Argillaceous carbonate of iron is subjected in a closed retort to a carbonizing but not a fusing heat, gradually cooled and then pulverized for use for filtering purposes.

455,229—June 30, 1891. L. MOND. *Process of making compounds of nickel and carbon monoxide.*

Oxidized nickel ore is exposed to the reducing action of carbon monoxide, hydrogen, or a hydrocarbon, at from 300° to 350° C.; then the reduced oxide is cooled to below 150° C. and treated with carbon monoxide (free from uncombined oxygen and halogens) till the nickel is extracted and the vapors are condensed.

455,229—June 30, 1891. L. MOND. *Compound of nickel and carbon monoxide.*

Nickel-carbon oxide, a compound of nickel and carbon monoxide of the formula NiC_4O_4, is a colorless liquid, B. P. about 43° C., but very volatile in the presence of other gases. Solidifies at −25° C.

455,611—July 7, 1891. P. A. EMANUEL. *Process of reducing kaolins and clays to their component oxides.*

The clay, stirred in with water until in a state of suspension, is treated with sulphuric acid and heat, and the sulphate of alumina separated from the silica, iron being removed with binoxide of lead or manganese, and the solution evaporated to recover the sulphate of aluminium. Sulphate of aluminium is reduced to alumina by mixing with sulphur and heating, the fumes being conducted to sulphuric-acid chambers.

461,416—October 20, 1891. J. A. BRADBURN AND J. D. PENNOCK. *Process of obtaining alumina from bauxite.*

The iron and organic matter in ferrous bauxite is oxidized by mixing the ground mineral with a solution of hypochlorite and then passing carbonic-acid gas into the solution. The oxidized bauxite is then treated with a caustic-soda solution, filtered, and the hydrate of aluminium precipitated and calcined.

494,757—April 4, 1893. H. Y. CASTNER. *Manufacture of oxides of the alkaline metals.*

The alkaline metals, heated to about 300° C., are oxidized by the action of air with a decreasing proportionate mixture of nitrogen, the material being moved through a tubular retort in one direction with a current of air moving in the opposite direction.

514,039—February 6, 1894. H. F. D. SCHWAHN. *Process of purifying aluminous minerals.*

Minerals containing alumina are roasted, ground, and mixed with hydrochloric and nitric acids—or crude material as sodium chloride and sodium or potassium nitrate to produce the same—then sulphuric acid is added, the decomposed mass is heated, the waste nitro-hydrochloric acid and produced ferric chloride are evaporated and expelled, and the remaining soluble and insoluble impurities respectively removed by washing and floating.

515,895—March 6, 1894. K. J. BAYER. *Process of making alumina.*

Alumina is dissolved direct from bauxite by mixing pulverized bauxite in a concentrated aluminate lye formed by subjecting an aluminate lye under constant stirring and at ordinary temperature to the action of hydrate of alumina so as to decompose said solution and precipitate hydrate of alumina, then filtering off the precipitate and concentrating the remaining aluminate lye. The mixture is subjected to constant agitation at a pressure of three to four atmospheres at a temperature of 160° to 170° C.

519,704—May 15, 1894. A. G. FELL. *Obtaining lead salts from native ores.*

Ground lead ores are treated in an acid solution containing free sulphuric acid and formed of sulphuric acid, another inorganic acid, as muriatic or nitric acid, sulphate of soda, and water. The undissolved residue is separated from the solution of soluble salts, any contained silver is removed, and the residue is subjected under a moderate heat to a compound, as sal-soda, which contains an alkaline base. The insoluble lead salts are separated from this solution, nitric acid or nitrate is mixed with the residue, and it is roasted if an oxide is to be produced.

544,819—August 13, 1895. A. W. NIBELIUS. *Process of extracting aluminium oxid.*

The raw material—clay, clay-slate, anthracite-slate, minerals, and rocks, alone or mixed with pyrites—is mixed with the sulphate or bisulphate of an alkali and subjected while heated to a petroleum air flame, the acid being condensed and utilized for lixiviating the alumina, which is finally precipitated.

585,522—June 29, 1897. H. JAEGER. *Process of making tin oxid.*

Metallic tin is raised to a high temperature, 1,200° C., in the absence of air; then, when at said high temperature, abundance of air is admitted to the molten metal, and the tin oxide formed is removed.

624,041—May 2, 1899. C. B. JACOBS. *Process of manufacturing soluble barium compounds.*

See Group X, Electro-chemistry.

626,330—June 6, 1899. C. LUCKOW. *Process of producing peroxide of lead.*

See Group X, Electro-chemistry.

626,547—June 6, 1899. C. LUCKOW. *Process of producing oxid of copper.*

See Group X, Electro-chemistry.

641,550—January 16, 1900. M. E. ROTHBERG. *Process of making magnesia and plaster-of-paris.*

Limestone containing carbonate of magnesia is dissolved in hydrochloric acid producing a solution of the chlorides of calcium and magnesia; calcium oxide is added to precipitate magnesia and form additional calcium chloride; the liquor is drawn off, leaving the magnesia to be washed and dried, and sulphuric acid is added to precipitate calcium sulphate, which is separated, dried, and calcined. The hydrochloric-acid solution is reused.

644,050—February 27, 1900. H. BECKMANN. *Manufacture of lead peroxide and its application to electrical storage batteries.*

See Group X, Electro-chemistry.

647,320—April 10, 1900. S. B. NEWBERRY. *Process of making strontia.*

A mixture of strontium sulphate, or celestite, and an oxide of an alkaline earth, as lime, is calcined at a high temperature. The calcined product is leached.

650,023—May 22, 1900. H. OPPERMANN. *Process of making magnesium superoxid.*

Magnesium hydrate, 50 parts, moistened to such an extent only that it retains its powdery form, is mixed with dry, pulverized, sodium superoxide, 10 to 12 parts. An excess of dry, pulverized magnesium hydrate is added during the reaction to reduce the temperature of the mixture below that at which oxygen is liberated.

650,518—May 29, 1900. C. SAVIGNY. *Process of making dioxid of barium.*

A mixture of hydrated crystallized baryta and finely divided carbon in equal parts is heated to 150° C. to drive off the greater part of the water; the mixture is then heated in a metallic basin for two to three hours at 100° to 150° C., when the magma is transferred to and heated in a crucible lined with carbonaceous material, as cardboard, to 1,000° to 1,200° C. for from five to eight hours, producing porous anhydrous oxide of barium, which is then deoxidized.

650,763—May 29, 1900. E. RAYNAUD. *Method of obtaining alumina from its ores.*

A mixture of crushed aluminous ore, ores which resist attack wholly or partially by sulphurous acid, and a quantity of a sulphureted compound of an alkaline metal, as sodium sulphide, smaller than would be necessary for forming aluminates, is heated to a dark red heat for about two hours; then lixiviated, and the residue treated to the action of a current of sulphurous-acid gas in combination with water, the alumina dissolving as a sulphite. The solution is then filtered, heated, and the precipitate calcined, yielding alumina and sulphurous gas.

SULPHIDES.

126,275—April 30, 1872. A. K. EATON. *Improvement in the manufacture of sulphide of sodium.*

Crude sulphate of soda is melted in a heated tube and percolated through highly heated carbon, whereby it is decomposed and sodium sulphide produced.

233,680—October 26, 1880. E. C. E. & L. L. LABOIS. *Manufacture of carbon bisulphide and sulphuric acid from pyrites, and apparatus therefor.*

See Group I, Acids, Sulphuric Acid.

278,816—June 5, 1883. C. E. PARSONS. *Method of producing golden sulphuret of antimony.*

Native sulphide of antimony (antimony glance) and sulphur are separately dissolved in saturated solutions of caustic alkali, which solutions are then mixed and the mixture treated with acid.

332,736—December 22, 1885. H. J. F. NIEWERTH. *Metallic alloy or compound in producing the same.*

Heavy metals are alloyed with the sulphurets of metals by first dissolving the sulphuret of the metal in molten zinc, and then mixing the product with the heavy metals desired to form the alloy in their molten condition, and finally expelling off the zinc. In the formation of alloys of heavy metals with the sulphuret of metals, small quantities of the sulphuret of an alkaline metal are added to the heavy metals in their molten condition, so that the decomposition of the sulphuret takes place gradually, and the sulphur and nascent alkali are enabled to combine with the heavy metals.

343,674—June 15, 1886. E. W. PARNELL AND J. SIMPSON. *Process of treating ammonium sulphide to obtain hydrogen sulphide.*

A mixture of ammonium sulphide and ammonium sesquicarbonate in solution is subjected to the action of heat—or of a partial vacuum—hydrogen sulphide being evolved.

425,061—April 8, 1890. A. KEILLER. *Process of making zinc sulphide.*

In the precipitation of zinc sulphide from neutral hydrated solutions of zinc salts by means of hydrothionic acid, a precipitation of all of the zinc is secured by the addition of an alkaline sulphate which is soluble in water and indifferent to the hydrothionic acid, as potassium sulphate.

463,143—November 17, 1891. P. A. EMANUEL. *Process of, and apparatus for, preparing aluminium sulphide.*

Dry aluminium sulphate mixed with sulphur is heated in a retort, and carbon bisulphide is injected into the residual product. An angular entrance for the carbon bisulphide jet gives a rotary movement to the charge.

513,660—January 30, 1894. C. T. J. VAUTIN. *Process of making aluminum sulfid.*

Metallic aluminium, slightly in excess, and lead sulphide (galena) are melted together at a bright red heat, producing metallic lead and aluminium sulphide.

586,567—July 20, 1897. B. VON SCHENK. *Process of making polysulfids.*

A mixture of sulphur and hydrated lime in the proportions, respectively, of 60 and 40 per cent, is boiled in water and a lye formed of 10° Baumé, descanted, and reduced to about 5° Baumé, when an alkali carbonate is added, and the solution descanted and evaporated to dryness, cooled, and ground, thus producing alkaline polysulphides by a reaction between soluble polysulphides of calcium and alkaline carbonates, or sulphates.

605,378—June 7, 1898. H. S. BLACKMORE. *Process of making aluminium sulfid.*

A heated mixture of aluminium oxide and carbon bisulphide is blown into a retort containing a chemically inert molten bath capable of dissolving aluminium sulphide, as cryolite, with a mixture of potassium and sodium chlorides.

605,458—June 7, 1898. H. S. BLACKMORE. *Process of making sulfids.*

Carbon-bisulphide vapor is passed through a molten aluminate of an alkali or other metal—as sodium aluminate or a mixture of sodium and potassium aluminate—producing aluminium sulphide with sulphides of the alkali or other metals. Aluminium oxide is added to molten sodium hydroxide to saturation, and the vapor passed therethrough.

605,812—June 14, 1898. H. S. BLACKMORE. *Process of making aluminium sulfid.*

Carbon bisulphide vapor is introduced into a fused bath—a mixture of cryolite and potassium fluoride—containing dissolved aluminium oxide, transforming the latter into aluminium sulphide.

606,576—June 28, 1898. D. A. PÉNIAKOFF. *Aluminium sulfid and process of making same.*

A new substance, porous aluminium sulphide, is produced by treating heated dehydrated sulphate of aluminium, alone or mixed with other metallic sulphates, by means of bisulphide of carbon or oxysulphide of carbon at a temperature below the fusing point of aluminium sulphide.

648,772—May 1, 1900. A. MOFFATT. *Process of making hydrosulfids.*

To produce in solution a hydrosulphide of an alkaline-earth metal, such as barium, calcium, o rontium, two equivalents of the sulphide of an alkaline-earth metal are m.xed with one equivalent of a magnesium salt. A dry mechanical mixture of the ingredients is suitable for shipment and storage.

BASIC HYDROXIDES.

Ammonia.

67,447—August 6, 1867. A. PARAF. *Improvement in the manufacture of ammonia.*

Ammoniacal liquor is distilled and the vapors purified by passing through charcoal.

127,470—June 4, 1872. R. J. EVERETT. *Improvement in the preparation of ammonia, sulphur, and other products from gas-lime.*

Spent gas-purifying materials are heated in a retort, the liquefied sulphur collected, and the sulphur vapors and ammonia condensed. The condensed product is washed to obtain therefrom sulphur and a solution of the ammonia salts, which latter, on boiling, filtering, and evaporating, gives sulphate of ammonia.

132,264—October 15, 1872. H. H. & C. J. EAMES. *Improvement in treating ammoniacal liquors of gas-works, etc.*

Ammoniacal liquor is subjected to the direct action of steam or superheated steam, while flowing in a stream, to eliminate the contained volatile substances by vaporization.

137,059—March 25, 1873. T. CHRISTY, JR., AND A. BORROWNICKI. *Improvement in processes for treating sewage and ammoniacal waters for the production of fertilizers, etc.*

Ammoniacal and other liquids of gas works, sewage, etc., are treated with a solution of a hydrated silicate to agglomerate suspended or dissolved matter. Ammonia is recovered and the product may be treated to produce cyanogen and other matters.

150,007—April 21, 1874. C. M. TESSIÉ DU MOTAY. *Improvement in transforming atmospheric gases into oxygen and ammonia, etc.*

Ammonia is produced by the reaction of carbureted hydrogen upon nitride of titanium—the latter being formed by the reduction of oxides of titanium or the spent nitride of titanium from a former operation—with coke in a blast furnace. Cyano-nitride of titanium is produced by prolonging the operation in the retort. The cyano-nitride is removed and treated with a soda or potash solution, setting free ammonia and forming the cyanides of sodium or potassium and titanic acid. The cyanides are obtained by evaporation. Pure hydrogen gas combined with light carbon vapors at a low temperature—e. g., zero—may be used in place of carbureted hydrogen for producing cyanogen compounds.

156,181—October 20, 1874. J. E. SIEBEL. *Improvement in recovering phosphoric acid and purifying ammonia.*

A solution of phospate of lime obtained in the treatment of bones with phosphoric acid is saturated with ammonia, phosphate of lime precipitated, and the solution evaporated, the ammonia collected, and the phosphoric acid recovered. By using crude ammonia the same can be purified.

158,265—December 29, 1874. L. S. FALES. *Improvement in processes and apparatus for the manufacture of aqua ammonia.*

The spent liquor of gas works is heated in a closed vessel, and so long as sulphureted hydrogen escapes the gas is conducted into a vessel charged with sulphuric acid, and after sulphureted hydrogen is no longer apparent it is conducted through a cold worm into a closed receiver, from thence into the lower compartment of a filter charged with alternate beds of charcoal and caustic alkalis, from the top of the filter into an oil chamber, and from thence into an ascending series of closed vessels containing water, having communication from one to another consecutively, and also with a common branched pipe, which conducts into one or more settlers.

161,137—March 23, 1875. F. MAXWELL-LYTE. *Improvement in processes of manufacturing ammonia.*

A triad or pentad element, as antimony or bismuth, combined with a readily-oxidizable element, as potassium or sodium, is used as a body for the synthetic manufacture of ammonia from aqueous vapor and nitrogen. A temperature between 100° and 400° C. should be maintained. The alloy is regenerated by means of a reducing agent at a red heat.

193,920—August 7, 1877. S. CABOT, JR. *Improvement in processes for obtaining ammonia salts.*

Salts of ammonia and bicarbonate of soda are produced as independent products by spraying a saline soda solution through volatilized mono-carbonate of ammonia charged with carbonic-acid gas.

230,303—July 20, 1880. J. L. MARSH. *Manufacture of aqua-ammonia.*

A mixture of sulphate of ammonia, lime and water is heated and volatilized in a steam jacketed vessel, with agitation around a horizontal axis, to expose a maximum area of surface to the heat.

232,991—October 5, 1880. H. P. LORENZEN. *Method and apparatus for obtaining ammonia.*

In the recovery of ammonia from nitrogenous substances by distillation, ammonia is developed from the gases by contact with incandescent oxide of calcium. It is then subjected to a cooling agent and to the action of sulphuric acid.

253,045—January 31, 1882. H. J. E. HENNEBUTTE. *Process of treating ammoniacal salts.*

In the treatment of ammoniacal salts the liquor is acidulated to prevent the formation of froth and foam before adding lime to decompose the fixed ammoniacal salts.

258,498—May 23, 1882. O. A. STEVENS AND E. L. DU BARRY. *Combined furnace and stack for destroying noxious or poisonous gases.*

Noxious gases evolved in the treatment of gas liquor are first passed in ascending currents over moist retarding surfaces and through a spray of water, and are then burned at an intense heat.

259,145—June 6, 1882. H. J. E. HENNEBUTTE AND C. J. F. R. DE J. MENARD. *Process of treating ammoniacal liquors.*

Salts of ammonia are produced from ammoniacal liquors by subjecting the liquor to the action of the mixed chlorides of calcium and iron and evaporating or concentrating the resulting liquor. A small quantity of the double chloride of ammonium and lead is added when evaporating in sheet metal vessels to preserve the same.

263,856—September 5, 1882. H. Y. & E. B. CASTNER. *Manufacture of ammonia and bone-black.*

Boneblack and ammonia are produced by passing the bone continuously through a closed, highly heated chamber, drawing off the volatile portions and heating the same mixed with air, then passing the gases over hot slaked lime through a cooler and finally in contact with acid.

264,801—September 19, 1882. R. W. WALLACE AND C. F. CLAUS. *Utilization of by-products in the manufacture of coal-gas.*

Ammonia is separated from ammoniacal liquor by treating the liquor with sodium chloride and carbonic acid, then separating the ammonium chloride from the solution and decomposing it by lime.

265,792—October 10, 1882. T. B. FOGARTY. *Process of, and apparatus for, manufacturing gas.*

In the manufacture of water gas cyanogen and cyanides are produced and the gas freed from nitrogen by burning in a combustion chamber the carbonic oxide and hydrogen produced in a generator furnace, and then passing the incandescent products of such combustion through a mass of carbon and alkali. Ammonia is then produced by decomposing the cyanides in another chamber with steam. The charge is then returned to the cyanidizing chamber.

265,793—October 10, 1882. T. B. FOGARTY. *Process of manufacturing gas.*

The claim is for the specific production of cyanogen by process No. 265,792.

267,550—November 14, 1882. J. G. MACFARLAN. *Process of and apparatus for the manufacture of ammonia and animal charcoal.*

Superheated steam, decomposed by being passed through carbonaceous matter, is passed into the bone retorts, accelerating the carbonization and increasing the ammonia product.

269,309—December 19, 1882. L. MOND. *Manufacture of cyanogen compounds and ammonia.*

In the manufacture of cyanogen compounds or of ammonia therefrom, the materials—carbon, carbonate or oxide of barium, and a basic absorbing material, as magnesia—are mixed and molded into blocks and calcined out of contact with air before exposing them in a heated state to the action of nitrogen.

277,041—May 8, 1883. F. LORENZ. *Process of and apparatus for obtaining ammonia.*

Relates to a series of consecutive steps for treating the hot gases of bone and other furnaces; moistening, cooling, passing through towers, heating, contact with acid, reusing fluid products for collecting ammonia, etc.

278,823—June 5, 1883. J. P. RICKMAN AND J. B. THOMPSON. *Manufacture of ammonia and its salts.*

Ammoniacal salts are produced from urine or like animal excreta by mixing therewith stale urine, or a portion of similar material in a state of fermentation, and distilling the ammoniacal gases into a vessel containing acid. The impure solution thus formed is then drawn off into a still, and the ammoniacal substances volatilized through an intercepting still to remove impurities, into a vessel containing sulphuric acid, for the formation of sulphate of ammonia.

282,411—July 31, 1883. B. TERNE. *Process of treating tank-waters of slaughter-houses.*

The liquor is concentrated to a semi-solid condition and then passed into and upon the floor of a heated retort, whereby it is rapidly distilled to dryness; the ammonia being collected and the residual partly nitrogenized animal matter utilized as a fertilizing compound.

288,323—November 13, 1883. T. B. FOGARTY. *Process of and apparatus for making ammonia.*

The process involves the formation of incandescent generator gas and the decomposition of the undecomposed steam in the crude gas by the carbonic oxide contained in the gas, the conversion of the nitrogen into ammonia by contact with a falling column of pulverized carbon and alkali, and the decomposition of the cyanogen produced by steam; the temperature being controlled by an adjustment of the amount of falling cyanidized carbon and the volume of steam.

288,324—November 13, 1883. T. B. FOGARTY. *Process of and apparatus for manufacturing ammonia.*

The process consists in treating a falling shower of pulverized alkalized carbon with a current of highly-heated nitrogenous or furnace gases to form cyanogen and cyanogen salts, then transferring these compounds to separate chambers, in which they are decomposed by steam with the formation of ammonia.

291,264—January 1, 1884. J. & J. ADDIE. *Process of obtaining ammonia from furnace-gases.*

Sulphurous acid, or the gas of sulphuric acid, is mixed with the gases from blast and other furnaces to fix the ammonia, and the ammonia salts are then recovered by condensing or dissolving.

304,260—August 26, 1884. E. CAREY, H. GASKELL, JR., AND F. HURTER. *Process of obtaining ammonia from ammonium sulphate.*

Sulphate of ammonia is intimately mixed with sulphate of soda and at an elevated temperature—about 300° C.—ammonia and bisulphate of soda are produced, in which latter form the sulphuric acid may be utilized for many purposes. A current of steam is required to make the reaction complete.

337,246—March 2, 1886. C. F. CLAUS. *Process of purifying coal-gas and obtaining ammonia and other products therefrom.*

Coal gas is purified by passing it with gaseous ammonia, supplied by the process, through a mixing chamber and a series of gas scrubbers, showering the liquor successively through a series of coke towers against an ascending flow of carbonic acid, separating the sulphide of hydrogen from the carbonated ammonia liquor, and then heating the latter from 75° to 90° C.—using the carbonic acid in the coke towers—and distilling the heated liquor and condensing the carbonate of ammonia.

337,387—March 9, 1886. A. FELDMANN. *Process of manufacturing ammonia.*

In the manufacture of spirits of sal ammoniac, a liquor free from lime and lime combinations is obtained by mechanical filtration—by a filter press or a centrifugal machine—in contradistinction to precipitation and decanting.

342,237—May 18, 1886. J. VAN RUYMBEKE. *Process of obtaining ammonia.*

Ammonia compounds are produced from liquids containing organic substances in solution by showering them through forced air currents over porous substances charged with putrid ferments, and subjecting the putrefied liquor mixed with an alkali to heat in closed boilers, and collecting the gases in refrigerating and sulphuric-acid condensers.

342,722—May 25, 1886. W. C. WREN. *Process of and apparatus for distilling ammonia.*

The process consists in vaporizing aqua ammonia, cooling the vapor and discharging it into a receiver, the vapor being under constant pressure during the entire operation.

343,675—June 15, 1886. E. W. PARNELL AND J. SIMPSON. *Recovery of ammonia in ammonia-soda manufacture.*

Ammonia and sulphureted hydrogen are produced by heating alkali waste—from the Le Blanc process—with a solution of chloride of ammonium producing sulphide of ammonium, which latter is decomposed by acid sulphate of ammonia evolving sulphureted hydrogen. The neutral sulphate of ammonia is heated till it parts with a portion of its ammonia, leaving acid sulphate of ammonia available for another charge.

351,412—October 26, 1886. J. VAN RUYMBEKE. *Process of obtaining ammonia and illuminating gas from tank waters.*

Concentrated tank waters are distilled at a heat not exceeding 260° C., and the volatile products collected, whereby highly-illuminating and ammoniacal gases are obtained and decomposition of valuable substances are avoided.

351,865—November 2, 1886. C. W. ISBELL. *Process of concentrating ammoniacal liquor.*

A suitable quantity of the weak liquor is supplied to a closed heating vessel, and also a further quantity of the weak liquor to a receiving vessel submerged in cooling water, then the liquor is heated in the heated vessel, the ammonia vapor driven off passed through a cooling worm above the heating vessel, so that all aqueous vapor will be condensed and returned to the heating vessel, and finally the ammonia vapor is introduced into the weak liquor in the receiving vessel to increase the strength thereof.

352,287—November 9, 1886. J. YOUNG, DEC'D. *Process of producing currents of liquids in vacuo.*

In the separation of ammonia from sewage or other liquids in a vacuum, the force of the liquid entering the vacuum chamber is employed to operate a pump for the removal of the liquid from the chamber.

356,610—January 25, 1887. W. YOUNG AND G. T. BEILBY. *Process of and apparatus for obtaining ammonia from coal.*

The process of treating coal, shale, and other substances to obtain ammonia and ammoniacal compounds consists in heating the material to a temperature sufficient to separate its volatile matter, which latter is exhausted from the retort, passed through a condenser, and the noncondensable gases returned to the retort to aid the combustion and prevent the carrying off of air or fire gases by supplying any excess of the exhaust.

367,992—August 9, 1887. P. J. McMAHON. *Process of preparing anhydrous ammonia.*

The method consists in evaporating concentrated ammonia, separating the weaker solution resulting from said evaporation and conducting it to a receptacle, and continuously and directly conducting any aqueous vapors arising therefrom to and re-evaporating the same with the concentrated ammonia being treated. Impurities taken up by the reabsorbing liquid of a motor or other apparatus are removed and a uniform strength of liquid ammonia maintained in the system, by heating the same to expel the gases therefrom and conducting said gases to the ammonia tank, discharging the residuum, and adding to the liquid in the system water sufficient to absorb the quantity of gas collected from the reabsorbing liquid.

371,187—October 11, 1887. T. B. FOGARTY. *Process of and apparatus for making ammonia.*

Relates to modifications of No. 371,186 (Sulphites and Sulphates); as a subprocess steam is introduced in excessive volumes simultaneously with the nitrogen gas in the same superheated retort and at about the same point.

374,618—December 13, 1887. W. F. NAST. *Obtaining ammonia from manure, etc.*

Ammonia is extracted from manure or other organic matters by adding an alkaline base, treating with sodium chloride (5 per cent lime and 2 per cent sodium chloride) in a closed vessel at a high temperature—about 150° C.—and passing the vapors through an acid bath.

379,487—March 13, 1888. L. MOND. *Obtaining ammonia and hydrochloric acid.*

The vapor of ammonium chloride is passed through a vessel containing one or more salts or oxides—as the protoxide of nickel—whereby ammonia is produced and collected. The residual ammonia is then driven off by means of a neutral gas, and collected, and superheated steam is then injected to form hydrochloric acid and complete the cycle of operations. The process is then repeated.

379,488—March 13, 1888. L. MOND. *Obtaining ammonia and chlorine from ammonium chloride.*

Process No. 379,487 is modified by injecting hot, dry air in lieu of steam, producing chlorine instead of hydrochloric acid.

381,832—April 24, 1888. F. EGNER. *Process of obtaining ammonia and bone-black.*

In the manufacture of bone-black and ammonia, the gaseous products of the bone retorts are mixed with gas from a gas producer, the ammonia is then removed therefrom, and the gas is then consumed in the furnaces, to heat the retorts.

389,781—September 18, 1888. W. WEBSTER, JR. *Process of electrolyzing sewage and sea-water.*

See Group X, Electro-chemistry.

396,705—January 22, 1889. E. MEYER. *Obtaining ammonia and oxalic acid from sugar waste.*

A solution of a caustic akali is heated and a predetermined quantity of concentrated desacharized lye, or its equivalent, in the form of molasses, is gradually added at intervals with continued heat. The caustic alkali must be in excess of the organic matter—at least 8 times, but not to exceed 20. The oxalic salts are separated from the resultant mass, and the alkaline residue rendered caustic and again used.

417,777—December 24, 1889. T. B. FOGARTY. *Process of making ammonia.*

In the manufacture of ammonia by the cyanide process, incandescent gases and air to burn the gases are introduced into a moving mixture of pulverized carbon and alkali and they travel together, as in a descending column, producing alkaline cyanides and cyanates, steam being subsequently introduced to produce ammonia and other products.

417,778—December 24, 1889. T. B. FOGARTY. *Process of making ammonia.*

As a modification of the process of No. 417,777, the air is in excess of the quantity required to burn the gases.

417,779—December 24, 1889. T. B. FOGARTY. *Apparatus for making ammonia.*

Apparatus for the processes Nos. 417,777 and 417,778.

454,108—June 16, 1891. H. E. BAUDOUIN AND E. T. H. DELORT. *Manufacture of ammonia from sodium nitrate.*

Nitrate of soda is mixed with a suitable hydro-carbon, as tar or coal, and heated to a temperature sufficient to decompose the hydro-carbon, 800° to 900° C., whereby the resulting hydrogen decomposes the nitrate and forms ammonia with carbonate of soda as a by-product.

459,193—September 8, 1891. A. HENNIN. *Process of making ammonia and gas.*

Gas and ammonia are simultaneously produced from coal by injecting air and steam into a bed of incandescent fuel and controlling the temperature of the generator by regulating the proportions of steam and oxygen or air, and by regulating the supply of fresh fuel above the zone of combustion.

477,089—June 14, 1892. H. VON STROMBECK. *Process of purifying ammonia.*

Crude ammonia-gas is purified by exposing it to the action of comminuted metallic sodium, which combines with the alcholic bodies.

486,647—November 22, 1892. L. STERNBERG. *Process of obtaining ammonia or other salts from molasses.*

The waste lyes resulting from the extraction of sugar or the manufacture of alcohol from molasses are freed from any excess of lime, strontia, and baryta, and concentrated to, say, 45° Baumé, then mixed with a carrier, as granulated coke, dried, and calcined in an atmosphere of superheated steam, producing ammonia gas, which is condensed and treated for the production of ammonia sulphate or otherwise, and the potassium and other salts recovered.

488,207—December 20, 1892. P. KUNTZE. *Process of and apparatus for making ammonia.*

Nitrogenous material, such as peat, is dried and then calcined, and the aqueous and the tarry vapors conducted off separately; the latter passed through incandescent material—as calcareous porous tar coke—forming tar, ammonia, and combustible gas. The calcined material is simultaneously treated with heated air and the aqueous vapor to form ammonia and heating gases, the latter being utilized for heating the air and calcining the nitrogenous material.

500,650—July 4, 1893. T. B. FOGARTY. *Apparatus for and process of obtaining combined nitrogen and fuel gases.*

A producer gas, consisting chiefly of the oxides of carbon, free nitrogen, and hydrogen, is formed and mingled with hydrocarbon vapors and highly heated, and then passed along with a falling pulverized carbon-alkali mixture and in the same direction, producing alkali cyanides, ammonia, and fuel gas.

500,651—July 4, 1893. T. B. FOGARTY. *Method of and apparatus for producing cyanides and ammonia.*

Nitrogenous gas, hydrocarbon gases and vapors, and a suitable alkali are passed together in a falling column through an incandescent retort, and produce alkaline cyanides, ammonia, and fuel gas.

505,427—September 19, 1893. G. L. VAIL AND T. CHARLTON. *Process of purifying ammonia gas.*

The process consists in passing the gas under a pressure of nine to twelve atmospheres, approximately, through a quantity of aqua ammonia at a temperature sufficiently low, as 56° F., to remove by condensation the moisture and other impurities with which the gas is laden; the aqua ammonia containing such a per cent of ammonia gas, say from 29 per cent to 32 per cent by weight, that it has practically reached the limit of gas absorption.

515,909—March 6, 1894. H. A. FRASCH. *Art of manufacturing ammonia.*

The ammoniacal liquor is distilled, the vapors cooled and the condensed matter separated, and the cooled and dehydrated ammoniacal vapors are then passed through a saturated solution of ammonia maintained at a temperature which adapts it to take up the pyridin and kindred impurities and thus act as a washer for the ammonia gas. The vapors are then absorbed.

518,428—April 17, 1894. E. SOLVAY. *Process of purifying ammonia.*

The process of purifying a flowing stream of ammonia liquor consists in raising the temperature of separate portions of said stream to unequal heat increasing in the direction of flow, and thereby evolving carbonic anhydride and sulphureted gases from the warmer portion, passing the evolved gases through the cooler portions of said liquor for preventing the escape of ammonia, evolving similar gases from said cooler portions, passing said gases through an independent cooler portion of said liquor, and finally passing the heated vapors thereof in proximity to and in a direction opposite to the flow of said stream of liquor for heating the same unequally.

521,401—June 12, 1894. T. CHARLTON AND K. M. MITCHELL. *Process of and apparatus for manufacturing aqua ammonia.*

A superheated mixture of air and steam is passed through ammoniacal liquor and through a condenser and absorbers; the strong liquor withdrawn from the first absorber; and the residuum liquor returned in the reverse direction from the last to the first absorber.

522,357—July 3, 1894. L. STERNBERG. *Apparatus for obtaining ammonia.*

Apparatus for process No. 523,819.

523,819—July 31, 1894. L. STERNBERG. *Process of making ammonia.*

Ammonia is produced from nitrogenous organic matter by calcining such material in a retort in an atmosphere of steam and of hot nonoxidating gas or gases. The gases and vapors discharged from the retort are freed from ammonia by means of sulphuric acid and returned to the retort.

528,999—November 13, 1894. L. TRALLS. *Process of obtaining fertilizers from waste lyes.*

Lyes—obtained by leaching brown coal ashes—containing acid salts of alumina and oxide of iron, and waste ammoniacal liquor are mixed in such proportions as to convert the sulphuric acid combined with the aluminium and iron oxide into ammonium sulphate and leave the alumina in the form of a hydrate, and the peroxide of iron in the form of a hydroxide, and evaporated to dryness.

547,276—October 1, 1895. L. MOND. *Process of and apparatus for obtaining ammoniacal products.*

In the extraction of ammonia and tar from producer gases, the hot gases are cooled with water, and the air for the producer is heated by the water, the cooling and heating alternating. The free ammonia is separated by a weakly acid solution of a salt of ammonia, the tar separated from the solution, and the solution brought up to the required strength of acid and again utilized.

557,166—March 31, 1896. L. STERNBERG. *Process of obtaining ammonia from waste sugar lyes.*

Gaseous nitrogenous organic compounds are transformed into ammonia by conducting the gases over a glowing contact body composed essentially of an aluminate, as the aluminate of potassium. Waste lyes from the extraction of sugar or the manufacture of alcohol from molasses are concentrated to, say, 75 Brix, then mixed with alumina and an aluminate forming a plastic mass, molded into bricks, dried, and heated in a retort to incandescence.

578,457—March 9, 1897. C. KELLNER. *Process of and apparatus for simultaneously producing ammonia, sodium hydroxid, and chlorin.*

See Group X, Electro-chemistry.

583,262—May 25, 1897. H. J. KREBS. *Process of and apparatus for distilling ammonia.*

An aqueous solution of ammonia is continuously fed into a still and a current of high pressure steam from a steam boiler is discharged into the still; the gas is conveyed away and cooled, and the residual water and the condensed steam are fed back to the steam boiler.

586,950—July 20, 1897. F. W. A. FRERICHS. *Process of purifying ammonia.*

Commercial water of ammonia, while under pressure, is subjected to a temperature of at least 180° C. and preferably higher, to set free all of the permanent gases which can develop under conditions prevailing in ice machines, which gases are removed and the resulting ammonia gas liquefied; it may then be subjected to distillation at a low temperature, preferably from 10° to 20° C. to condense and separate out the carbon compounds.

598,195—February 1, 1898. T. F. COLIN. *Process of making cyanids and ammonia.*

Powdered heated alkali is continuously showered into a closed furnace shaft, into the base of which there is directly and separately introduced, under pressure, highly heated air and fuel gas, and above the latter a heated liquid hydrocarbon; the successive steps effected being the combustion of air and gas, the dissociation of the liquid hydrocarbon, and the dissociation of the alkali and formation of cyanides; followed, outside of the furnace, by the decomposition of the cyanides by steam, and the formation of ammonia.

598,918—February 15, 1898. T. B. FOGARTY. *Process of and apparatus for making cyanids and ammonia.*

Prior to bringing producer gas into contact with a shower of pulverized alkalized carbon to form alkaline cyanides, an adjusted quantity of highly heated air is added to effect further combustion, and pulverized anthracite coal or coke or material rich in free carbon is showered through the gases to remove all oxygen and carbonic-acid gas.

607,943—July 26, 1898. H. MEHNER. *Method of producing ammonia.*

See Group X, Electro-chemistry.

Other hydroxides.

144,517—November 11, 1873. C. M. T. DU MOTAY. *Improvement in the manufacture of baryta.*

Sulphate of barium, mixed with coal, is reduced to sulphuret of barium and then transformed into hydrated baryta, or into carbonate of baryta, the intermediate reagents used being revivified and reused.

159,446—February 2, 1875. C. H. PHILLIPS. *Improvement in manufacturing milk of magnesia.*

Magnesia hydrate is prepared by subjecting a soluble salt of magnesia—as magnesia sulphate—to the action of ammonia.

326,066—September 8, 1885. W. G. STRYPE. *Process of making hydrates of barium and of strontium.*

A solution of sulphide of barium or strontium is subjected to the action of air forced up through the solution in the presence of an oxide of iron, such as ochre or other hydrated ferric oxide.

328,478—October 20, 1885. H. C. FREIST. *Manufacture of hydrate of alumina.*

A mixture of pulverized aluminous material, sulphate of soda, carbonate of lime, coal dust, and fluorspar is subjected to a high heat; the mass leached, and the solution, either before or after removal of insoluble impurities, treated with a metallic peroxide, sesquioxide, or hyperoxide to precipitate the iron in insoluble form; which precipitate is removed and the clear liquor subjected to the action of carbonic-acid gas to form a carbonate of soda and precipitate the alumina as hydrate of alumina.

331,182—November 24, 1885. G. F. BIHN. *Method of obtaining hydrate of alumina for paper makers' use from bauxite, etc.*

To produce an artificial hydrate of alumina free from iron, an intimate mixture of bauxite, salt cake, and coal is calcined, the mass lixiviated with water, and the liquor, separated from the insoluble matter, boiled with finely divided metallic copper or a suitable copper compound. The resulting liquor, separated from insoluble matter, is then treated with carbonic-acid gas or bicarbonate of soda, precipitating hydrate of ammonia.

539,889—May 28, 1895. M. N. D'ANDRIA. *Process of making magnesium hydrate.*

Calcined and slacked dolomite is subjected to the action of water, repeatedly agitated, settled, and decanted until the residue is mainly magnesium hydrate. Large tanks into which the tide can flow are preferably used.

571,533—November 17, 1896. R. LANGHANS. *Electrolytic process of converting hydroxids of earth and earth alkali metals into indissolubte organic or inorganic salts, etc.*

See Group X, Electro-chemistry.

CHLORATES.

388,217—August 21, 1888. E. K. MUSPRATT AND G. ESCHELLMANN. *Manufacture of sodium-chlorate.*

Magnesia suspended in water by agitation is treated with chlorine, the resulting magnesian liquor boiled down to crystallize out magnesium chloride, and the liquor then decomposed by means of caustic soda or carbonate of soda, or mixtures of the same, to produce sodium chlorate.

388,997—September 4, 1888. E. K. MUSPRATT AND G. ESCHELLMANN. *Manufacture of potassium chlorate.*

In the manufacture of potassium chlorate by means of magnesia and chlorine the magnesia liquor is boiled down to crystallize out magnesium chloride, the liquor is then heated with potassium chloride, and the potassium chlorate separated from the magnesium chloride by crystallization. The mother liquor is now treated with hydrochloric acid and steam to obtain chlorine and magnesium chloride.

480,492—August 9, 1892. E. B. CUTTEN. *Method of electrolytically producing potassium chlorate.*

See Group X, Electro-chemistry.

480,493—August 9, 1892. E. B. CUTTEN. *Method of electrolytically producing potassium chlorate.*

See Group X, Electro-chemistry.

491,701—February 14, 1893. E. B. CUTTEN. *Method of electrolytically producing potassium chlorate.*

See Group X, Electro-chemistry.

492,003—February 21, 1893. H. GALL AND A. DE VILLARDY DE MONTLAUR. *Manufacture of chlorates of the alkaline metals and metals of the alkaline earths.*

See Group X, Electro-chemistry.

493,023—March 7 1893. W. T. GIBBS AND S. P. FRANCHOT. *Process of obtaining chlorates of the alkalis or of the alkaline earth metals by electrolysis.*

See Group X, Electro-chemistry.

519,400—May 8, 1894. H. BLUMENBERG, JR. *Electrolysis.*

See Group X, Electro-chemistry.

536,848—April 2, 1895. H. BLUMENBERG, JR. *Electrolysis.*

See Group X, Electro-chemistry.

537,179—April 9, 1895. H. BLUMENBERG, JR. *Electrolysis.*

See Group X, Electro-chemistry.

538,314—April 30, 1895. K. J. BAYER. *Process of producing potassium chlorate.*

Zinc oxide (used in place of lime) is treated with chlorine gas; the hypochlorite of zinc obtained is split into zinc chlorate and zinc chloride; the solution is mixed with potassium chloride, and the potassium chlorate separated by crystallization, while the zinc is obtained in the liquor in the form of zinc chloride.

543,326—July 23, 1895. K. J. BAYER. *Process of producing potassium chlorate.*

Potassium chloride is added to a mixture of zinc oxide and water up to the saturation point of the mixture, the solution is heated to near the boiling temperature, and chlorine is introduced until the zinc oxide is dissolved, when the potassium chlorate is crystallized out and the zinc chloride liquor is concentrated.

565,324—August 4, 1896. H. BLUMENBERG, JR. *Electrolysis.*

See Group X, Electro-chemistry.

587,437—August 3, 1897. F. HURTER. *Apparatus for manufacturing chlorate of potash by electrolysis.*

See Group X, Electro-chemistry.

620,683—March 7, 1899. T. A. UEHLING. *Process of and apparatus for reducing and oxidizing salts.*

See Group X, Electro-chemistry.

627,000—June 13, 1899. P. IMHOFF. *Process of making oxyhalogen salts.*

See Group X, Electro-chemistry.

627,063—June 13, 1899. P. IMHOFF. *Manufacture of oxyhalogen salts.*

See Group X, Electro-chemistry.

633,272—September 19, 1899. T. PARKER. *Process of manufacturing chlorates by electrolysis.*

See Group X, Electro-chemistry.

NITRITES AND NITRATES.

249,275—November 8, 1881. T. VARNEY. *Process of drying nitrates.*

A portion is melted and mixed with an unmelted crystalline portion, thereby expelling the water from the crystals.

400,207—March 26, 1889. C. N. HAKE. *Process of making ammonium nitrate.*

Nitric-acid vapor is combined with ammonia gas in an air chamber or ammonia-gas with fine spray of nitric acid with the temperature maintained below 120° C. Nitrate of ammonia is produced in the first case as a fine powder and in the second case as a supersaturated liquid which solidifies on cooling.

448,361—March 17, 1891. R. S. PENNIMAN. *Process of manufacturing nitrate of ammonia.*

Protected nitrate of ammonia is produced by dehydrating the nitrate and while it is in a melted condition mixing therewith a protecting medium, as any of the soft products of petroleum distillation—e. g., vaseline—then cooling and graining by agitation.

448,362—March 17, 1891. R. S. PENNIMAN. *Preparing nitrate of ammonia.*

The nitrate is dehydrated while in a melted condition by mechanical agitation accompanied with the injection of air. It is then cooled and grained by mechanical agitation and a protecting medium, as vaseline, is applied to the mass.

478,067—June 28, 1892. R. S. PENNIMAN. *Method of manufacturing nitrate of ammonia.*

Nitrate of ammonia liquefied under a high temperature is subjected to mechanical agitation together with injected blasts of air to prevent decomposition from overheating and to fully eliminate watery vapors.

500,914—July 4, 1893. J. LANDIN. *Process of making ammonium nitrate.*

Alcohol is percolated through a mixture of sodium nitrate and ammonium sulphate to produce an alcoholic solution containing ammonium nitrate plus some sodium nitrate, and a residue of sodium sulphate plus some ammonium sulphate. The alcoholic solution is treated by passing it first through ammonium sulphate, and next through ammonium chloride, producing an alcoholic solution of ammonium nitrate and a precipitate of sodium sulphate and sodium chloride, and the sodium chloride is then sublimed with the mixture of sodium sulphate, and ammonium sulphate to produce sodium sulphate and ammonium chloride.

572,819—December 8, 1896. L. G. PAUL. *Process of making nitrites.*

An alkaline nitrate is melted together with the caustic compound of the same alkali, and sulphur is gradually added to the melted mass.

573,964—December 29, 1896. G. CRAIG. *Process of purifying ammonium nitrate.*

Nitrate of ammonia is dissolved out of mixtures by percolating or digesting with anhydrous or high-strength ammonia, and then the solvent is evaporated off.

595,178—December 7, 1897. A. KNOP. *Process of making nitrites.*

A nitrite is manufactured by heating a mixture of a nitrate, a caustic alkali, and carbon. Fused caustic soda, 120 parts, and coke, 31 parts, are first mixed and cooled. Then 300 parts of saltpeter are melted with 120 parts of 90 per cent caustic soda, and the first mixture added in fragments.

597,006—January 11, 1898. R. N. LENNOX. *Process of making ammonium nitrate.*

A mixture of sulphate of ammonia, 13 parts, and a nitrate of a metal capable of double decomposition, as sodium nitrate, 17 parts, is distilled at less than atmospheric pressure, and at a temperature not exceeding 230° C.

632,394—September 5, 1899. H. K. BAYNES. *Process of decomposing alkali nitrates.*

See Group I, Acids, Nitric.

623,893—April 25, 1889. T. FAIRLEY. *Process of making ammonium nitrate.*

Bicarbonate of ammonium is subjected to the action of a saturated solution of sodium nitrate, the liquid separated from the moistened solid, and the former cooled to about 15° C. to crystallize out the ammonium nitrate.

SULPHITES AND SULPHATES.

17,830—July 21, 1857. L. GAMOTIS AND S. MARTIN. *Improved apparatus for making acid sulphite of lime.*

The fumes from burning sulphur are drawn by suction successively through a series of vats filled with milk of lime.

59,239—October 30, 1866. G. T. LEWIS. *Improvement in the manufacture of sulpho-acetate of alumina.*

Alumina (obtained from cryolite) is treated with acetic acid and sulphuric acid, or in place of the latter sulphate of alumina or alum.

82,154—September 15, 1868. W. M. PAGE AND E. B. KRAUSSE. *Improved process of preparing sulphate of barytes.*

Sulphate of baryta is first boiled in water to render it more friable, then dried, and boiled in a weak acid solution—as of sulphuric acid—followed by a weak solution of silicate of soda to purify, then boiled in a saturated alum solution to whiten, and dried and pulverized, to be subsequently mixed in distilled water and floated for a fine product.

108,177—October 11, 1870. H. PEMBERTON. *Improvement in the manufacture of paper.*

Sulphate of lime, for use in paper manufacture, is made from a solution of calcium chloride, for which bittern may be used, and a solution of impure soda sulphate or niter cake.

11,305—January 31, 1871. R. DE WITT BIRCH. *Improvement in the manufacture of copperas.*

The waste liquor from manufactures using sulphuric acid for cleaning iron is settled, the free acid neutralized with wrought iron, concentrated to from 28° to 40° Baumé, the vapors being passed over lime to a condenser, the liquor settled and crystallized on crystallizing sticks, and the crystals dried with air warmed by the hot vapors.

125,153—April 2, 1872. H. A. WHITING. *Improvement in processes and apparatus for the manufacture of sulphate of lead.*

Sulphate of lead is manufactured by the direct action of hot concentrated sulphuric acid upon an alloy of lead and zinc, 1 per cent zinc. The dried sulphate of lead is whitened by calcining at a red heat.

151,389—May 26, 1874. J. HARGREAVES AND T. ROBINSON. *Improvement in the manufacture of sulphate of soda and potassa.*

Mixed sulphurous-acid gas, air, and water vapor are used in the proportions of 2 volumes each of gas and water vapor, and air to furnish 1 volume of free oxygen, the mixture being passed through the chambers in series, each in turn being the first of the series. Sodium chloride, or potassium chloride, is used in pieces containing about three-quarters of a cubic inch, with the smaller pieces packed near the sides of the chamber, or tower.

195,998—October 9, 1877. L. S. FALES. *Improvement in treating gas-liquor for ammonia salts.*

The incoming ammoniacal liquor is heated by means of the sulphureted-hydrogen gas, and the latter thereby cooled previous to passing it into water to absorb it, in the manufacture of sulphate of ammonia.

200,134—February 12, 1878. C. FAHLBERG. *Improvement in processes for utilizing zinc sulphate.*

Zinc sulphate is treated with sodium carbonate or bicarbonate to precipitate the zinc as a carbonate, and the sodium bicarbonate is then recovered by an ammonio-soda process.

216,323—June 10, 1879. H. GROUVEN. *Improvement in the manufacture of sulphate of ammonia.*

Sulphate of ammonia is made from turf and similar material by decomposing the vapors and gases obtained from heating a mixture of turf and chalk by means of a contact mass; converting the carbonate of ammonia to sulphate of ammonia in the presence of sulphate of lime, and purifying and crystallizing the sulphate of ammonia.

220,005—September 23, 1879. Z. C. WARREN. *Improvement in the manufacture of sulphate of lime.*

Sulphate of lime, of about the specific gravity of paper pulp, is made by commingling cooled streams of milk of lime and sulphuric acid prepared in combining proportions.

224,101—February 3, 1880. W. J. MENZIES. *Process for the maufacture of sulphate of soda.*

A pure sulphate of soda is obtained from niter cake and muriatic-acid cylinder-cake, by neutralizing the free acid of the one and the free sodium chloride of the other, treating them in a reverberatory furnace, either together or singly, with the addition, respectively, of sodium chloride or sulphuric acid, and then precipitating the iron salts and impurities from a hot saturated solution of the product with an alkali or alkiline earth and bleaching-powder. An anhydrous sulphate of soda is produced, white and free from iron.

229,249—June 29, 1880. C. N. HAKE. *Manufacture of potassium sulphate from kainit.*

A solution of magnesium sulphate is added to ground kainit, the chlorides of magnesium and sodium going into solution while a residue of schönit is formed, the schönit being separated from the said chlorides by decantation. Caustic lime, baryta, or strontia is added to pulverized schönit and the product calcined, lixiviated, and concentrated to secure the potassium sulphate.

243,310—June 21, 1881. C. SCHEIBLER. *Process of separating gypsum from the solutions of starch-sugar produced by treating the latter with sulphuric acid.*

The solution is neutralized by means of lime, the bulk of the gypsum removed by filtration or decantation, and the solution then treated with an excess of barium-oxalate or other insoluble barium salt obtained from a soluble oxalate and which forms an insoluble combination with lime, the remaining gypsum being removed with the scum during concentration.

247,046—September 13, 1881. H. GROUVEN. *Process of and apparatus for making ammonium sulphate.*

As an improvement on the process of No. 216,323, the peat, or animal refuse rich in nitrogen, is charged successively into a series of retorts, and the vapors and gases are passed through all in series ending with the one longest charged.

259,150—June 6, 1882. F. HOHLWEG. *Process of obtaining magnesium sulphate from crude mineral.*

Crude mineral containing carbonate or silicate of magnesia is powdered and treated with a solution of sodium bisulphate and the magnesium sulphate separated by crystallization. With the addition of carbonate of soda the magnesia is precipitated from the solution as a carbonate in the usual manner.

267,582—November 14, 1882. R. N. R. PHELPS AND W. A. CLARK, JR. *Process of treating the waste pickle-liquor of iron-works.*

See Group I, Acids, Sulphuric.

286,735—October 16, 1883. H. RÖSSLER. *Process of making cupric sulphate.*

Gases containing sulphurous acid, as the waste gases of chemical works, are injected jointly with air and steam into an oxidizing solution of cupric sulphate containing free copper, as cement copper.

292,260—January 22, 1884. C. SEMPER. *Utilizing waste calcium chloride and sulphate.*

Waste calcium sulphate, produced in the manufacture of acetic acid from acetate of lime, is calcined at a high temperature and the impurities driven off.

318,972—June 29, 1885. E. A. FALES. *Process of making ammonium sulphate.*

In the distillation of ammoniacal liquor and the passage of the vapor through sulphuric acid, the acid is covered with a layer of coal oil to give white sulphate of ammonia crystals and avoid discoloration.

321,341—June 30, 1885. E. CAREY, H. GASKELL, JR., AND F. HURTER. *Process of making sodium sulphite.*

Salts—monohydrated carbonate of soda—are exposed to the action of sulphurous-acid gas.

329,216—October 27, 1885. E. B. RITTER AND C. KELLNER. *Process of making solutions of bisulphites.*

The carbonate of a base is first subjected to the action of sulphurous acid, whereby carbonic acid is expelled and the sulphite formed is dissolved in the weakened acid solution. The sulphite solution is then reimpregnated with sulphurous acid and a combination with the second base effected and the formation of a double salt.

338,558—March 23, 1886. E. B. RITTER AND C. KELLNER. *Process of manufacturing sulphites.*

In the manufacture of sulphites, sulphurous-acid gas is purified, prior to making a solution of the same, by passing it through a solid material, as limestone, which will combine with sulphuric acid, and a filter of solid material for dry particles, and then cooling the acid.

339,974—April 13, 1886. W. O. & W. P. CROCKER. *Producing sulphite or bisulphite of sodium.*

For the production of sulphite-of-sodium liquor from sulphate of sodium for the reduction of wood to pulp, the sulphate of sodium mixed with carbonaceous matter is roasted, leached, evaporated to dryness, and the product granulated, and heated with agitation in contact with air or oxygen until incandescence ceases, when it is made into a solution. It may be charged with an additional portion of sulphurous or other acid before introduction into the digester. By the addition of a small quantity of bisulphite of calcium any sulphide or sulphate of sodium is decomposed, sulphate of calcium being precipitated.

339,975—April 13, 1886. W. O. & W. P. CROCKER. *Process of making bisulphites.*

Bisulphite-of-sodium liquor is produced by roasting the acid sulphate of sodium to reduce it to neutral sulphate and recover one proportion of sulphuric acid, suspending neutral sulphite of calcium in the solution by agitation, and finally charging the mixture with sulphurous acid, which may be obtained by decomposition of the sulphuric acid recovered. The neutral sulphite of calcium is obtained by treating the used bisulphite-of-sodium liquor with oxide or carbonate of calcium.

365,318—June 21, 1887. W. M. PAGE AND E. B. KRAUSSE. *Process of and apparatus for treating barium sulphate.*

The crude material is subjected to successive steps of grinding, boiling with dilute acid, washing, drying, regrinding, agitation in hot water, screening, settling in water, and drying.

371,186—October 11, 1887. T. B. FOGARTY. *Process of and apparatus for making ammonium sulphate.*

Highly heated nitrogenous generator gas is mixed with adjusted volumes of superheated steam and air and mingled with a falling mass of pulverized carbon and alkali in a retort, producing cyanogen, which in turn is decomposed by the steam to ammonia, hydrogen and carbon oxides; the ammonia and carbonic acid being then treated with sulphuric acid and lime of gypsum to produce sulphate of ammonia and carbonate of lime.

373,264—November 15, 1887. H. BAUM. *Process of making pyrosulphates.*

Pyrosulphates of the alkali metals, as also of ammonia, are produced by heating the acid sulphates thereof in a vacuum to a temperature of from 200° to 400° C.

376,189—January 10, 1888. A. FRANK. *Production of sulphite solutions.*

Free as well as combined sulphurous acid is recovered from the lyes resulting from the manufacture of cellulose by the sulphite process, by converting the sulphurous acid into a monosulphite by means of calcium or a calcium salt, separating the monosulphite from the lye and purifying the same by washing in a solution of sulphurous acid or of an alkali sulphite or an alkaline earth.

376,190—January 10, 1888. A. FRANK. *Production of sulphite solutions.*

Acid sulphite solutions are produced from calcium monosulphite (a product of the process No. 376,189) with calcium sulphate as a by-product, by treating the calcium monosulphite with sulphuric acid or with acid sulphate of soda.

379,820—March 20, 1888. A. SCHANSCHIEFF. *New mercuric salt for battery-fluids.*

A new salt, yellow basic sulphate of mercury combined with bisulphate of mercury, substantially of the formula $2HgO,SO_4+HgSO_4+3H_2O$, is produced by dissolving mercury in sulphuric acid, evaporating excess of acid, adding water, separating the precipitate and treating it with acid and again with water; and so on, either retaining the solution in the liquid form or evaporating to obtain the solid salt.

392,286—November 6, 1888. H. PEMBERTON, JR. *Dehydrating sodium sulphate.*

The crystals of natural or artificial Glauber's salt are treated with a hot saturated solution of sodium sulphate until they melt; the anhydrous salt not in solution is then allowed to settle, and the saturated solution is run off or allowed to recrystallize to be used again.

395,159—December 25, 1888. W. MANNING. *Process of treating gypsum.*

In the treatment of gypsum for the production of an impalpable opaque anhydrous powder, it is given a second calcination and subsequent grinding to expel all water of crystallization.

407,925—July 30, 1889. C. J. E. DE HAËN. *Double sulphate of antimony.*

A new product, the double salt of fluoride of antimony and sulphate of ammonia, having the formula $SbFl_3(NH_4)_2SO_4$—available in the dyeing art in lieu of tartar emetic—is produced by mixing fluoride of antimony and sulphate of ammonia and evaporating the mixture.

415,739—November 26, 1889. H. A. SEEGALL. *Process of making chromium sulphates.*

Chromic or chromous sulphates are produced from chrome materials by heating the same to 600° C. in closed receptacles with the acid sulphates of any fixed alkali, such as sodium bisulphate, with the chrome materials held in suspension by agitation; and then condensing the vapors and regaining the sulphuric acid which has not entered into the reaction. The quantity of vapor is reduced by mixing with the mass a substance that does not melt or decompose at 600° C., as barium sulphate.

452,378—May 19, 1891. P. DE LACHOMETTE. *Process of making ammonium-sulphite.*

Crude ammoniacal liquor is first purified with oxide of iron and then distilled; the oxide of iron used is roasted, and the dry ammonia from the distillation and the sulphurous gas from the roasting, conducted in suitable proportions into a saturating tank, form ammonium sulphite or bisulphite.

452,386—May 19, 1891. H. PENNINGTON. *Process of making lead sulphate.*

Metallic lead in shreds or flakes is subjected to the alternate action of dilute acetic acid and of atmospheric air; the mass of lead is drained and loosened up after the acetic solution is drawn off; and the said solution is mixed with a sufficient quantity of sulphuric acid to thoroughly reduce the lead acetate to a lead sulphate without excess of free sulphuric acid, the solution being agitated to prevent the formation of acicular crystals and leave the sulphate practically amorphous.

453,137—May 26, 1891. J. VAN RUYMBEKE. *Process of makingbasic persulphate of iron.*

Pulverized iron ore—oxide of iron—is first mixed with sulphuric acid and then heated to from 190° to 260° C. until the water has been expelled and a persulphate of requisite basicity is produced.

503,900—August 22, 1893. W. E. CASE. *Process of making aluminium fluosulphate.*

Aluminium fluosulphate free from iron is produced by adding calcium fluoride to an aqueous solution of crude aluminium sulphate, then adding a quantity of the freshly precipitated white product obtained by adding a solution of an alkaline carbonate to an aluminium fluosulphate solution which has been freed from iron. The resulting ferruginous precipitate is separated from the fluosulphate solution by mechanical means.

504,324—September 5, 1893. W. E. CASE. *Process of making aluminium compounds.*

An insoluble aluminium compound is produced by combining aluminium sulphate and calcium fluoride to form an aluminium fluosulphate solution, and adding an alkali carbonate. If iron is present the alkali carbonate is added until a filtered test sample shows the solution free of iron in the ferric form; the iron precipitate is then removed and additional alkali carbonate added to precipitate the aluminium compound.

504,325—September 5, 1893. W. E. CASE. *Process of making aluminum fluosulphate.*

An aluminium alkali fluosulphate free from iron is produced by adding calcium fluoride to an aqueous solution of crude aluminium sulphate, then adding a solution of an alkaline carbonate, as of sodium carbonate, to precipitate iron, and separating the aluminium fluosulphate solution from the solid products.

512,103—January 16, 1894. W. E. CASE. *Process of making aluminum compounds.*

An insoluble aluminium compound is formed by combining aluminium sulphate and calcium fluoride to form an aluminium-fluo-sulphate solution, adding thereto a caustic alkali, as ammonium hydrate, to precipitate the iron, removing the iron, and then adding a further quantity of the caustic alkali to precipitate the aluminium compound.

514,040—February 6, 1894. H. F. D. SCHWAHN. *Process of purifying native sulfate of barium.*

The process of No. 514,039 (Group XIX, Oxides) is specifically applied to the purification of native sulphate of barium from iron, etc.

515,763—March 6, 1894. C. VON GRABOWSKI. *Process of and apparatus for purifying sulfate lyes.*

See Group X, Electro-chemistry.

526,076—September 18, 1894. M. L. GRIFFIN. *Process of making calcium bisulfite liquor.*

To prepare "lime sludge," resulting from the treatment of carbonated-soda liquors with lime in the manufacture of caustic soda, for use as a substitute for lime in the manufacture of bisulphite liquors, it is washed to remove the alkali, flowed over riffles to remove heavy impurities, and the precipitate of carbonate of lime thus purified is separated from the water by settling or filtering. The sludge is then charged with sulphurous-acid gas.

541,598—June 25, 1895. J. D. DARLING. *Process of utilizing niter-cake or other acid sulfates.*

See Group X, Electro-chemistry.

542,429—July 9, 1895. E. A. STARKE. *Process of making neutral alkaline sulfates from bisulfates.*

Neutral alkaline sulphate is made by adding a portion of sulphur to the acid sulphate and heating the mass. The sulphurous acid fumes are collected and converted into sulphuric acid.

543,002—July 23, 1895. S. H. EMMENS. *Process of making ferric sulfate.*

The gases from a sulphuret or sulphate roasting or calcining furnace are passed into water in which ferric hydrate is suspended.

565,953—August 18, 1896. E. ANDREOLI. *Apparatus for indirect electrolysis.*

See Group X, Electro-chemistry.

601,006—March 22, 1898. H. E. STURCKE. *Preparing sulfate of lime from residues.*

Residues from the manufacture of caustic soda, and comprising essentially carbonate of lime, are dissolved in muriatic acid, filtered, precipitated with sulphuric acid to form sulphate of lime, filtered, and the sulphate of lime washed and dried. The last filtrate is used for treating fresh quantities of residues. A waste calcium-chloride solution from the ammonium-soda process is filtered, precipitated with sulphuric acid to form sulphate of lime, and filtered, and the last filtrate used for caustic soda residues.

601,179—March 22, 1898. H. E. STURCKE. *Process of and apparatus for making sulfate of lime.*

Residues from the manufacture of caustic alkali, comprising essentially carbonate of lime, are made into a thin milk, the insoluble impurities are mechanically removed, and the milk of carbonate is then treated with sulphuric acid to convert the carbonate into sulphate of lime, which is separated out and dried.

605,697—June 14, 1898. R. E. CHATFIELD. *Process of utilizing acid sulfates of soda.*

Residue acid sulphate of soda solutions are acted upon by ammoniacal compounds from gas liquor or other sources to produce mixed sulphates of ammonia and soda. The solution is then evaporated to a specific gravity of 1.380 at boiling temperature to crystallize out sulphate of soda; the evaporation is then continued to crystallize out the mixed salts, which latter crystals are dissolved in cold mother liquor to a specific gravity of 1.285 and evaporated to crystallize out sulphate of ammonia.

634,751—October 10, 1899. O. HOFMANN. *Method of refining cupric-sulfate solutions.*

A cupric-sulphate solution containing salts of iron, arsenic, antimony, etc., is neutralized and heated to 75° to 80° C., when pulverized cupric oxide is added and air is injected to precipitate the impurities.

640,026—December 26, 1899. A. S. RAMAGE. *Process of and apparatus for making copperas.*

Carbonate of magnesium is added to the waste liquor of pickling vats to neutralize the free sulphuric acid, and the liquor is then filtered, evaporated, and crystallized, giving a copperas mixed with a little magnesium sulphate which improves the same for the manufacture of venetian red.

641,550—January 16, 1900. M. E. ROTHBERG. *Process of making magnesia and plaster of paris.*

See Group XIX, Oxides.

650,980—June 5, 1900. O. MEURER. *Process of making metallic sulfates.*

To produce sulphates free from iron from sulphide ores containing sulphide of iron, the ores are heated with polysulphides of the alkalis, cooled and caused to be crumbled in the air, after the addition of water; dried and subjected to spontaneous oxidation in air preferably at 205° C. The mass is then lixiviated with water and the sulphates are dissolved.

PHOSPHATES.

42,140—March 29, 1864. E. N. HORSFORD. *Improved double phosphate of lime and soda for culinary and other purposes.*

To a mixture of 5,000 pounds of water and 500 pounds of oil of vitriol there is added 700 pounds of burned bones and constant agitation is continued for sixteen to eighteen hours, when the mass is leached and lixiviated, forming a liquid acid phosphate of lime, in which about two-ninths of the lime of the original phosphate of lime remains in combination with the phosphoric acid. This is concentrated with the addition of hydrate of soda in the proportion of 0.0144 of a pound for each degree of Baumé until it becomes an emulsion of crystals. The product is rendered nonhygroscopic by diluting the emulsion of crystals with gelatinized water, and subjecting to slow crystallization, and potato starch is mixed therewith, or it is treated with a weak solution of boiled starch.

62,277—February 19, 1867. J. E. LAUER. *Improved acid compound for use in baking and cooking.*

An acid salt, obtained by treating boneblack with hydrochloric acid and then adding sulphuric acid to the liquor.

75,271—March 10, 1868. E. N. HORSFORD. *Improved preparation of acid phosphate of lime.*

Sulphuric acid is added to a solution of acid phosphate of lime in a solution of a salt of lime, the acid of which salt is volatile, as nitric acid, and the volatile acid driven off by heat, leaving acid phosphate of lime mixed with or feebly combined with sulphate of lime, which is separated by leaching.

75,328—March 10, 1868. G. F. WILSON. *Improvement in the manufacture of acid phosphates.*

Farinaceous matter is mixed with acid phosphate of lime by feeding a coarse mixture of the material between rollers, preferably of dressed granite.

75,329—March 10, 1868. G. F. WILSON. *Improvement in preparing bones for the manufacture of acid phosphates.*

Bones are distilled in horizontal retorts with condensation of the products of distillation, the remaining gases being conveyed to the furnace and burned. Each charge of distilled bone is raked from the retort into an iron cooler which is sealed and the bone cooled under exclusion of air.

75,330—March 10, 1868. G. F. WILSON. *Improvement in drying acid phosphates.*

Granulated acid phosphate of lime is exposed to continuous currents of heated air on both sides of vertical columns thereof, which are progressively fed downward.

75,332—March 10, 1868. G. F. WILSON. *Improvement in burning bones for the manufacture of acid phosphates.*

Bones are burned white by subjecting them to a steady, long-continued, uniform heat, with sufficient regulated air to secure perfect combustion without cooling off the furnace, the temperature of distillation being not for once intermitted.

75,336—March 10, 1868. G. F. WILSON AND E. N. HORSFORD. *Improvement in the manufacture of phosphates and in extracting phosphoric acid from bones.*

Burned bones are treated with sulphuric acid diluted with a weak solution of acid phosphate of lime to or beyond the point of precipitating the sulphate of lead present, and the mixture is treated with continuous agitation.

The material is leached in broad shallow pans with alternate affusion of water and tamping to secure leaching of the whole mass.

76,763—April 14, 1868. E. N. HORSFORD. *Improved method of preparing acid phosphate of lime.*

Sulphuric acid purified of sulphate of lead is employed in the manufacture of pulverulent acid phosphate of lime, to be used for raising bread.

86,289—January 26, 1869. A. DUVALL. *Improved method of mixing liquids with dust or powder for the manufacture of phosphates, and for other purposes.*

The pulverized material and the acid are fed into a blast of air or jet of steam, either or both, and thereby thoroughly mixed and projected into a receiving chamber.

110,680—January 3, 1871. N. B. RICE. *Improvement in the manufacture of acid phosphates for use in baking-powders, etc.*

To 1,000 pounds of pulverized phosphate of lime, as contained in apatite or bone, there is added 1,400 pounds of terhydrated phosphoric acid, diluted with 2,800 pounds of water, with enough more phosphoric acid to neutralize and saturate all carbonates, oxides, etc. After standing a week with frequent agitation the superphosphate of lime in solution is decanted or leached out. Part of the liquor is treated with sulphuric acid to deposit the lime in solution and leave a dilute phosphoric acid, and part is treated with alkaline sulphates depositing the lime as a sulphate and leaving a superphosphate of the base.

123,743—February 13, 1872. B. TANNER. *Improvement in the manufacture of phosphates of the alkalis.*

Monosodic, bisodic, or trisodic phosphates, or like phosphates of potash or ammonia, are produced by mixing sodium chloride, or potassium or ammonium chloride, with phosphoric acid in the proper combining proportions, and subjecting the mixture to the action of steam, superheated steam, or mixtures of hot air and steam.

123,744—February 13, 1872. B. TANNER. *Improvement in the manufacture of superphosphates of lime.*

See Group VIII. Fertilizers.

130,298—August 6, 1872. E. N. HORSFORD. *Improvement in the manufacture of phosphate of lime and yeast-powders.*

Solid monocalcic phosphate, produced by evaporating, with a current of heated air, a solution of monocalcic, orthophosphate, and free phosphoric acid, mingled with a solution of the phosphate of lime of burned bones in hydrochloric acid, in such proportions that the total number of lime atoms equals the total number of atoms of phosphoric acid. The monocalcic phosphate is mixed with starch to preserve its available strength, with alkaline carbonates to form a yeast powder, and the latter with flour for the production of self-raising flour.

137,635—April 8, 1873. F. M. LYTE AND H. STORCK. *Improvement in the manufacture of acid phosphates.*

Soluble acid phosphates are produced by attacking earthy phosphates, especially phosphate of calcium, with properly diluted phosphoric acid, precipitating the earthy matter by means of alkaline sulphates, as sulphate of ammonium, and then extracting the sulphuric acid of the residual liquor with the phosphate of barium, lead, or strontium, or the carbonates or other suitable salts of these bases. The residues are either treated with sodium carbonate, caustic soda, and the phosphoric acid precipitated from the liquid with lime, or in certain other specified ways.

140,051—June 17, 1873. J. E. LAUER. *Improvement in manufacturing crystalline acid phosphate of lime for yeast-powders.*

Boneblack is first treated with dilute sulphuric acid to deposit the sulphate of lime, and it is then treated with muriatic acid evaporated and crystallized. (See No. 62,277.)

164,457—June 15, 1875. A. JAS. *Improvement in dissolving tribasic phosphate of lime in water containing carbonic acid.*

Tribasic phosphate is dissolved in water by means of a current of carbonic acid gas, at a greater or less pressure, according to the quantity to be dissolved.

178,146—May 30, 1876. J. V. HECKER. *Improvement in acid-powders and processes of producing them.*

An acid powder consisting of monocalcic ortho-phosphate, sodium chloride, and calcium chloride: produced by treating boneblack with sulphuric acid and then with hydrochloric acid and sodium chloride, leaching and evaporating to dryness.

196,771—November 6, 1877. J. E. SIEBEL. *Improvement in processes of producing the mono or acid phosphate of ammonia.*

A mixture of ground bone-ash and sulphate of ammonia in water is subjected to a boiling heat for a sufficient length of time to form sulphate of lime and monophosphate of ammonia, which latter is leached out and evaporated to dryness. The evolution of free ammonia is avoided by replacing a proper amount of the sulphate of ammonia with sulphuric acid.

229,518—July 6, 1880. C. A. CATLIN. *Acid phosphate for baking-powders.*

An acid phosphate in which the active ingredient has an excess of base over a dihydrogen calcic phosphate, and in which both the phosphoric acid and the sulphate of lime are completely hydrated: produced by treating bone-ash or other tricalcic phosphate with oil of vitriol diluted with an excess of water under agitation and heat.

229,573—July 6, 1880. G. F. WILSON AND C. A. CATLIN. *Preparation of potassium phosphate for baking-powder.*

An acid powder containing as the active ingredient an acid potassium phosphate with an excess of base over a dihydrogen potassic phosphate, and having both the acid phosphate and the sulphate of lime completely hydrated; produced by treating tricalcic phosphate with dilute oil of vitriol under agitation and heat, decomposing the hydrogen dicalcic phosphate into hydrogen dipotassic phosphate with potassium sulphate, and converting the mass into a dry powder.

229,574—July 6, 1880. G. F. WILSON AND C. A. CATLIN. *Preparation of sodium phosphate for baking-powder.*

An acid powder in which the active ingredient is an acid sodium phosphate having an excess of base over a dihydrogen sodic phosphate, and with the acid phosphate and sulphate of lime completely hydrated: produced by decomposing tricalcic phosphate with dilute oil of vitriol, and then effecting a double decomposition with sodium sulphate under agitation and heat, and converting the mass into a dry powder.

301,406; 301,407—July 1, 1884. S. G. THOMAS. *Manufacture of alkaline phosphates.*

See Group VIII, Fertilizers.

313,369—March 3, 1885. C. V. PETRAEUS. *Solution of acid phosphates.*

A combination of free phosphoric acid with phosphate of soda, consisting of dihydrogen, sodic phosphate, phosphoric acid, and water, is produced by leaching a mixture of bone ash, 100 parts, with sulphuric acid of 49° Baumé, 100 parts, diluted to 20° or 25° Baumé; and adding to the solution 161 parts of Glauber's salts for each 28 parts of lime therein.

322,698—July 21, 1885. F. DIBBEN. *Manufacture of superphosphates.*

One part of acid soda sulphate is dissolved in 4 parts of water at a temperature of 130° F., allowed to stand until the neutral sulphate is crystallized out of the mother liquor, when 3¼ pounds of the mother liquor is added to 1 pound of phosphate of lime, and heated until the surplus water is evaporated.

324,471—August 18, 1885. L. IMPERATORI. *Extraction of phosphate soda from slags.*

Slags from phosphatic materials, as from the Thomas Gilchrist process, are smelted with sulphate of potash or soda and carbon, and subsequently treated with carbonic acid.

374,201—December 6, 1887. C. V. PETRAEUS. *Process of making acid potassium phosphates.*

Impure acid phosphate of lime, produced by decomposing bone or similar phosphate with a suitable acid and leaching, is decomposed by sulphate of potash; then carbonate of potash or caustic potash is added in excess, that is, in sufficient quantity to form in the solution an acid phosphate of potash containing an excess of potash over that in the dihydrogen potassium phosphate; and, after filtration, the solution is evaporated to crystallization.

389,566—September 18, 1888. C. GLASER. *Process of making acid phosphate.*

Insoluble phosphoric acid contained in mineral and petrified phosphates is converted into available phosphoric acid by finely pulverizing the mineral and then applying phosphoric acid directly thereto. The ground mineral may be divided into 2 parts, and the phosphoric acid extracted from 1 portion, by any method, and applied to the other portion.

412,792—October 15, 1889. J. REESE. *Crystalline calcic tetraphosphate and the process of making the same.*

Crystallized tetrabasic phosphate of lime; produced by oxidizing phosphorus at a high temperature while in the presence of lime, until the lime is charged with phosphoric acid, and then withdrawing the charged lime and subjecting it to slow cooling. It is pulverized and used as a fertilizer.

412,793—October 15, 1889. J. REESE. *Process of making phosphates.*

In the manufacture of calcium phosphate from phosphoritic iron, the molten phosphoritic iron is blown with an air blast, in a basic-lined vessel and in the presence of lime additions, until the phosphorus has been reduced to not less than one-half of 1 per cent (but little iron being oxidized when the phosphorus is in excess thereof), when the phosphate so formed is withdrawn. After lime is charged to the desired amount of phosphorus it is withdrawn and a charge of fresh lime added, whereby phosphates having any desired percentage of phosphoric acid may be produced.

417,820—December 24, 1889. C. GLASER. *Process of making acid phosphate.*

Mineral and petrified phosphates are ground and exposed to the action of dilute phosphoric acid, and the moisture subsequently evaporated; the amount of acid used is theoretically insufficient to convert all of the tricalcic phosphate (or corresponding compounds) into monocalcic phosphate, but exceeds the theoretical amount necessary to convert the same into bicalcic phosphate, thus forming a mixture of monocalcic and bicalcic phosphates, or equivalents. (See No. 389,566.)

418,259—December 31, 1889. C. E. D. WINSSINGER. *Process of making bicalcic phosphate.*

In the production of bicalcic phosphates, a mother liquor of monocalcic phosphate of lime is produced by forming a phosphoric-acid solution—by treating suitable phosphatic material with an excess of sulphuric acid—filtering, and treating the solution with carbonate of lime, or milk of lime, to convert it into a monocalcic-phosphate solution free from iron, etc. The solid residue from the filtration may be treated with a phosphoric-acid solution and sulphate of lime obtained as a by-product. The monocalcic solution is converted into a monosodic solution by treatment with sulphate of soda, which is then treated with carbonate of soda, and the resulting neutral solution is treated with lime; the phosphate of lime separated from the resulting caustic-soda solution (a by-product), and the separated phosphate treated with an aqueous monocalcic solution, and the bicalcic phosphate separated.

445,567—February 3, 1891. A. MEMMINGER. *Process of making acid phosphates.*

The drying of a compound of phosphatic material and acid is accelerated by adding thereto a fluoride compound, as calcium fluoride, and the drying period is graduated by comminuting to a definite degree and adding a greater or less proportion of the fluoride compound, or by varying the degree of comminution.

446,815—February 17, 1891. C. GLASER. *Process of making alkaline phosphates.*

Pure phosphates of the alkalis are obtained from crude commercial phosphoric acid by decomposing the salt of an alkali and an acid volatile at higher temperature (as nitrate of soda) by fusing same with crude commercial phosphoric acid in excess of the amount required to form a pyrophosphate; then dissolving the fused mass in water and boiling until conversion of meta and pyro phosphoric acid is effected; then treating with the carbonate of an alkali (or free alkali) till alkaline reaction is obtained; and finally separating the solution from insoluble impurities and crystallizing.

493,889—March 21, 1893. S. L. GOODALE. *Method of treating hydrated phosphates of alumina.*

Insoluble hydrated phosphates of alumina and iron are heated by indirect heat in suitable receptacles until all the water of constitution is expelled, or usually until the entire mass has a temperature of about 325° C., when the heat is arrested and the mass cooled before unfavorable molecular rearrangement is developed.

502,424—August 1, 1893. H. PRECHT. *Process of obtaining meta or pyro phosphoric-acid combinations.*

To produce a soluble potassium phosphate the insoluble potassium metaphosphate is melted and rapidly cooled to prevent crystallization. A basic body, as potash or soda, is added either before or during the melting, so that phosphoric acid in the form of pyrophosphate will in part be present in the molten salt.

572,512—December 8, 1896. H. ALBERT. *Process of manufacturing phosphates of alkalis.*

See Group X, Electro-chemistry.

598,182—February 1, 1898. H. POOLE. *Process of making phosphates.*

Pulverized native aluminum phosphate is mixed with a boiling solution of caustic soda to decompose the native phosphate, then filtered; then silica is added to the boiling solution while open to the atmosphere, whereby the alumina is precipitated as a silicate; the tribasic-sodium phosphate crystallized out; and finally the aluminum silicate treated with sulphuric acid, whereby aluminum sulphate is formed.

601,089—March 22, 1898. J. G. WIBORG. *Phosphate and method of making same.*

A tetra-calcium-sodium (or potassium) phosphate. See Group VIII, Fertilizers, Products.

627,267—June 20, 1899. C. LUCKOW. *Process of producing basic phosphates of copper by means of electrolysis.*

See Group X, Electro-chemistry.

CARBONATES.

200,134—February 12, 1878. C. FAHLBERG. *Improvement in processes for utilizing zinc sulphate.*

See Group XIX, Sulphites and Sulphates.

235,231—December 7, 1880. F. GUTZKOW. *Manufacture of carbonate of magnesia.*

It is obtained in a light and flocculent form by forcing carbonic-acid gas through the pulp of magnesium hydrate in a heated state.

278,283—May 22, 1883. D. SIDERSKY AND H. PROBST. *Process of obtaining carbonate of strontium.*

To recover the strontium salts from the residues of the treatment of saccharine solutions with strontium, the strontianite is dissolved in said residues with an excess of hydrochloric acid, the strontium solution filtered off, the strontium in the solution converted into a sulphate, and the latter finally reconverted into a carbonate.

280,172—June 26, 1883. H. GROUVEN. *Manufacture of strontium carbonate.*

Powdered celestine, or strontium sulphate, is mixed with a double sulphate of potassium and magnesium, and powdered carbon or coal, and the mixture furnaced in crucibles with exclusion of air. The mass is then lixiviated with exclusion of air, and the solution evaporated with introduction of carbonic-acid gas until the development of hydrogen sulphide stops. The precipitated strontium carbonate is separated from the potassium carbonate left in the solution.

301,383—July 1, 1884. E. A. MEBUS AND J. W. DE CASTRO. *Manufacture of carbonate of strontium.*

Sulphate of strontium is finely ground, mixed with water, and treated with carbonate of ammonia, or ammonia and carbonic-acid gas—water may be used—producing carbonate of strontium and sulphate of ammonia. Ammonia is recovered by distillation of the sulphate of ammonia with lime.

303,962—August 19, 1884. A. WÜNSCHE. *Method of obtaining carbonate of magnesia.*

Ammonia and carbonic acid are introduced into a solution of soluble magnesic salts, whereby ammonium-magnesium carbonate is formed, which is separated from the lye and heated to drive off the ammonia and a part or all of the carbonic acid. Caustic magnesia may be added to the compound salt of ammonia and magnesia to drive off the ammonia separately.

510,979—December 19, 1893. G. LUNGE AND C. H. M. LYTE. *Process of making basic lead salts and caustic alkali.*

Basic lead carbonate is formed and caustic soda.
See Group II, Sodas, Caustic Soda.

534,177—February 12, 1895. E. RUEFF. *Process of making light basic magnesium carbonate.*

Carbonic-acid gas is introduced with agitation into a mixture of magnesia, 1 part, and water, 25 parts, until about 1 part by weight of gas has been absorbed, when the mixture is boiled down.

534,212—February 12, 1895. H. ENDEMANN. *Process of making light magnesium carbonate.*

A mixture of magnesia, 20 parts; carbonate of ammonia, 30 parts; and water, 500 parts, is agitated and allowed to harden into a cake. The ammonia may be expelled by exposing to a temperature of 60° C. in a partial vacuum, or the cake can be broken up and washed.

534,213—February 12, 1895. H. ENDEMANN. *Process of making light carbonate of magnesia.*

A mixture of magnesia, 10 parts, and the bichromate of a fixed alkali, as of soda, 32 parts, in 250 parts of water, is subjected to agitation under a gradually-rising temperature to about 65° C., the light carbonate of magnesia then being collected.

601,007—March 22, 1898. H. E. STURCKE. *Amorphous carbonate of lime and method of and apparatus for obtaining same.*

A new product: dry powdered carbonate of lime, in extremely fine particles having a specific weight of from 78 to 94 grams per 100 c. c. when dried at not exceeding 100° C., is produced from the residues of the manufacture of caustic alkali by removing the caustic lime, mixing the residue with water, mechanically separating the impurities, then subjecting the carbonate and water to the action of a vacuum filter and drying.

603,225—April 26, 1898. H. E. STURCKE. *Process of preparing amorphous carbonate of lime from residues.*

Amorphous calcium carbonate is produced from residues by first removing the insoluble impurities from calcium oxide and alkali carbonate by mechanical separation, then causing the oxide and carbonate to react upon each other in water, and separating the calcium carbonate formed from the alkali hydrate and from all soluble impurities including calcium hydrate. The calcium carbonate is then mixed with water, passed through a mechanical separator, filtered, and dried.

603,226—April 26, 1898. H. E. STURCKE. *Process of preparing amorphous carbonate of lime from residues.*

Calcium carbonate, when made from residues according to No. 603,225 and separated from insoluble impurities, is dried, ground, and bolted.

SILICATES.

28,540—May 29, 1860. G. E. VAN DERBOURGH. *Reissue April 1, 1862. No. 1297. Reissue May 17, 1864; 1,674, (A). Improved mode of reducing silicates to a liquid or gelatinous state. 1,675 (B). Improvement in apparatus for treating silicious substances.*

Superheated steam is employed in a digester to reduce silicious and other refractory substances to a liquid or gelatinous state.

39,135—July 7, 1863. T. ELKINTON. *Improvement in the manufacture of alkaline silicates.*

The ingredients are fed through roof openings onto the sloping bed of a furnace, down which the fused silicate flows in a continuous stream to an outlet, subject to the direct heat of the furnace.

304,044—August 26, 1884. S. G. THOMAS. *Manufacture of alkaline salts.*

Alkaline chlorides are decomposed, and alkaline silicates and other nonhaloid alkaline salts and hydrates produced, together with chlorine and hydrochloric acid, by acting on sodium chloride in a Bessemer converter or Siemens or puddling furnace by the silicon contained in molten pig iron in presence of oxygen, oxide of iron, or any oxygen-yielding body. The chlorides are submitted to treatment inclosed in iron cases or compressed into shapes with or without oxide of iron to render the reaction more effective and prevent volatilization.

360,840—April 12, 1887. J. T. ADAMS. *Batch for making glass.*

A substance containing volatile hydrocarbon, as coal or sawdust, is mixed with a glass batch to clarify the bath.

376,409—January 10, 1888. A. KAYSER. *Process of making alkaline silicates and carbonates.*

The oxide of sodium or potassium is obtained from the chloride by mixing the chloride with clay, heating the mixture in a converter directly by passing highly-heated gases containing steam through the converter, smelting the converted material together with an alkali, and then extracting the sodium or potassium combinations by lixiviation.

376,410—January 10, 1888. A. KAYSER. *Process of making alkaline silicates.*

Silicate of sodium or potassium is made from the chloride thereof by mixing the chloride with silica, molding into bricks, and heating in a converter with highly-heated gases containing steam passed through the converter.

445,091—January 20, 1891. P. SIEVERT. *Process of dissolving water-glass.*

A clear solution of water glass is made by softening and partially dissolving the lumps by intimate contact with a jet of steam and treating them with a spray of alkaline lye, the solution being enriched by flowing over the glass lumps and continuously discharged as it forms.

448,772—March 24, 1891. M. W. BEYLIKGY. *Silicate compound.*

A new product, an alkaline-magnesian silicate solution, in which the silicate has the general formula, $7(Na_2O,5SiO_2)$, $2(Mg'' OSiO_2)$, insoluble after perfect drying, is produced by the action of a compound salt of fluosilicate of magnesium and hydrocarbonate of magnesia on a solution of tersilicate of soda.

590,143—September 14, 1897. W. GARROWAY. *Process of making alkaline silicates and nitric acid.*

Silica and an alkaline nitrate are heated with superheated steam passed through the retort or furnace.

633,841—September 26, 1899. F. HENKEL. *Process of making soluble alkaline silicates.*

Six parts of a solid alkaline silicate is mixed with 1 part of water and heated at from 100° to 120° C. until the water disappears and a homogeneous mass forms which is easily soluble in cold water. Or the solid alkaline silicate is mixed with a hot concentrated solution of the silicate. Sawdust, peat, or other substance may be added as a loosening agent when it is to be used as a fertilizer.

ALUMINATES.

454,137—June 16, 1891. A. KAYSER. *Process of making sodium aluminate.*

A mixture of insoluble sodium silico-aluminate—produced by process No. 376,409 (see Group II, Sodas, Sodium Carbonates)—and lime is subjected to a decomposing temperature and the product leached.

472,668—April 12, 1892. E. FLEISCHER. *Process of making aluminates of alkalies.*

In the manufacture of alkali aluminates from aluminous substances and alkaline sulphates, thiosulphates, or sulphides, the ingredients are mixed with iron and lime and heated in the presence of a reducing agent, the iron and lime being so proportioned that the sulphur present is taken up by the iron and the silicic acid by the lime, while the latter is in excess to prevent the formation of soluble combinations of sulphide of iron with the alkalis.

572,026—November 24, 1896. D. A. PÉNIAKOFF. *Process of making aluminate.*

A mixture of an alkaline sulphate and an alkaline sulphuret and a substance containing alumina is heated to incandescence, producing an alkaline aluminate. The gas mixed with heated air is passed into retorts filled with calcined alkaline chloride to produce chlorine and alkaline sulphate.

603,657—May 10, 1898. D. A. PÉNIAKOFF. *Process of making alkaline aluminates.*

Aluminates, free from sulphides of iron and the like, are produced by calcining a mixture of bauxite, alkaline sulphate, and carbon in the proportions indicated by the formula $2\ (4Al_2O_3.Fe_2O_3)+8Na_2SO_4+5C$, the proportions of the carbon being such that only one-fourth of the oxygen in the alkaline sulphate will be combined therewith.

612,364—October 11, 1898. F. RAYNAUD. *Process of making alkaline aluminates.*

Alkaline aluminates free from silicates are produced by passing steam through a heated mixture of aluminous ore and any sulphide, the base of which is capable of combining with alumina, sulphureted hydrogen being simultaneously produced. Preferably, briquets are formed of aluminous ore (alumina 640 parts); carbon, 207 parts; and an alkaline sulphate, as sulphate of soda, 900 parts; and dried for treatment.

618,772—January 31, 1899. H. S. BLACKMORE. *Process of making alkali aluminates.*

An alkali aluminate is produced by gradually introducing aluminium hydroxide, or aluminium hydrated oxide into a molten alkali salt. With sodium chloride, sodium aluminate and hydrochloric acid are produced.

MANGANATES AND PERMANGANATES.

326,657—September 22, 1885. T. KEMPF. *Process of manufacturing permanganates.*

Solutions of the manganic-acid salts are electrolyzed in the positive compartment of a cell having a porous diaphragm, producing permanganic-acid salts and free metallic hydroxides.

515,443—February 27, 1894. J. H. PARKINSON. *Porous permanganate block and process of making same.*

Permanganate of potash or soda is thoroughly mixed with kaolin—say from 10 to 12½ per cent—and formed with water into a stiff paste, which is baked hard and dry in a partial vacuum for use in the production of oxygen.

588,614—August 24, 1897. E. B. STUART. *Manganate and process of producing same.*

A double manganate of sodium and calcium, for use in extracting oxygen from air, is produced by subjecting sodium hydrate 80 parts, calcium oxide 56 parts, and binoxide of manganese 88 parts, with oxygen 128 parts, to a temperature of from 300° to 400° C. An excess of from 5 to 15 per cent of caustic soda is preferred.

631,228—August 15, 1899. R. H. REEVES. *Method of disinfecting.*

Sulphuric acid is mixed with a dry mixture of manganate of soda and carbon or wood dust to evolve gases for suppressing noxious vapors. After the gases are evolved water is added to form permanganic acid, which acts on sewage.

PROCESSES AND APPARATUS.

9,145—July 27, 1852. H. W. ADAMS. *Process for the manufacturing of metallic zinc in the form of a fine powder by the use of steam.*

Vaporized zinc is brought into contact with steam, the temperature of the steam being less than the melting point of the zinc, whereby the zinc vapor is instantly cooled and reduced to an impalpable metallic powder.

12,819—May 8, 1855. B. HARDINGE. *(Reissue; 344—January 22, 1856.) Improvement in apparatus for dissolving silica.*

The solvent is taken from the upper part of the charge in the digester, passed through a heater, and the vapor discharged into the bottom of the charge in connection with a stirrer.

45,684—December 27, 1864. E. SONSTADT. *Improvement in the manufacture and purification of magnesium.*

A solution of magnesium chloride and potassium chloride is evaporated to dryness and the residue heated to redness and acted upon by sodium, producing magnesium, which is distilled and purified, using an iron retort with exclusion of air.

54,266—April 24, 1866. C. H. WING. *Improved method of preparing magnesium for burning.*

Magnesium wire or ribbon is formed into a spiral coil.

77,987—May 19, 1868. C. KUEHN. *Improved mode of utilizing tin scrap or waste.*

The scrap is boiled in water and 25 per cent of muriatic acid and 2½ per cent of nitric acid (of weight of scrap metal) is added, and the tin dissolved. Successive charges are treated in the same bath with additions of acid until it is saturated with chloride of tin, which may be deposited on zinc plates, or the bath is evaporated and the chloride of tin is obtained.

96,524—Novmber 2, 1869. F. WILCOX. *Improved process of refining the waste from German silver and other metals.*

It is carbonized by pouring the molten waste into a crucible containing nitrate of soda, or other material supplying oxygen.

96,525—November 2, 1869. F. WILCOX. *Improved proccss of utilizing the waste formed in cleaning copper and brass goods.*

The waste is settled and the sediment dissolved with the aid of steam and the copper deposited out by means of iron plates. The liquor is then filtered, evaporated, and the sulphate of iron obtained. The deposited copper is washed, fused, and cast.

102,143—April 19, 1870. D. D. PARMELEE. *Improvement in treating tin scrap to obtain useful products.*

Tin is removed from tin scrap by treating the same in an inclosed vessel with chlorine gas, carrying off the fumes and condensing them as chloride of tin.

107,711—September 27, 1870. A. OTT. *Improvement in treating tin scrap for the manufacture of stannate of potash, etc.*

Fifty pounds of tin scrap is digested with 8 quarts of a lye of caustic soda 18° Baumé, 10 pounds of litharge, 1½ pounds of sodium nitrate, and 1½ pounds of sodium manganate along with steam. The liquor is decolorized by filtering through boneblack evaporated to 18° Baumé and cooled when stannate of soda chrystallizes. For stannate of potash in place of the soda compounds, 14 pounds of a lye of caustic potash, 2 pounds of potassium nitrate and 2 pounds of potassium manganate are used.

112,889—March 21, 1871. A. OTT. *Improvement in preparing tin salts from tinners' waste.*

Scrap tin is digested with muriatic acid and steam. The liquor is evaporated to 60° Baumé, and bichloride of tin formed by heating it with muriatic acid, sulphuric acid, and water. It is then distilled, bichloride of tin going over and chloride of iron remaining. The bichloride is reconverted into chloride by heating it with granulated tin.

119,267—September 26, 1871. F. W. DORN. *Improvement in processes of utilizing tinners' clippings.*

Scrap metal is treated with a mixture of muriatic acid gas, hyponitric-acid gas, and steam, or muriatic-acid gas and steam alone, followed by a jet of steam to wash off the muriate of tin.

121,948—December 19, 1871. C. LENNIG. *Improvement in removing tin from tin scrap.*

A solution of caustic soda or potash is poured over the scrap metal, drawn off, and then air forced through the mass of metal, and the operation successively repeated. Stannate of soda or potash is deposited out of the liquor.

128,265—June 25, 1872. T. F. WELLS. *Improvement in processes of separating tin from iron in tinners' clippings.*

Tin is separated from iron by means of hydrochloric acid to which nitric acid is gradually added in conjunction with chlorate of potash when the original bath gets exhausted. The tin is deposited out of the charged solution by zinc or otherwise, and the remaining liquor—a solution of the chloride of iron and zinc—is available for the preparation of paints, for a disinfectant, or for the preservation of wood.

129,417—July 16, 1872. D. McDANIEL, W. B. SPEAR, AND J. W. RICHARDS. *Improvement in methods of utilizing waste tin scrap and galvanized iron.*

Tin scrap is first treated with muriatic acid to dissolve the tin, and the iron metal being removed, galvanized-iron scrap is immersed in the bath. Then to the liquor is added waste sal-ammoniac skimmings, and a chemical equivalent of waste ammoniacal liquor from gas works, the iron precipitated, and the liquor cooled and crystallized, yielding a substitute for sal ammoniac as a flux for zinc coating baths.

146,286—January 6, 1874. H. SIEGER. *Improvement in recovering zinc from zinc fumes.*

The fumes of zinc and the gases evolved during the operation of treating alloys of zinc in a dry state are passed through a chamber containing carbonic oxide, and the zinc fumes condensed in a metallic state.

155,043—September 15, 1874. W. S. SAMPSON. *Improvement in methods of preserving lime.*

Lime is compressed into a solid mass, the barrel being held in an adjustable clamp. It preserves it from air slacking and reduces bulk.

160,018—February 23, 1875. J. HOLLIDAY AND H. M. BAKER. *Improvement in processes for removing tin from tin scrap.*

Tin scrap is heated in a bath of fused alkaline nitrate and then plunged into water.

190,550—May 8, 1877. C. A. CATLIN AND G. F. WILSON. *Improvement in processes of utilizing tin scrap.*

The scrap metal is sprinkled with dry chloride of sodium or potassium and nitrate of sodium or potassium, and then immersed in a caustic alkaline solution. Stannate crystals of the alkaline base are obtained from the evaporation of the saturated solution.

191,530—June 5, 1877. C. HORNBOSTEL. *Improvement in processes of applying oxygenated air in blast furnaces.*

Oxygen gas is supplied by forcing a current of air through a mixture of black oxide of manganese and sulphuric acid.

196,831—November 6, 1877. J. M. SANDERS. *Improvement in manufacture of oxide of tin.*

Scrap tinned iron is subjected to a heat that will volatilize the tin, which is oxidized by the admission of air, and the tin oxide settled in a condensing chamber.

200,587—February 19, 1878. P. C. VOGELLUS. *Improvement in separating tin from tin-scrap.*

Scrap metal is treated in a dilute nitric-acid bath, the iron being in contact with the positive pole of an electric battery, or otherwise rendered passive.

208,735—October 8, 1878. J. HOLLIDAY AND J. LAMBERT. *Improvement in utilizing tin scrap and manufacture of stannates.*

Tin scrap is treated in a bath composed of a solution of caustic soda or potash and an alkaline arsenite, nitrate or nitrite. The saturated solution of stannate of soda or potash is evaporated.

251,588—December 27, 1881. C. C. HUGHES. *Preparation of whitewash from lime.*

A whitewash free from grit is made by mixing lime with water and then grinding it. The product may be evaporated to a paste and packed in cans or barrels.

265,974—October 17, 1882. F. B. NICHOLS. *Apparatus for evaporating or concentrating liquids and saturating liquids with gases.*

Siphon slips, operating by surface attraction, are used to feed fluids out of troughs.

268,701—December 5, 1882. J. A. MATHIEU. *Process of and apparatus for evaporating liquids.*

Solid matter is separated from a heated solution thereof by showering it into a vacuum.

277,884—May 22, 1883. J. CLARK. *Method of reducing metals from their ores.*

Refractory ores or material compressed into a bar or block, is exposed to concentrated solar heat at the focus of a lens or reflector and suitable reagents applied.

277,885—May 22, 1883. J. CLARK. *Method of reducing metals from their ores.*

Ores are melted or disintegrated by concentrated solar heat and simultaneously carbonaceous reagents are applied, whereby ores containing chlorides may be reduced without the use of sodium or potassium.

298,149—May 6, 1884. C. R. A. WRIGHT. *Process of dissolving metals in ammoniacal solutions.*

Cuprammonium hydrate, or "copperized ammonia," or an analogous ammoniacal solution containing zinc, is produced by passing air through a solution of ammonia in water having fragments of the metal immersed therein.

322,157—July 14, 1885. C. A. CATLIN. *Process of recovering tin from tin-scrap.*

The tin is dissolved in an alkaline bath, and an oxide or salt, such as oxide of lime, is added, which will precipitate the tin as an insoluble stannate.

334,207—January 12, 1886. J. P. WETHERILL. *Apparatus for filtering and separating metals.*

A furnace for process No. 334,208. It has a chamber filled with refractory filtering material on which the metal to be filtered is placed, and one or more settling chambers with loosely built fire-brick division walls.

334,208—January 12, 1886. J. P. WETHERILL. *Process of filtering and separating metals.*

Metals and alloys of metals are heated to a temperature intermediate between the fusing points of the metals, and the metal having the lower fusing point is fused and passed through filtering material at the intermediate temperature.

344,575—June 29, 1886. W. HASENBACH. *Process of separating the tin from scrap or pieces of tin-plate or tinned iron by means of hydrochloric acid.*

The scrap metal is heated and treated with gaseous hydrochloric acid. The protochloride of tin formed distills off and is caught in a condensing chamber.

363,136—May 17, 1887. W. HASENBACH. *Recovery of tin from scraps of tinned plate.*

Protoxide of tin is obtained from lyes containing protochloride of tin and iron, obtained in the recovery of tin from tin-scrap by hydrochloric acid, by treating the lyes in closed vessels with pulverized carbonate of lime in excess, then separating the formed insoluble oxyprotochloride of tin from the dissolved oxyprotochloride of iron, and afterwards treating the oxyprotochloride of tin with carbonate of lime at a high temperature in a closed vessel, whereby the oxyprotochloride of tin is converted into a protoxide of tin.

363,173—May 17, 1887. G. SCHENCK. *Process of and apparatus for charging liquids with gases.*

For charging liquids with gases, as in the manufacture of bisulphites, the gases are forced into the liquor in a tank through tubes revolving therein beneath the surface of the liquor, and simultaneously the liquor, drawn from an upper to a lower tank, is discharged in spray through the gases in the top of the lower tank.

366,118—July 5, 1887. A. LAMBOTTE. *Process of recovering tin from tin-plate and other materials.*

The scrap metal is subjected to a continuous current of chlorine gas diluted with air at a temperature above the boiling point of stannic chloride, and the vapors are conducted into a stannic chloride solution. The concentrated solution is evaporated down with a current of warm air.

370,220—September 20, 1887. O. M. THOWLESS. *Process of extracting aluminium.*

Aluminium chloride is mixed with sodium-producing substances, as a mixture of aluminium chloride, 10 parts; chalk, 3 parts; coal, 10 parts; and carbonate of soda or soda-ash, 10 parts; with or without 1 part of cryolite as a flux, and heated in a vessel; then ground and washed to remove the carbon and other matter.

375,606—December 27, 1887. G. G. CONVERS. *Process of treating sal-ammoniac or flux skimmings.*

The raw skimmings of a galvanizing bath are subjected to the action of steam, which is injected into the mass, and simultaneously the condensed vapor containing the soluble chlorides of zinc is drained off. The drained skimmings are then calcined and reduced.

389,618—September 18, 1888. E. WALSH, JR. *Art of condensing metallic zinc from the vapors or fumes arising in the process of zinc-smelting.*

The zinc vapors and associated vapors from the smelting furnace are permitted to expand and separate by gravity in a condenser, the temperature of which is maintained at a point above the melting point and below the vaporizing point of zinc, whereby the fixed gases absorb heat from and liquefy the zinc vapors.

405,368—June 18, 1889. E. MENNEL. *Process of making double salts of mercury.*

A uni or multi valent phenol is treated with an acidulated solution of a persalt of mercury.

407,818—July 30, 1889. C. A. CATLIN. *Process of charging liquids with gas.*

A current of mixed gas is continuously passed through a series of tanks in one direction, while the liquid is intermittingly passed through the tanks in the opposite direction, with agitation of the liquid and gas.

409,409—August 20, 1889. C. LANGER. *Apparatus for treating solids with gases.*

It has a plurality of parallel intersecting spirals or Archimedian screws, having intersecting circles of rotation.

410,067—August 27, 1889. H. BOWER. *Process of facilitating chemical reactions.*

Two or more substances to be combined are subjected to the effect of impact and attrition from opposing jets. A finely divided solid may be used to intensify the impact and attrition.

412,247—October 8, 1889. W. W. FRANTZ. *Process of preserving lime.*

Quicklime, hot from the kiln, is pulverized and hermetically sealed in boxes in a hot state.

412,780—October 15, 1889. J. McNAB. *Process of filtering.*

A soluble salt is leached from a mixed mass of soluble and insoluble material, by grinding the mass with water into a thick homogeneous paste, adding sufficient water to dissolve the soluble portions, and forming a thoroughly-fluid homogeneous mixture in an agitating tank, and then forcing the mixture into the fibrous bags of a filter press by means of a force pump.

421,935—February 25, 1890. J. HOLLIDAY. *Process of making alkaline salts of antimony.*

Alkaline antimonites, or antimoso-antimonates, are made by treating pulverized metallic antimony in a hot aqueous solution of an alkaline nitrate or nitrite and caustic alkali.

430,653—June 24, 1890. G. KASSNER. *Process of producing plumbates of alkaline earths.*

Plumbates of alkaline earths are produced by roasting in free air a mixture of lead oxide (or a mixture of such salts of lead as are reduced to oxides by heat) and the carbonate or hydrate or caustic compound of an alkaline earth.

435,280—August 26, 1890. E. CAREZ. *Process of making ammonium nitrate.*

Barium sulphate is calcined out of contact with air, with a mixture of charcoal and a hydrocarbon, as resin-oil, and the product boiled with sulphur and water to produce polysulphide, which is transformed into barium nitrate by means of sodium nitrate, then crystallized and decomposed with ammonium sulphate to produce ammonium nitrate on the one hand and to recover the barium sulphate.

450,243—April 14, 1891. C. LIESENBERG. *Process of clarifying liquids.*

A clarifying liquid for solutions is prepared by treating a phosphate in the presence of water with sulphurous acid.

459,034—September 8, 1891. J. M. G. BONNET. *Process of recovering tin from waste tin-plate.*

Stannates are formed by agitating the plated scrap in an alkaline solution and simultaneously forcing hot air into the solution. The solution is then drawn off and sulphurous acid introduced, precipitating the tin as stannic acid.

485,035—October 25, 1892. H. C. W. HARMSEN. *Process of separating tin from tin-plate waste.*

The tin is dissolved in a bath of dilute sulphuric acid and nitric acid, and the saturated tin sulphate solution is then mixed with heated dilute nitric acid, and temperature maintained at not less than 90° C., whereby the dissolved tin is precipitated as stannic acid.

489,624—January 10, 1893. C. L. C. BERTOU. *Process of precipitating oxide of tin from solutions.*

Carbonate of lime is gradually added to the solution with the latter at a temperature near but below ebullition and exposed to the air until the precipitation of tin is complete. It is then cooled, the precipitate collected and washed with cold water and suspended in solution of a carbonate of an alkali metal, the strength of which is gradually increased until it presents a slightly alkaline reaction.

491,254—February 7, 1893. T. TWYNAM. *Process of separating tin from iron or steel.*

The metal is first coated with a film which will form a scale when heated, as by dipping in a slightly glutinous solution of calcium chloride; it is then heated until the tin is oxidized and plunged into a water bath, the film of oxide falling off. The oxides may then be treated to separate the iron and tin oxides.

497,256—May 9, 1893. M. WANNER. *Process of reducing sulphide ores and manufacturing carbon bisulphide.*

Sulphide ore, cleaned from gangue and pulverized, is mixed with carbon or hydro-carbon and subjected to destructive distillation; the carbon-bisulphide vapor is collected and condensed and the reduced metal obtained.

519,391—May 8, 1894. J. REESE. *Method of utilizing iron ore.*

The entire contents of phosphoretic iron ores are utilized by magnetically separating therefrom the larger portion of the magnetic oxide, finely pulverizing the tailings and treating with sulphuric acid to make the phosphates soluble and available for plant food.

521,444—June 12, 1894. E. A. UEHLING. *Process of and apparatus for analyzing gases.*

The percentage of a constituent of a gas—say of the waste gas of blast furnaces—is continuously indicated by means of continuous suction through minute inlet and outlet apertures and the abstraction of the constituent from the gas in its passage between said minute apertures, whereby the tension of the gas is varied and is employed as an index of the percentage of said constituent.

522,746—July 10, 1894. E. A. UEHLING AND A. STEINBART. *Process of and apparatus for analyzing gases.*

As an improvement on the process of No. 521,444, the gas is filtered and passed through a number of absorption chambers, each having a minute inlet and outlet chamber, and each abstracting from the gas a constituent, the percentages of which are severally determined by the changes from the normal tensions.

537,941—April 23, 1895. H. F. D. SCHWAHN. *Method of roasting ores and recovering vapors therefrom.*

The ores or minerals ground and mixed with nitrate of sodium or potassium—10 per cent—are roasted and sublimated, steam being injected into the chamber, and the resultant vapors are forced through one or more baths of solutions of nitric acid, hydrochloric acid, a salt of an alkali metal—preferably sodium chloride—in water of about 10° Baumé, causing reactions with the production of chlorides and carbonates of the metallic vapors and sulphates of the alkalis, which are further treated as seems advisable or profitable.

538,785—May 7, 1895. E. E. LUNGWITZ. *Process of smelting ores.*

Ores, containing a volatilizable metallic element, are smelted in a furnace under a maintained pressure higher than the pressure at which the resulting metal or regulus, or one of its constituents, would boil at the temperature obtained in the furnace.

549,596—November 12, 1895. A. ERLENBACH. *Method of utilizing tin of stanniferous materials.*

Stanniferous materials, as tin scrap, stanniferous waste of dyeing and finishing factories, etc., are heated with muriatic acid to turn the tin into solutions of perchloride of tin; the solution is concentrated, and the heating continued to distill off the perchloride of tin, and simultaneously therewith a stream of muriatic acid is introduced into the perchloride of tin.

556,568—March 17, 1896. E. WARZÉE. *Process of precipitating iron from solutions containing iron and zinc.*

Iron is precipitated as ferroso ferric oxide from solutions containing iron and zinc—as the spent electrolytes of galvanic batteries—by adding zinc in excess and blowing in air at a temperature of 90° C. to produce oxidation and agitation.

558,818—April 21, 1896. T. K. KLIMMER. *Process of making alkaline salts of metallic acids.*

For the production of alkaline salts with oxyacids of heavy metals from ores containing the heavy metals combined with oxygen, the ore—such as chrome ore—is mixed with ferric oxide and an excess of alkaline carbonate, calcined in the presence of air, and lixiviated. The residue, dried and ground, is used in a subsequent operation.

582,473—May 11, 1897. J. B. HILLIARD. *Chemical apparatus.*

To prevent gases from intermingling while passing through liquids, inclined, inverted, open channels are used for the gas, with entrance pipes connected with the lower ends of the channels and escape pipes connected with the upper ends.

593,415—November 9, 1897. S. GANELIN. *Method of treating sulfid ores as lead-zinc ores.*

Lead sulphide ores are introduced into a bath of a fused halogen salt capable of being decomposed by the sulphide—as chloride of zinc—effecting a double decomposition and the conversion of the lead sulphide into a halogen salt of lead, and of the base of the halogen salt of the bath into a sulphide.

600,347—March 8, 1898. T. HUNTINGTON AND F. HEBERLEIN. *Process of treating sulfid ores of lead, etc., preparatory to smelting.*

Sulphide ores of lead are oxidized by mixing the ore with an oxide of an alkaline earth metal—as calcium oxide—heating the mixture in the presence of air to a bright red heat (700° C.), then cooling to a dull red heat (500° C.), and finally forcing air through the mass until the lead ore, reduced to an oxide, fuses.

602,632—April 19, 1898. G. DE CHALMOT. *Method of obtaining free amorphous silicon.*

Silicon in the presence of copper is reclaimed in a free condition by heating finely pulverized silicon-copper alloy mixed with sulphur in a closed vessel to a temperature between 250° and 300° C. The silicon is set free as an amorphous powder. The amount of sulphur is regulated to form Cu_2S or CuS.

605,379—June 7, 1898. H. S. BLACKMORE. *Retort and method of making same.*

An impervious, noncorrodible retort for manufacture of carbon bisulphide is made of fire clay lined with a glaze of lead sulphide formed by coating it with fusible oxide of lead and then exposing to the action of carbon-bisulphide vapor when at a red heat.

607,497—July 19, 1898. G. M. WESTMAN. *Process of and apparatus for pyritic smelting.*

Hot air from regenerators is forced up through a column of pyritic ore free from carbonaceous fuel; the gases and volatilized products pass off, the oxides are condensed, and the remaining gases, nitrogen and sulphurous acid, produce sulphuric acid, while matte and slag are continuously drawn off from the base of the ore column.

616,821—December 27, 1898. J. BOCK. *Process of and apparatus for obtaining crystals.*

Large individual crystals are obtained from a heated saturated solution by passing it through a long, thin mass of crystals of the substance being crystalized, subjecting it to a gentle and slow disturbance and to a gradual cooling.

624,833—May 9, 1899. E. E. LUNGWITZ. *Process of roasting ores.*

The mass is opened by roasting under super-atmospheric pressure and suddenly removing the external pressure while the blast is shut off, whereby the expansion of the compressed gases within the mass break it open.

634,566—October 10, 1899. F. BALLOU. *Art of smelting ores.*

Water-saturated coke is used in the charge for a stack furnace, resulting in reduction of coke consumption due to the retarding of coke combustion until the charge has sunk to the smelting zone.

ORGANIC.

PROCESSES AND APPARATUS.

49,995—September 19, 1865. J. FRASER. *Improved method of treating oil wells for the removal of paraffine.*

Hot carbonic oxide is used for heating oil wells to redissolve the solid hydrocarbons.

80,835—August 11, 1868. F. RENZ. *Improved process of manufacturing sulphuric ether.*

The vapor from corn mash is passed through sulphuric acid at a temperature of 240° F., forming sulpho-vinic acid, which is washed at a temperature of 195° F. and then passed through sulphuric acid at a temperature of 275° to 300° F., producing sulphuric ether and water, which is then purified by means of an alkali and water baths, and the water condensed, leaving pure sulphuric ether.

136,623—March 11, 1873. W. F. SIMES. *Improvement in preparing camphor.*

Distilled or refined camphor is formed into blocks or tablets by pressure.

164,478—June 15, 1875. I. M. PHELPS. *Improvement in permanent flour of camphor.*

Pulverulent camphor is produced by subliming crude camphor in combination with glycerine. The glycerinated camphor is compressed into blocks.

169,727—November 9, 1875. C. PETERS. *Improvement in reagents for testing the strength of vinegar.*

A mixture of litmus, one-half pound; concentrated liquid ammonia, 1 pound; alcohol, 1 quart; and water enough to make in all 17 quarts, constitutes a blue testing liquid that is turned red by vinegar.

247,793—October 4, 1881. W. H. ATKINSON. *Refining camphor and apparatus therefor.*

Camphor is refined while surrounded by sheet metal or alloy, which can afterwards be stripped from the cake.

511,143—December 19, 1893. W. H. HIGGIN. *Process of making sodium acetate.*

Esparto liquor and other alkaline waste liquors containing sodium acetate are evaporated, the residue carefully heated at about 400° C., but below the heat at which sodium acetate is decomposed, and the charred mass leached.

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 211. WASHINGTON, D. C. June 25, 1902.

AGRICULTURE.

WEST VIRGINIA.

Hon. WILLIAM R. MERRIAM,

Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of West Virginia, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land, under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It also includes the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of West Virginia, June 1, 1900, numbered 92,874 and were valued at $168,295,670. Of this amount, $34,026,560, or 20.2 per cent, represents the value of buildings, and $134,269,110, or 79.8 per cent, the value of the land and improvements other than buildings. On the same date the value of farm implements and machinery was $5,040,420, and of live stock, $30,571,259. These values, added to that of farms, give $203,907,349, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $44,768,979, of which amount $19,072,790, or 42.6 per cent, represents the value of animal products, and $25,696,189, or 57.4 per cent, the value of crops, including forest products cut or produced on farms. The total value of farm products for 1899 is more than twice that for 1889, but a part of this increase is probably due to a more detailed enumeration in 1900 than in 1890.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $8,160,860, leaving $36,608,119 as the gross farm income. The ratio which this latter amount bears to the "total value of farm property" is referred to as the "percentage of gross income upon investment." For West Virginia, in 1899, it was 18.0 per cent. As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for West Virginia.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.

AGRICULTURE IN WEST VIRGINIA.

GENERAL STATISTICS.

West Virginia has a total land area of 24,645 square miles, or 15,772,800 acres, of which 10,654,513 acres, or 67.5 per cent, are included in farms.

From the northeast corner of the state extending south and southwest to the Big Sandy River is a belt of mountains, interspersed with narrow valleys. Clay soil is found in limited areas in the higher portions of this region, while the "stream and upland alluviums" are found on the gentler slopes and in the valleys. The sandy soil which prevails in the extreme northeastern part is the least productive of the soils of this belt.

West of the mountains is a large area of broad flat hills better fitted for grazing than for cultivation, but among the hills are many streams that enrich a naturally fertile soil. Cattle and sheep thrive on the hillsides and are shipped in large quantities to the Baltimore and Pittsburg markets.

The remainder of the state has a gently rolling surface extending to the Ohio River. The soil is rich, consisting of clay and sand loams, mingled with humus and vegetable matter and enriched by disintegrated limestone.

NUMBER AND SIZE OF FARMS.

Table 1 shows, by decades since 1870, the number of farms, the total and average acreage, and the per cent of farm land improved.

TABLE 1.—FARMS AND FARM ACREAGE: 1870 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	92,874	10,654,513	5,498,981	5,155,532	114.7	51.6
1890	72,773	10,321,326	4,554,000	5,767,326	141.8	44.1
1880	62,674	10,193,779	3,792,327	6,401,452	162.6	37.2
1870	39,778	8,528,394	2,580,254	5,948,140	214.4	30.2

The total number of farms in West Virginia in 1900 was 53,096 greater than in 1870, and 20,101, or 27.6 per cent, greater than in 1890. The increase in the total farm acreage has not been so rapid, amounting to but 24.9 per cent since 1870 and 3.2 per cent in the last decade. These changes have involved a constant decrease in the average size of farms and an increase in the per cent of farm land improved.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year since 1870.

TABLE 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF PRODUCTS: 1870 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$203,907,349	$168,295,670	$5,040,420	$30,571,259	$44,768,979
1890	178,961,330	151,880,300	3,116,420	23,964,610	20,439,000
1880	153,588,725	133,147,175	2,699,163	17,742,387	19,360,049
1870[2]	120,892,738	101,604,381	2,112,937	17,175,420	[3]23,379,692

[1] For year preceding that designated.
[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished one-fifth.
[3] Includes betterments and additions to live stock.

The gain in the last decade in the total value of farm property was $24,946,019, or 13.9 per cent. In the same time, land, improvements, and buildings increased in value $16,415,370, or 10.8 per cent; implements and machinery, $1,924,000, or 61.7 per cent; and live stock, $6,606,649, or 27.6 per cent. The value of farm products of 1899 was 119.0 per cent greater than the value reported for 1889, but it is probable that a part of this gain is due to the more detailed enumeration made in 1900 than in 1890. One important item enumerated in 1900 but not in 1890 is the value of animals sold and animals slaughtered on farms, which for 1899 amounted to $9,428,066.

COUNTY STATISTICS.

Table 3 gives an exhibit of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.
The State	92,874	90,342	10,654,513	5,498,981	$134,269,110	$34,026,560	$5,040,420	$30,571,259	$36,608,119	$2,041,560	$405,270

All counties report increases in the number of farms in the last ten years, except Fayette and Logan, a territorial change having occurred in the latter county in that period. Nearly all counties report increases in their total farm area, and a still greater number report increases in the area of improved land. The average size of farms for the state is 114.7 acres, and varies from 72.2 acres in Clay county to 304.9 acres in Hardy county. The largest farms are, as a rule, in the counties given principally to the raising of cereals and live stock.

For the state, the average value of farms, exclusive of buildings, is $1,446.00. Approximately three-fourths of the counties report increases in the total value of farms since 1890, while McDowell alone reports a decrease in the value of implements and machinery. The value of live stock reported was less than in 1890 in five counties—Berkeley, Fayette, Hancock, Logan, and Taylor.

FARM TENURE.

Table 4 gives a comparative exhibit of farm tenure in 1880, 1890, and 1900. The farms operated by tenants are divided into two groups, designated as farms operated by "cash tenants," who pay a cash rental or a stated amount of labor or farm produce, and farms operated by "share tenants," who pay as rental a share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer. The farms under the classification "owners" in Table 4 are subdivided in Table 5 into groups designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other or others owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive a fixed salary from the owners for their supervision and other services.

Table 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.

1890	72,773	59,858	4,275	8,640	82.2	5.9	11.9
1880	62,674	50,673	4,292	7,709	80.9	6.8	12.3

[1] Including "part owners," "owners and tenants," and "managers."

Table 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

Part 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	92,874	65,797	4,620	1,112	1,054	7,526	12,765
White	92,132	65,320	4,566	1,109	1,046	7,458	12,633
Colored	742	477	54	3	8	68	132

Part 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	70.9	5.0	1.2	1.1	8.1	13.7
White	100.0	70.9	5.0	1.2	1.1	8.1	13.7
Colored	100.0	64.3	7.3	0.4	1.1	9.1	17.8

Since 1880 the total number of farms has increased 30,200, or 48.2 per cent. Since 1890 the number of farms operated by owners has increased 12,725, or 21.3 per cent; the number by cash tenants, 3,251, or 76.0 per cent; and that by share tenants, 4,125, or 47.7 per cent. The percentages in Table 4 show that the number of farms operated by cash tenants has increased at a relatively greater rate in the last decade than the numbers operated by owners and share tenants.

Of the farms in the state, 99.2 per cent are operated by white farmers, and 0.8 per cent by colored farmers. Of the white farmers, 77.1 per cent own all or part of the land they operate, and 22.9 per cent operate farms owned by others. For colored farmers, the corresponding percentages are 72.0 and 28.0, respectively.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

Table 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	92,874	114.7	10,654,513	100.0	$203,907,349	100.0
White farmers	92,132	115.2	10,612,929	99.6	203,079,638	99.6
Colored farmers	742	56.0	41,584	0.4	827,711	0.4
Owners	65,797	117.9	7,757,841	72.8	149,916,878	73.5
Part owners	4,620	126.5	584,416	5.5	11,236,200	5.5
Owners and tenants	1,112	168.3	187,145	1.7	3,453,271	1.7
Managers	1,054	340.6	358,994	3.4	6,337,702	3.1
Cash tenants	7,526	103.0	774,933	7.3	13,039,719	6.4
Share tenants	12,765	77.6	991,184	9.3	19,923,579	9.8

Table 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$1,446	$367	$54	$329	$394	18.0
White farmers	1,451	368	54	331	396	17.9
Colored farmers	746	181	30	159	225	20.1
Owners	1,470	394	59	355	415	18.2
Part owners	1,635	370	60	367	440	18.1
Owners and tenants	2,018	501	85	501	549	17.7
Managers	4,341	997	77	598	595	9.9
Cash tenants	1,246	232	34	221	292	16.9
Share tenants	1,080	237	36	208	299	19.2

Colored farmers operate but 0.8 per cent of the farms of West Virginia, representing 0.4 per cent of the total value of farm property, and 0.4 per cent of the total acreage. The average values of all forms of farm property are smaller for colored than for white farmers. The higher per cent of gross income for colored than for white farmers is due to the smaller average size, and lower values, of the farms of colored farmers. Farms operated by managers have the highest average values of all forms of farm property except for implements and machinery, but the ratio which the gross income bears to the total value of farm property is smaller than for any other group.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

Table 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	92,874	114.7	10,654,513	100.0	$203,907,349	100.0
Under 3 acres	599	1.9	1,164	(1)	412,490	0.2
3 to 9 acres	5,342	6.0	81,869	0.3	2,504,745	1.2
10 to 19 acres	7,140	13.6	96,831	0.9	4,035,133	2.0
20 to 49 acres	19,306	33.5	645,963	6.0	16,421,338	8.0
50 to 99 acres	25,529	69.1	1,765,028	16.6	36,873,876	18.1
100 to 174 acres	20,164	126.2	2,544,791	23.9	51,903,108	25.5
175 to 259 acres	7,542	208.8	1,574,416	14.8	31,137,456	15.3
260 to 499 acres	5,127	339.0	1,737,835	16.3	32,202,087	15.8
500 to 999 acres	1,511	646.7	977,235	9.2	15,607,300	7.6
1,000 acres and over	614	2,083.7	1,279,381	12.0	12,809,816	6.3

[1] Less than one-tenth of 1 per cent.

Table 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$1,446	$367	$54	$329	$394	18.0
Under 3 acres	233	359	21	76	170	24.7
3 to 9 acres	218	168	12	71	113	24.1
10 to 19 acres	295	155	18	97	157	27.7
20 to 49 acres	493	185	26	147	217	25.5
50 to 99 acres	895	267	42	240	314	21.8
100 to 174 acres	1,666	444	73	391	473	18.4
175 to 259 acres	2,779	654	104	592	678	16.4
260 to 499 acres	4,368	914	133	866	901	14.4
500 to 999 acres	7,563	1,156	150	1,460	1,296	12.5
1,000 acres and over	16,462	1,806	197	2,398	2,183	10.5

The group of farms containing from 50 to 99 acres includes the greatest number of farms, and the group of 100 to 174 acres comprises the greatest number of acres of farm land.

With a few exceptions, the average values of the several forms of farm property increase with the size of the farms. For the group of farms of less than 3 acres each, all values are comparatively high, as this class contains many florists' establishments, market gardens, poultry farms, and city dairies. The incomes from these industries are determined, not so much by the area of land used, as by the amount of capital invested and the amounts expended for labor and fertilizers.

The average gross incomes per acre for the various groups classified by area are as follows: Farms under 3 acres, $87.51; 3 to 9 acres, $18.92; 10 to 19 acres, $11.54; 20 to 49 acres, $6.48; 50 to 99 acres, $4.55; 100 to 174 acres, $3.75; 175 to 259 acres, $3.25; 260 to 499 acres, $2.66; 500 to 999 acres, $2.00; and 1,000 acres and over, $1.05. The average gross income decreases regularly as the farms increase in size.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop, and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm; if vegetables are the leading crop, constituting 40 per cent of the value of products, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive 40 per cent of their income from any one class of products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

Table 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	92,874	114.7	10,654,513	100.0	$203,907,349	100.0
Hay and grain	22,400	111.5	2,497,780	23.5	49,118,762	24.1
Vegetables	1,183	40.9	48,410	0.5	2,179,062	1.1
Fruits	1,381	108.5	149,841	1.4	3,052,706	1.5
Live stock	36,255	138.5	5,021,968	47.1	101,725,834	49.9
Dairy produce	1,828	94.5	172,769	1.6	5,871,460	2.9
Tobacco	365	82.6	30,147	0.3	355,876	0.2
Sugar	10	77.7	777	(1)	9,152	(1)
Flowers and plants	20	9.2	185	(1)	124,060	(1)
Nursery products	11	142.1	1,563	(1)	52,603	(1)
Miscellaneous	29,421	92.8	2,731,073	25.6	41,417,834	20.3

[1] Less than one-tenth of 1 per cent.

Table 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$1,446	$367	$54	$329	$394	18.0
Hay and grain	1,494	377	55	267	379	17.3
Vegetables	1,196	454	47	145	314	17.0
Fruits	1,485	435	47	244	487	22.0
Live stock	1,840	432	68	466	469	16.7
Dairy produce	2,013	682	82	435	584	18.2
Tobacco	574	181	29	191	416	42.6
Sugar	583	126	32	174	133	14.5
Flowers and plants	3,390	2,505	225	83	2,032	32.8
Nursery products	3,462	991	111	218	4,852	101.5
Miscellaneous	905	253	36	214	297	21.1

The average values per acre of products not fed to live stock are: For farms deriving their principal income from flowers and plants, $219.63; nursery products, $34.15; vegetables, $7.67; dairy produce, $6.18; tobacco, $5.03;

fruit, \$4.49; hay and grain, \$3.40; live stock, \$3.38; miscellaneous, \$3.21; and sugar, \$1.71.

The wide variations in the averages and percentages of gross income are due, largely, to the fact that in computing gross income no deductions are made for expense involved in operation. For florists' establishments and nurseries, the average expenditures for such items as labor and fertilizers represent a far greater percentage of the gross income than in the case of "live-stock" and "miscellaneous" farms. If it were possible to present the average net income, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.

TABLE 13.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	\$1,446	\$367	\$54	\$329	\$394	18.0
\$0	872	137	10	143		
\$1 to \$49	326	90	7	56	27	5.6
\$50 to \$99	385	123	12	81	70	11.7
\$100 to \$249	616	177	22	163	169	17.3
\$250 to \$499	1,159	310	49	305	345	18.9
\$500 to \$999	2,459	614	101	556	664	17.8
\$1,000 to \$2,499	5,515	1,278	191	1,036	1,399	17.5
\$2,500 and over	13,651	2,775	333	2,372	4,186	21.9

Of the total number of farms in West Virginia, 433 report no income. Some of these farms are summer homes, some are farms partially abandoned in 1899, while others had changed owners or tenants, and the persons in charge, June 1, 1900, were unable to give definite information concerning the products of the preceding year. To this extent the reports fall short of giving a complete exhibit of farm income in 1899.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the Twelfth Census. The age grouping for neat cattle was determined in accordance with their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with the figures published in previous census reports.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	134,107	\$1,102,228	\$8.22	2,397
Steers	1 and under 2	79,972	1,425,903	17.83	346
Steers	2 and under 3	71,088	1,930,457	27.16	173
Steers	3 and over	43,780	1,774,300	40.53	269
Bulls	1 and over	8,096	244,303	30.18	29
Heifers	1 and under 2	60,288	990,655	16.44	572
Cows kept for milk	2 and over	205,601	5,694,302	27.70	11,937
Cows and heifers not kept for milk.	2 and over	36,870	896,279	24.31	39
Colts	Under 1	11,947	264,857	22.17	149
Horses	1 and under 2	12,963	501,504	38.69	173
Horses	2 and over	160,278	9,610,189	59.96	17,775
Mule colts	Under 1	711	24,293	34.17	10
Mules	1 and under 2	852	41,149	48.30	59
Mules	2 and over	9,791	659,692	67.38	3,426
Asses and burros	All ages	116	15,234	131.33	58
Lambs	Under 1	396,104	867,571	2.19	751
Sheep (ewes)	1 and over	497,247	1,554,696	3.13	995
Sheep (rams and wethers).	1 and over	75,492	242,289	3.21	90
Swine	All ages	442,844	1,389,808	3.14	22,185
Goats	All ages	847	2,123	2.51	672
Fowls:[1]					
Chickens[2]		2,759,585	963,805		
Turkeys		105,265			
Geese		129,948			
Ducks		58,273			
Bees (swarms of)		111,417	375,622	3.37	
Value of all live stock.			30,571,259		

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including Guinea fowls.

The value of all live stock on farms, June 1, 1900, was \$30,571,259. Of this amount 33.9 per cent represents the value of horses; 27.4 per cent, that of neat cattle, other than dairy cows; 18.6 per cent, that of dairy cows; 8.7 per cent, that of sheep; 4.5 per cent, that of swine; 3.2 per cent, that of poultry; 2.4 per cent, that of mules; and 1.3 per cent, that of all other live stock.

No reports were secured of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, however, the value of live stock not on farms was \$1,777,189, and the total value of live stock in the state, exclusive of poultry and bees not on farms, was \$32,348,448. There were about one-ninth as many horses two years old, and over, employed in towns and cities as in agricultural operations.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the changes since 1870 in the numbers of the most important domestic animals.

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1870 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	205,601	434,181	185,188	11,470	572,739	442,884
1890	188,492	377,574	154,722	7,390	785,063	411,018
1880	156,956	301,488	126,143	6,226	674,769	510,613
1870	104,434	197,246	90,479	2,189	552,327	268,031

[1] Lambs not included.

Every class of domestic animals shows a considerable increase in numbers since 1870, that of dairy cows, other neat cattle, horses, and mules being greatest and of uninterrupted progress. The number of sheep increased each decade except from 1890 to 1900, for which period a decrease of 27.0 per cent is shown. The numbers of swine show regular increases, except for an unusually large report in 1880.

Compared with the census of 1890, the present census shows the following increases in the numbers of live stock: Dairy cows, 9.1 per cent; other neat cattle, 15.0 per cent; horses, 19.7 per cent; mules and asses, 55.2 per cent; and swine 7.8 per cent. The large increases in the numbers of mules and horses are due to the development of oil fields and mines which require additional work animals.

In comparing the poultry report of 1900 with that of 1890, it should be borne in mind that in 1900 the enumerators were instructed to report no fowls under three months old, while in 1890 no such limitation was made. This fact explains to a great extent the apparent decrease in numbers of fowls of all kinds. Compared with the figures for 1890, the present census shows decreases in the numbers of fowls as follows: Ducks, 56.5 per cent; turkeys, 51.0 per cent; geese, 26.5 per cent; and chickens, 13.7 per cent. The large increase in the number of eggs produced indicates conclusively that the decrease in the numbers of fowls is only apparent.

ANIMAL PRODUCTS.

Table 16 is a summarized statement of the animal products for 1899.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	3,123,455	$636,012
Mohair and goat hair	Pounds	140	43
Milk	Gallons	[1]83,861,660	[2]5,088,153
Butter	Pounds	16,913,129	
Cheese	Pounds	74,243	
Eggs	Dozens	17,242,400	1,877,675
Poultry			1,843,752
Honey	Pounds	1,673,120	199,089
Wax	Pounds	30,180	
Animals sold			6,533,034
Animals slaughtered			2,895,032
Total			19,072,790

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of milk sold and consumed, and of butter and cheese made.

The value of animal products for the state in 1889 was $19,072,790, of which 49.4 per cent represents the value of animals sold and animals slaughtered on farms; 26.7 per cent, that of dairy products; 19.5 per cent, that of poultry and eggs; 3.3 per cent, that of wool, mohair, and goat hair; and 1.1 per cent, the value of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms, $9,428,066, is 25.8 per cent of the gross farm income. Of all farms reporting live stock, 72,705, or 81.6 per cent, report animals slaughtered, the average value per farm being $39.82. Animals sold were reported by 53,294 farmers, or 59.8 per cent of all reporting live stock, the average receipts per farm for animals sold being $122.58. In obtaining these reports the enumerators were instructed to secure from each farm operator a statement of the amount received from sales in 1899 less the amount paid for animals purchased during the year.

DAIRY PRODUCE.

In 1899, 1,828 farmers, or 2.0 per cent of the total number in the state, derived their principal income from the sale of dairy products. There were 24,412,594 gallons more milk produced in that year than in 1889, a gain of 41.1 per cent. Cheese was produced on farms in about the same quantities for both years, but 20.3 per cent more butter was made on farms in 1899 than in 1889.

Of the $5,088,153 given in Table 16 as the value of dairy products, $3,688,346, or 72.5 per cent, represents the value of such products consumed on farms, and $1,399,807, or 27.5 per cent, the receipts from sales. Of the latter amount, $841,147 was received from the sale of 5,520,784 pounds of butter; $531,127, from 3,391,523 gallons of milk; $21,559, from 38,855 gallons of cream; and $5,974, from 60,842 pounds of cheese.

POULTRY AND EGGS.

Of the $3,721,427 given as the value of poultry and eggs, 50.5 per cent represents the value of eggs produced and 49.5 per cent that of poultry raised. The number of eggs produced in 1889 was 9,919,974 dozens, and in 1899, 17,242,400 dozens, an increase of 73.8 per cent.

WOOL.

The production of wool for 1899 was 3,123,455 pounds. This was the largest showing ever made for the state, and a gain of 22.0 per cent over the production of 1889. This increase is more apparent than real, owing to the fact that the fleeces of at least 217,049 sheep were omitted from the table in 1890 but included in a general estimate of wool shorn after the census enumeration.

HONEY AND WAX.

The production of honey in 1899 was 1,673,120 pounds, and of wax, 30,180 pounds. For 1889 there were 1,218,686 pounds of honey, and 22,109 pounds of wax. More than one-fourth of all farms in the state reported apiarian products.

HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses and dairy cows, the total number of these animals, and the average number per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm.
Total	74,254	185,188	2.5	80,477	205,601	2.6
White farmers	73,709	184,123	2.5	79,972	204,727	2.6
Colored farmers	545	1,065	2.0	505	874	1.7
Owners[1]	60,118	151,840	2.5	64,425	172,410	2.7
Managers	797	2,831	3.6	833	2,777	3.3
Cash tenants	4,914	10,721	2.2	5,589	11,726	2.1
Share tenants	8,425	19,796	2.3	9,630	18,688	1.9
Under 20 acres	5,783	8,829	1.5	8,643	11,927	1.4
20 to 99 acres	36,302	69,733	1.9	38,952	77,738	2.0
100 to 174 acres	18,312	50,450	2.8	18,949	55,831	2.9
175 to 259 acres	7,029	24,263	3.5	7,161	26,692	3.7
260 acres and over	6,828	31,913	4.7	6,772	33,413	4.9
Hay and grain	17,812	44,375	2.5	17,037	39,566	2.3
Vegetable	730	1,390	1.9	650	1,093	1.7
Fruit	1,089	2,439	2.2	1,081	2,258	2.1

Dairy	1,574	4,461	2.8	1,828	10,201	5.6
Tobacco	286	565	2.0	302	495	1.6
Miscellaneous[2]	20,365	42,642	2.1	26,027	52,773	2.0

[1] Including "part owners" and "owners and tenants."
[2] Including sugar farms, florists' establishments, and nurseries.

CROPS.

The following table gives the statistics of the principal crops grown in 1899.

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES OF PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	724,646	Bushels	16,610,730	$7,698,335
Wheat	447,928	Bushels	4,326,150	3,040,314
Oats	99,433	Bushels	1,833,840	637,176
Barley	253	Bushels	3,660	1,832
Rye	13,758	Bushels	111,031	58,784
Buckwheat	21,410	Bushels	267,257	134,893
Broom corn	82	Pouuds	32,570	2,029
Flaxseed	2	Bushels	7	7
Clover seed		Bushels	3,030	13,798
Grass seed		Bushels	1,354	2,311
Hay and forage	601,935	Tons	644,535	5,517,073
Tobacco	5,129	Pounds	3,087,140	228,620
Hops	1	Pounds	662	117
Peanuts	11	Bushels	199	228
Dry beans	5,221	Bushels	52,815	80,494
Dry pease	323	Bushels	3,613	3,731
Potatoes	30,123	Bushels	2,245,821	1,133,381
Sweet potatoes	3,393	Bushels	202,424	125,523
Onions	674	Bushels	136,423	107,547
Miscellaneous vegetables	28,616			1,589,481
Maple sugar		Pounds	141,550	12,273
Maple sirup		Gallons	14,874	12,998
Sorghum cane	6,870	Tons	[1] 3,392	9,795
Sorghum sirup		Gallons	450,777	180,140
Small fruits	1,994			149,391
Grapes	[2] 715	Centals	21,921	[3] 50,874
Orchard fruits	[2] 142,159			[4] 2,155,509
Nuts				4,488
Forest products				2,632,980
Flowers and plants	39			44,384
Seeds	7			760
Nursery products	548			61,700
Miscellaneous	15			5,233
Total	2,185,285			25,696,189

[1] Sold as cane.
[2] Estimated from number of vines or trees.
[3] Includiug value of raisins, wine, etc.
[4] Including value of cider, vinegar, etc.

Of the total value of crops, cereals contributed 45.0 per cent; hay and forage, 21.5 per cent; forest products, 10.2 per cent; orchard fruits, 8.4 per cent; miscellaneous vegetables, 6.2 per cent; potatoes, 4.4 per cent; and all other products, 4.3 per cent.

The average value per acre of the various crops is as follows: Flowers and plants, $1,138; nursery products, $113; miscellaneous vegetables, $56; potatoes, $38; orchard fruits, $15; hay and forage, $9; and cereals, $9. The crops yielding the highest average returns per acre were grown upon very highly improved land. Their production required a relatively great amount of labor and large expenditures for fertilizers.

CEREALS.

The following table is a statement of the cereal production since 1869.

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1869 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	253	21,410	724,646	99,433	13,758	447,928
1889	326	13,696	592,763	180,815	14,962	349,016
1879	424	30,334	565,785	126,931	17,279	393,068

[1] No statistics of acreage were secured prior to 1879.

PART 2.—BUSHELS PRODUCED.

1899	3,660	267,257	16,610,730	1,833,840	111,031	4,326,150
1889	5,387	120,469	13,730,506	2,946,653	117,113	3,634,197
1879	9,740	285,298	14,090,609	1,908,505	113,181	4,001,711
1869	50,363	82,916	8,197,865	2,413,749	277,746	2,483,543

The total area devoted to cereals in 1879, was 1,133,821 acres; in 1889, 1,151,578 acres; and in 1899, 1,307,428 acres. The total number of bushels produced in 1869 was 13,506,182, and in 1899, 23,152,668, showing an increase of 71.4 per cent in thirty years. The increases in area under cereals in the decade 1889 to 1899, were: Buckwheat, 56.3 per cent; wheat, 28.3 per cent; and corn, 22.2 per cent. The decreases were: Oats, 45.0 per cent; barley, 22.4 per cent; and rye, 8.0 per cent.

Of the total area under cereals in 1899, 55.4 per cent was devoted to corn; 34.3 per cent, to wheat; 7.6 per cent, to oats; 2.7 per cent, to rye, buckwheat, and barley.

Corn is raised in all the counties, particularly in the Kanawha Valley, Wayne, Kanawha, Jackson, and Mason counties reporting nearly one-sixth of the total area. Wheat is grown extensively in Jefferson, Berkeley, and Mason counties, these counties reporting nearly one-fifth of the total area. Hampshire, Hardy, and Morgan counties in the extreme northeast reported 61.6 per cent of the total acreage of rye. Preston county led in the production of oats and buckwheat, having reported over one-tenth of the area in oats, and almost one-third of the total acreage under buckwheat.

HAY AND FORAGE.

In 1900, 64,767 farmers, or 69.7 per cent of the total number, reported hay and forage crops. Exclusive of cornstalks and corn strippings, they obtained an average yield of 0.9 ton per acre. The total acreage in hay and forage for 1899 was 601,935, or 3.9 per cent greater than ten years before.

In 1899 the acreages and yields of the various kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 849 acres and 759 tons; millet and Hungarian grasses, 4,924 acres and 5,428 tons; alfalfa or lucern, 123 acres and 198 tons; clover, 25,170 acres and 23,521 tons; other tame and cultivated grasses, 555,787 acres and 494,467 tons; grains cut green for hay, 13,118 acres and 13,017 tons; crops grown for forage, 1,964 acres and 3,694 tons; and cornstalks and corn strippings, 137,424 acres and 103,451 tons.

In Table 18 the production of cornstalks and corn strippings is included under "hay and forage," but the acreage is included under "corn," as the forage secured was only an incidental product of the corn crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 may be seen in the following table.

TABLE 20.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900.	1890.	1899.	1889.
Apples	5,441,112	2,870,535	7,495,743	4,439,978
Apricots	1,870	1,248	145	587
Cherries	300,363	126,307	87,828	51,057
Peaches	1,695,642	450,440	18,100	376,662
Pears	110,194	23,055	19,475	15,406
Plums and prunes	187,695	35,053	19,123	3,774

The total number of fruit trees in the state in 1890 was 3,506,638, and in 1900 there were 7,748,152, showing an increase of 4,241,514, or 121.0 per cent. Increases were as follows: Cherry trees, 137.8 per cent; apple trees, 89.6 per cent; apricot trees, 49.8 per cent. Over three times as many peach trees; over four times as many pear trees; and more than five times as many plum and prune trees were reported in 1900 as in 1890.

Of all fruit trees in 1900, 70.2 per cent were apple trees; 21.9 per cent, peach trees; 3.9 per cent, cherry trees; 2.4 per cent, plum and prune trees; 1.6 per cent, pear, apricot, and unclassified fruit trees. The latter class, which is not included in the table, numbered 11,276, and yielded 1,779 bushels of fruit.

The value of orchard fruits, given in Table 18, includes the value of 28,693 barrels of cider, 9,039 barrels of vinegar, and 1,843,060 pounds of dried and evaporated fruits manufactured on the farms. Comparisons of yields, when made by decades only, have little significance, as the yield of any given year depends upon the nature of the season.

SMALL FRUITS.

Of the 1,994 acres devoted to small fruits, more than one-fourth were reported from Brooke, Harrison, Ohio, and Wood counties. Strawberries occupied 799 acres, or 40.1 per cent of the total area, and yielded 1,068,300 quarts. The acreage and production of other berries were as follows: Raspberries and Logan berries, 704 acres and 788,360 quarts; blackberries and dewberries, 367 acres and 396,850 quarts; gooseberries, 59 acres and 66,400 quarts; currants, 50 acres and 51,340 quarts; and other small fruits, 15 acres and 16,820 quarts. These small fruits were grown by 11,623 farmers, who derived therefrom an average of $12.85 per farm.

VEGETABLES.

The total value of vegetables grown in 1899, including potatoes, sweet potatoes, and onions, was $2,955,932, of which 38.3 per cent represents the value of potatoes; 4.3 per cent, that of sweet potatoes; 3.6 per cent, that of onions; and 53.8 per cent, that of miscellaneous vegetables.

In the growing of miscellaneous vegetables 28,616 acres were used. Of this area the products of 21,958 acres were not reported in detail. Of the remaining 6,658 acres, 2,109 acres were devoted to cabbages; 1,812 acres, to tomatoes; 1,416 acres, to sweet corn; 688 acres, to watermelons; 215 acres, to cucumbers; 190 acres, to muskmelons; and 228 acres, to other vegetables.

TOBACCO.

In 1899 tobacco was grown by 5,045 farmers on 5,129 acres, an average of a little over one acre for each farm reporting. From this area they produced 3,087,140 pounds, a gain in ten years of 10.4 per cent in acreage, and 18.6 per cent in production. Both the acreage and production of 1899 were the largest ever reported, the next largest being in 1889, when 4,647 acres produced 2,602,021 pounds.

The average yield per acre in 1889 was 560 pounds, while in 1899 it was 602 pounds. The total value of the crop in the latter year was $228,620, an average of $45.32 for each farm reporting, and of $44.57 per acre.

The crop was grown in 48 counties, Lincoln county leading with 1,255 acres, and Putnam and Cabell coming next in order. These three counties together reported 60.0 per cent of the total acreage, and 63.7 per cent of the total production.

SORGHUM CANE.

The present census shows that in 1899 sorghum cane was grown by 14,834 farmers on 6,870 acres, an average of 0.5 of an acre for each farm reporting. From this area they sold 3,392 tons of cane for $9,795, and from the remaining product manufactured 450,777 gallons of sirup, valued at $180,140. This was a decrease in acreage from 1889 of 11.0 per cent. The total value of sorghum-cane products in 1899 was $189,935, an average of $12.80 for each farm reporting, and of $27.65 per acre.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 39 acres, and the value of the products sold therefrom was $44,384. These flowers and plants were grown by 47 farmers and florists. Of this number, 20 made commercial floriculture their principal business. These 20 proprietors reported a glass surface of 124,710 square feet. They had invested in land, buildings, implements, and live stock, $124,060, of which $50,100 represents the value of buildings. Their sales of flowers and plants amounted to $38,650, and of other products to $2,350. The expenditure for labor was $3,845, and for fertilizers, $337. The average income for each farm reporting, including the value of products fed to live stock, was $2,050.

In addition to the 20 principal florists' establishments, 335 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 189,768 square feet, making, with the 93,532 square feet belonging to the florists' establishments, a total of 283,300 square feet.

NURSERIES.

The total value of nursery products sold in 1899 was $61,700, reported by the operators of 48 farms and nurseries. Of this number, 11 derived their principal income from the nursery business. They had invested in the aggregate $52,603, of which $38,080 represents the value of 1,563 acres of land. The value of their products in 1899 was $54,872, of which $52,462 represents the value of nursery products, and $2,410 that of other products. The expenditure for labor was $3,915, and for fertilizers, $105. The average value of all products for each farm reporting was $4,988.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $2,041,560, an average of $22 per farm. The average expenditure was $356 for nurseries, $192 for florists' establishments, $44 for dairy farms, $32 for vegetable farms, $27 for live-stock farms, $24 for hay and grain farms, $22 for fruit farms, $16 for tobacco farms, and $14 for sugar farms. "Managers" expended on an average, $74; "owners," $23; "cash tenants," $16; and "share tenants," $14. White farmers expended $22 per farm, and colored farmers, $10.

Fertilizers purchased in 1899 cost $405,270, an average of $4 per farm and an increase since 1890 of 92.3 per cent. The average expenditure was $17 for florists' establishments, $10 for nurseries, $6 for hay and grain farms, $6 for vegetable farms, $5 for fruit farms, $5 for live-stock farms, $4 for dairy farms, and $2 for tobacco farms.

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 212. WASHINGTON, D. C. June 25, 1902.

MANUFACTURES.

PENS AND PENCILS.

Hon. WILLIAM R. MERRIAM,

Director of the Census.

SIR: I transmit herewith, for publication in bulletin form, a report on the manufacture of pens and pencils during the census year ending May 31, 1900, prepared under my direction by Mr. Charles M. Karch, of the Census Office.

The statistics included in this report were collected, as in previous censuses, upon the schedule used for the general statistics of manufactures. But in order to present properly the important features of the several industries, it was decided to give them more detailed treatment than is given to manufacturing industries in general, or than these industries have received heretofore, and, for this purpose, to supplement by correspondence the canvass made by the enumerators and local special agents.

This report is divided into four parts, which relate respectively to the manufacture of fountain and stylographic pens, gold pens, steel pens, and lead pencils. A brief historical sketch for each industry is included in the report.

The statistics are presented in 30 tables. Tables 1 and 2 relate to the combined industry, as follows: Table 1, a summary of the four industries; Table 2, quantities and values of pens—fountain, stylographic, gold, and steel—and lead pencils, manufactured during the census year, irrespective of the classification of the establishments by industries.

Tables 3 to 9, inclusive, relate to the manufacture of fountain and stylographic pens, as follows: Table 3, a comparative summary, 1890 and 1900; Table 4, number of establishments, by states arranged geographically, 1890 and 1900; Table 5, a comparative summary of the statistics of capital for 1890 and 1900; Table 6, cost of materials used for 1900; Table 7, quantity and value of all products of fountain and stylographic pen establishments, 1900; Table 8, quantity and value of fountain and stylographic pens manufactured during the census year, as reported by establishments of any character; Table 9, the detailed statistics for the industry in 1900, by states.

Tables 10 to 16, inclusive, relate to the manufacture of gold pens as follows: Table 10, a comparative summary, 1880 to 1900; Table 11, the number of establishments in operation in 1890 and 1900, by states; Table 12, the statistics of capital for 1890 and 1900; Table 13, cost of materials used for 1900; Table 14, the quantity and value of all products of gold pen establishments for 1900; Table 15, the quantity and value of gold pens manufactured during the census year as reported by establishments of any character; Table 16, the detailed statistics for the industry in 1900, by states.

Tables 17 to 23, inclusive, relate to the manufacture of steel pens, as follows: Table 17, a comparative summary, 1870 to 1900; Table 18, the number of establishments in operation in 1890 and 1900, by states; Table 19, the statistics of capital for 1890 and 1900; Table 20, the cost of materials used for 1900; Table 21, the quantity and value of products of steel pen establishments for 1900; Table 22, the quantity and value of steel pens manufactured during the census year as reported by establishments of any character; Table 23, the detailed statistics for the industry in 1900, by states.

Tables 24 to 30, inclusive, relate to the manufacture of lead pencils, as follows: Table 24, a comparative summary, 1860 to 1900; Table 25, the number of establishments in operation in 1890 and 1900, by states; Table 26, the statistics of capital for 1890 and 1900; Table 27, the cost of materials used for 1900; Table 28, the quantity and value of all products of lead pencil establishments for 1900; Table 29, the quantity and value of lead pencils manufactured during the census year, as reported by establishments of any character; Table 30, the detailed statistics for the industry in 1900, by states.

Owing to changes in the method of taking the census, comparisons between the earlier and later decades, represented in Tables 10, 17, and 24, should be drawn only in the most general way. Nevertheless, the growth of the industries may be approximately measured from the figures given.

In drafting the schedules of inquiry for the census of 1900, care was taken to preserve the basis of comparison with prior censuses. Comparison may be made safely with respect to all the items of inquiry except those relating to capital, salaried officials, clerks, etc., and their salaries, the average number of employees, and the total amount of wages paid. Live capital, that is, cash on hand, bills receivable, unsettled ledger accounts, raw materials, stock in process of manufacture, finished products on hand, and other sundries, was first called for at the census of 1890. No definite attempt was made, prior to the census of 1890, to secure a return of live capital invested.

Changes were made in the inquiries relating to employees and wages in order to eliminate defects found to exist on the form of inquiry adopted in 1890. At the census of 1890 the average number of persons employed during the entire year was called for, and also the average number employed at stated weekly rates of pay, and the average number was computed for the actual time the establishments were reported as being in operation. At the census of 1900 the greatest and least numbers of employees were reported, and also the average number employed during each month of the year. The average number of wage-earners (men, women, and children) employed during the entire year was ascertained by using 12, the number of calendar months, as a divisor into the total of the average numbers reported for each month. This difference in the method of ascertaining the average number of wage-earners during the entire year may have resulted in a variation in the number, and should be considered in making comparisons.

At the census of 1890 the number and salaries of proprietors and firm members actively engaged in the business or in supervision were reported, combined with clerks and other officials. In cases where proprietors and firm members were reported without salaries, the amount that would ordinarily be paid for similar services was estimated. At the census of 1900 only the number of proprietors and firm members actively engaged in the industry or in supervision was ascertained, and no salaries were reported for this class. It is therefore impossible to compare the number and salaries of salaried officials of any character for the two censuses.

Furthermore, the schedules for 1890 included in the wage-earning class, overseers, foremen, and superintendents (not general superintendents or managers), while the census of 1900 separates from the wage-earning class such salaried employees as general superintendents, clerks, and salesmen. It is possible and probable that this change in the form of the question has resulted in eliminating from the wage-earners, as reported by the present census, many high-salaried employees included in that group for the census of 1890.

In some instances the number of proprietors and firm members, shown in the accompanying tables, falls short of the number of establishments reported. This is accounted for by the fact that no proprietors or firm members are reported for corporations or cooperative establishments.

The reports show a capital of $3,671,741 invested in the manufacture of pens and pencils in the 55 establishments reporting for the United States. This sum represents the value of land, buildings, machinery, tools, and implements, and the live capital utilized, but does not include the capital stock of any of the manufacturing corporations engaged in these industries. The value of the products is returned at $4,222,148, to produce which involved an outlay of $281,636 for salaries of officials, clerks, etc.; $1,192,405 for wages; $471,655 for miscellaneous expenses, including rent, taxes, etc.; and $1,747,852 for materials used, mill supplies, freight, and fuel. It is not to be assumed, however, that the difference between the aggregate of these sums and the value of the products is, in any sense, indicative of the profits in the manufacture of pens and pencils during the census year. The census schedule takes no cognizance of the cost of selling manufactured articles, or of interest on capital invested, or of the mercantile losses incurred in the business, or of depreciation in plant. The value of the product given is the value as obtained or fixed at the shop or factory. This statement is necessary in order to avoid erroneous conclusions from the figures presented.

Very respectfully,

S. N. D. North

Chief Statistician for Manufactures.

PENS AND PENCILS.

By Charles M. Karch.

The statistics of the manufacture of pens and pencils in the United States at the census of 1900 are presented in this report under the following groups: Pens, fountain and stylographic; pens, gold; pens, steel; and lead pencils. Statistics for each of these groups are shown separately in this report.

A summary for the combined industry, as reported for 1900, is presented in Table 1.

Table 1.—PENS, FOUNTAIN, GOLD, AND STEEL, AND PENCILS, LEAD: SUMMARY FOR THE UNITED STATES, 1900.

	Total.	Pens, fountain and stylographic.	Pens, gold.	Pens, steel.	Pencils, lead.
Number of establishments	55	23	22	3	7
Capital	$3,671,741	$590,629	$496,246	$357,460	$2,227,406
Land	$212,950	$8,150	$33,000	$20,000	$151,800
Buildings	$317,132	$13,632	$7,000	$43,000	$253,500
Machinery, tools, and implements	$535,574	$79,074	$129,775	$82,000	$244,725
Cash and sundries	$2,606,085	$489,773	$326,471	$212,460	$1,577,381
Salaried officials, clerks, etc., number	240	84	62	13	81
Salaries	$281,636	$80,808	$67,522	$21,416	$111,890
Wage-earners, average number	3,331	318	378	473	2,162
Total wages	$1,192,405	$141,012	$229,679	$138,433	$683,281
Miscellaneous expenses	$471,655	$113,334	$42,740	$37,405	$278,176
Cost of materials used	$1,747,852	$351,932	$312,537	$52,466	$1,030,917
Value of products	$4,222,148	$906,454	$799,078	$294,340	$2,222,276

It appears from Table 1 that pens, fountain and stylographic, led in the number of establishments reporting in 1900, closely followed by the gold pen industry, which reported but 1 establishment less. Of the total amount of capital invested in the four industries, lead pencils, with 7 establishments, contributed 60.7 per cent; steel pens, with 3 establishments, 9.7 per cent; gold pens, with 22 establishments, 13.5 per cent; fountain and stylographic pens, with 23 establishments, 16.1 per cent. Of the total value of products for the four industries, that reported for lead pencils formed 52.6 per cent; for fountain and stylographic pens 21.5 per cent; for gold pens, 18.9 per cent; and for steel pens, 7.0 per cent.

It should be noticed, however, that the four industries are very closely allied, and in many instances overlap. Many establishments principally engaged in manufacturing fountain and stylographic pens produced gold pens and lead pencils; and establishments principally engaged in the manufacture of gold pens reported fountain and stylographic pens and lead pencils as subsidiary products; while establishments reporting lead pencils as the principal product manufactured pens as a secondary product. In the tabulation of the reports the rule was adopted of classifying establishments in accordance with the predominating product. In following out this plan, in many instances a product that appears as the principal product of one of the industries included in this report may appear again as a subsidiary product of one or more of the other industries.

Table 2 shows the production of pens, fountain, stylographic, gold and steel, and of lead pencils, manufactured during the census year, irrespective of the classification of the establishments in which they were produced, and it seems as convenient to present this information here as at any place in the report.

Table 2.—SUMMARY: KINDS, QUANTITIES, AND VALUE OF PRODUCTS, BY STATES, 1900.

PRODUCTS.	United States.	New York.	All others.
Aggregate value	$4,119,809	$2,337,788	$1,782,021
Pens: Total value	$1,855,658	$1,004,401	$851,257
Fountain—Gross	8,028	3,760	4,268
Value	$902,734	$567,667	$335,067
Stylographic—Gross	1,803	1,613	196
Value	$82,676	$71,684	$10,992
Gold—Gross	6,735	5,210	1,525
Value	$458,376	$365,050	$93,326
Steel—Gross	1,764,079	....	1,764,079
Value	$411,872	....	$411,872
Pencils, lead: Total value	$2,264,151	$1,333,387	$930,764
Wood—Gross	1,653,973	909,170	744,803
Value	$2,053,484	$1,151,495	$901,989
Gold—Gross	31	26	5
Value	$32,526	$32,326	$200
Silver—Gross	2,281	2,055	226
Value	$111,518	$102,718	$8,800
Plated—Gross	3,988	3,204	784
Value	$64,523	$46,848	$17,675
Other varieties—Gross	581	....	581
Value	$2,100	....	$2,100

The aggregate value of the pens and pencils produced in the United States during the census year was $4,119,809, of which 45 per cent represented the value of pens and 55 per cent that of pencils. New York state produced 56.7 per cent of the aggregate product; and "all others," comprising those states which reported less than 3 establishments, and which are shown collectively in order to avoid disclosing the operations of individual establishments, manufactured 43.3 per cent of the entire output of pens and pencils. Of the total production of pens, 54.1 per cent were manufactured in New York state. Fountain and stylographic pens represented 53.1 per cent of the total value of pens produced, gold pens 24.7 per cent, and steel pens 22.2 per cent. New York led also in the manufacture of pencils during the census year, having produced 58.9 per cent of the total output. Lead pencils inclosed in wooden cases contributed 90.7 per cent of the total value of pencils.

The lack of uniformity in the value of the products manufactured by the establishments located in the various states is due to the variation in the quality of materials used and the design and workmanship of the articles produced. This difference in the value of the various designs is particularly noticeable in the statistics presented in the accompanying tables for establishments engaged in the manufacture of fountain, stylographic, and gold pens, and lead pencils incased in silver and gold.

Attention should be here directed to the fact that the figures reported in Table 2 possibly do not represent the total quantity and value of pens and pencils manufactured in the United States during the census year. Establishments engaged primarily in other industries may have manufactured one or more of these articles as a subsidiary product and made no direct mention of that fact in their returns. Notwithstanding these facts the figures reported may be accepted as fairly representing the quantities and values of pens and pencils manufactured during this period.

FOUNTAIN AND STYLOGRAPHIC PENS.

Although fountain and stylographic pens were manufactured in the United States prior to 1890, the census of that year was the first to publish separate statistics for the industry. The manufacture was successfully established as early as 1880, but it was included under some other classification in that year. At the close of the first ten years of its existence the industry was established in 6 states and had in operation 15 plants, well capitalized and reporting a considerable product.

Table 3 is a comparative summary of the statistics for the manufacture of fountain and stylographic pens as returned at the censuses of 1890 and 1900, with the percentages of increase for the decade.

Table 3.—PENS, FOUNTAIN AND STYLOGRAPHIC: COMPARATIVE SUMMARY, 1890 AND 1900, WITH PER CENT OF INCREASE FOR THE DECADE.

	DATE OF CENSUS.		PER CENT OF INCREASE.
	1900	1890	1890 to 1900
Number of establishments	23	15	53.3
Capital	$590,629	$142,265	315.2
Salaried officials, clerks, etc., number	84	[1]24	250.0
Salaries	$80,808	[1]$28,902	179.6
Wage-earners, average number	318	152	109.2
Wages	$141,012	$73,897	90.8
Men, 16 years and over	241	128	88.3
Wages	$122,777	$67,822	81.0
Women, 16 years and over	66	24	175.0
Wages	$16,008	$6,075	163.5
Children, under 16 years	11		
Wages	$2,227		
Miscellaneous expenses	$113,334	$12,380	815.5
Cost of materials used	$351,932	$123,214	185.6
Value of products	$906,454	$351,775	157.7

[1] Includes proprietors and firm members, with their salaries; number only reported in 1900, but not included in this table. (See Table 9.)

The table shows that during the decade the industry made rapid advancement, not only in number of establishments, but also in the amount of capital invested and the value of products. The percentage of increase in the number of women and children employed, as compared with the percentage of increase in the number of men employed, would indicate that some branches of the work performed by men in 1890 were done by women and children in 1900. Each item in Table 3 shows a good percentage of increase for the decade, and indicates that although the industry is yet in its infancy, it is firmly established and in a healthy and prosperous condition.

Table 4 presents, by states arranged geographically, the number of establishments actively engaged in the manufacture of fountain pens in 1890 and in 1900, and the increase for the decade.

Table 4.—PENS, FOUNTAIN AND STYLOGRAPHIC: COMPARATIVE SUMMARY; NUMBER OF ESTABLISHMENTS 1890 AND 1900, AND INCREASE DURING THE DECADE, BY STATES ARRANGED GEOGRAPHICALLY.

STATES.	1900	1890	Increase.
United States	23	15	8
New England states	5	5	
Connecticut	2	1	1
Massachusetts	2	3	[1]1
Rhode Island	1	1	
Middle states	11	9	2
New York	9	8	1
Pennsylvania	2	1	1
Central states	7	1	6
Illinois		1	[1]1
Indiana	1		1
Iowa	1		1
Ohio	4		4
Wisconsin	1		1

[1] Decrease.

It appears from Table 4 that there were 8 more establishments engaged in this industry in 1900 than in 1890, showing an increase of 53.3 per cent for the decade. The largest addition to the number of establishments was made by Ohio, which reported 4 establishments in 1900, having none in 1890. Massachusetts and Illinois reported decreases of 1 establishment each.

Table 5 is a comparative summary of capital as returned at the censuses of 1890 and 1900, with the per cent each item is of the total and the per cent of increase for the decade.

TABLE 5.—PENS, FOUNTAIN AND STYLOGRAPHIC: CAPITAL, 1890 AND 1900.

	1900		1890		Per cent of increase.
	Amount.	Per cent of total.	Amount.	Per cent of total.	
Total	$590,629	100.0	$142,265	100.0	315.2
Land	8,150	1.4	3,100	2.2	162.9
Buildings	13,632	2.3	3,600	2.5	278.7
Machinery, tools, and implements	79,074	13.4	36,625	25.7	115.9
Cash and sundries	489,773	82.9	98,940	69.6	395.0

The most important item reported under the head of capital, both in 1890 and in 1900, was that of cash and sundries, including cash on hand, bills receivable, unsettled ledger accounts, raw materials, stock in process of manufacture, finished products on hand, and other sundries. In 1890 this item represented 69.6 per cent of the total, and in 1900, 82.9 per cent, the increase for the decade being $390,833, or 395 per cent. The items of land, buildings, and machinery, tools, and implements, each show a large percentage of increase for the decade, but represent a smaller per cent of the total in 1900 than in 1890. The smallest increase and the most considerable reduction of percentage of the total is shown by machinery, tools, and implements, indicating that there has been but little progress made during the ten years in the way of application of new and improved machinery in this industry. The amounts reported for land, buildings, and machinery represent only such as are owned by the establishments engaged in the industry, and do not include the value of leased property.

Table 6 shows the cost of materials for 1900, and the proportion of each item to the whole amount.

TABLE 6.—PENS, FOUNTAIN AND STYLOGRAPHIC: COST OF MATERIALS USED, 1900.

	Amount.	Per cent of total.
Total	$351,932	100.0
Principal materials	347,201	98.7
Purchased in raw state	10,000	2.9
Purchased in partially manufactured form[1]	337,201	95.8
Fuel	864	0.2
Rent of power and heat	3,224	0.9
Freight	643	0.2

[1] Includes mill supplies and all other materials, which are shown separately in Table 9.

Materials purchased in partially manufactured form represented 95.8 per cent of the total cost of materials. This item includes those reported under Table 9, as "mill supplies" and "all other materials." "Mill supplies" consisted of materials, such as oil, waste, belting, and other articles which did not enter into the product, but were necessary to the process of manufacture. "All other materials" comprised those not otherwise specified in the schedule of inquiry and included such articles as boxes, bags, and packages. Materials purchased in raw state are those upon which no manufacturing force has been expended. The amount paid for fuel included that used both for motive power and for heating purposes, and is correlative with the amount paid for rent of power and heat leased from other establishments. Some establishments found it impossible, in making returns, to separate from the cost of materials the amount paid for freight, and reported the two together. For that reason, the amount of freight paid, as shown in Table 6, does not represent the entire cost of freight and should be considered only in connection with the cost of materials.

Table 7 shows in detail, by states, the quantity and value of fountain and stylographic pens manufactured during the census year, and the subsidiary products reported by the establishments engaged in this industry.

TABLE 7.—PENS, FOUNTAIN AND STYLOGRAPHIC: QUANTITY AND VALUE OF PRODUCTS, BY STATES: 1900.

STATES.	AGGREGATE VALUE.	PRODUCTS.											
		Total gross.	Total value.	Pens.									
				Total gross.	Total value.	Fountain (complete).		Gold.		Stylographic.		Other varieties.	
						Gross.	Value.	Gross.	Value.	Gross.	Value.	Gross.	Value.
Total	$906,454	8,695	$842,248	8,113	$832,748	5,836	$707,023	584	$47,945	1,686	$77,280	7	$500
New York	524,079	3,396	502,363	3,396	502,363	1,806	417,123	80	18,000	1,510	67,240		
Ohio	52,000	650	38,985	650	38,985	165	12,000	365	21,945	120	5,040		
All other states[1]	330,375	4,649	300,900	4,067	291,400	3,865	277,900	139	8,000	56	5,000	7	500

[1] Includes establishments distributed as follows: Connecticut, 2. Indiana, 1; Iowa, 1; Massachusetts, 1; Pennsylvania, 2; Rhode Island, 1; Wisconsin, 1.

TABLE 7.—PENS, FOUNTAIN AND STYLOGRAPHIC: QUANTITY AND VALUE OF PRODUCTS, BY STATES: 1900—Continued.

STATES.	PRODUCTS—continued. Pencils. Total gross.	Total value.	Gold. Gross.	Gold. Value.	Plate. Gross.	Plate. Value.	Other varieties. Gross.	Other varieties. Value.	ALL OTHER PRODUCTS. Value.
Total	582	$9,500	5	$200	521	$8,000	56	$1,300	$64,206
New York									21,716
Ohio									13,015
All other states[1]	582	9,500	5	200	521	8,000	56	1,300	29,475

[1] Includes establishments distributed as follows: Connecticut, 2; Indiana, 1; Iowa, 1; Massachusetts, 1; Pennsylvania, 2; Rhode Island, 1; Wisconsin, 1.

Of the total value of the products of the establishments engaged in this industry, New York produced 59.6 per cent. The overlapping of the industries is very strikingly exemplified in the above table, especially in the production of gold pens.

The tables which have thus far been shown for this industry give an incomplete statement of the quantity and value of fountain and stylographic pens manufactured during the census year because of the rule adopted, as explained above, of classifying establishments according to the predominating product.

Table 8 makes up for this deficiency by showing the total quantity and value of fountain and stylographic pens produced during the census year, as reported by establishments of any character.

TABLE 8.—PENS, FOUNTAIN AND STYLOGRAPHIC: QUANTITY AND VALUE OF PRODUCTS, BY STATES, 1900.

STATES.	Total.	FOUNTAIN. Gross.	FOUNTAIN. Value.	STYLOGRAPHIC. Gross.	STYLOGRAPHIC. Value.
United States	$985,410	8,028	$902,734	1,803	$82,676
New York	639,351	3,760	567,667	1,613	71,684
Ohio	47,740	346	42,000	130	5,740
All other states[1]	298,319	3,922	293,067	60	5,252

[1] Includes establishments distributed as follows: Connecticut, 2; Illinois, 2; Indiana, 1; Iowa, 1; Massachusetts, 1; Pennsylvania, 2; Rhode Island, 2; Wisconsin, 1.

Table 8 includes the quantity and value both of the fountain and stylographic pens produced in establishments engaged principally in their manufacture, and of those reported as a subsidiary product in establishments engaged primarily in the manufacture of gold pens and lead pencils. The values reported do not include the amounts reported as the value of "all other products," in the tables showing products by establishments, therefore the totals given in Table 8 do not agree with the totals elsewhere given in this report, or with those dealing with this industry in the general report on Manufactures, Parts I and II.

HISTORICAL AND DESCRIPTIVE.

Fountain pens are the most modern variety of pens made and represent the highest type of the pen-maker's art. The first successful manufacture of these pens in the United States dates back but twenty-one years before the taking of the Twelfth Census, although attempts were made to manufacture them before that time. They were manufactured in England as early as 1835, but they were not satisfactory enough to warrant their use to any extent.[1] At that time there were two fountain pens invented, known as the Schaeffer pen and the Parker hydraulic pen. Schaeffer's pen had a reservoir for ink in the holder and the ink was admitted to the pen by the pressure of the thumb on a projecting stud. Parker's pen also had a reservoir in the holder, which contained a piston operated by a screw stem and a nut on the end of the holder. The lower end of the reservoir being dipped in ink, the piston was drawn up by rotating the nut, thus filling the reservoir. The ink was ejected as required by a reverse motion of the thumb nut. The early attempts to construct fountain pens were generally confined to the invention of contrivances such as internal tubes, ducts, valves, or springs, which were operated upon by the action of the nibs, and which forced the ink from a feeding pipe upon the pen, assisted by air admitted at the top of the holder

[1] Universal Cyclopædia, vol. 9, page 198.

to take the place of the exhausted ink. Pens dependent upon such mechanism were very erratic in their work, as the ink flowed either too slow or too fast. After many experiments to secure a continuous and properly regulated flow of ink into the pen, it was found that the best results were obtained by the use of a tubular holder tightly closed at its upper end, and at the lower end fitted with an ordinary nib pen made of gold, with an ink feeder lying adjacent to the pen to attract the ink from the reservoir. As the ink in the process of writing is withdrawn, air enters at the lower end of the holder and ascends in globules through the column of ink to fill the space left vacant. There are many varieties of fountain pens made in the United States, but the basic principles underlying all are practically the same, the retention of the ink by atmospheric pressure and the furnishing of a supply ready for use throughout many hours of continuous writing.

The stylographic pen is a variety of fountain pen in which a blunt needle incased in a sheath at the end of the holder serves as a valve to release the ink when the point is pressed on the paper.

Table 9 presents a detailed statement of the statistics for the fountain and stylographic pen industry, by states, 1900.

GOLD PENS.

Although the manufacture of gold pens was carried on successfully as early as 1850, the census reports on this industry prior to 1880 were not sufficiently accurate to justify their use in comparisons with later censuses to show the growth of the industry. The census of 1850 reported the manufacture of pens under the general classification of pens and pencils, and, as there was but a small amount of pencils, and a very limited amount, if any, of steel, fountain, and stylographic pens produced in the United States at that time, a very large proportion of the value of the products reported for that year was obviously that of gold pens. In the census of 1860 the manufacture of gold pens was reported as a subdivision of jewelry, and the reports show that there were then 9 establishments engaged in the industry, with a capital of $32,500, employing 89 people at a cost of $32,228, and manufacturing products to the value of $113,600. The census of 1870 reported the industry in connection with the manufacture of gold pencils. The statistics for these combined industries in 1870 showed that there were 21 establishments engaged in the manufacture of gold pens and pencils, and that they had a capital of $268,250, and a product of $467,380. The growth of the gold pen industry since 1880 has been gradual but satisfactory, as is shown by the statistics presented in the following tables.

Table 10 is a comparative summary of the statistics of the manufacture of gold pens as returned at the censuses of 1880 to 1900, inclusive, with the percentage of increase for each decade.

TABLE 10.—PENS, GOLD: COMPARATIVE SUMMARY, 1880 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

	DATE OF CENSUS.			PER CENT OF INCREASE.	
	1900	1890	1880	1890 to 1900	1880 to 1890
Number of establishments	22	18	16	22.2	12.5
Capital	$496,246	$473,964	$370,150	4.7	28.0

Children, under 16 years	3	1	19	200.0	[4]94.7
Wages	$300	$104	(2)	188.5	......
Miscellaneous expenses	$42,740	$82,753	(3)	[4]48.4	......
Cost of materials used	$312,537	$235,628	$190,906	32.6	23.4
Value of products, including custom work and repairing	$799,078	$718,070	$533,061	11.3	34.7

[1] Includes proprietors and firm members, with their salaries; number only reported in 1900, but not included in this table. (See Table 16.)
[2] Not reported separately.
[3] Not reported.
[4] Decrease.

It appears from Table 10 that for the decade oetween 1880 and 1890 the increase in capital and value of products was comparatively large, and in number of establishments, comparatively small; while for the decade between 1890 and 1900 the increase in number of establishments was greater than in the preceding decade, yet the capital increased hardly at all, and the value of products little.

Table 11 presents, by states, the number of establishments actively engaged in the manufacture of gold pens in 1890 and 1900, with the increase for the decade.

TABLE 11.—PENS, GOLD: NUMBER OF ESTABLISHMENTS, BY STATES, 1890 AND 1900.

STATES.	1900	1890	Increase.
United States	22	18	4
California	1	1	....
Illinois	2	....	2
Maryland	1	....	1
Massachusetts	1	1	....
Michigan	1	1	....
Nebraska	....	1	[1]1
New York	14	12	2
Ohio	1	1	....
Rhode Island	1	1	....

[1] Decrease.

Two-thirds of the establishments, both in 1890 and 1900, were located in New York. During the decade there was a net increase of 4 establishments in the United States; Illinois and New York contributing 2 each, and Maryland 1. The only state showing a decrease was Nebraska, which reported 1 establishment in 1890 and none in 1900.

A comparative summary of capital in its several subdivisions for 1890 and 1900, giving percentages of increase between the two census years, and the proportion of each item to the total for those years, is presented in Table 12.

TABLE 12.—PENS, GOLD: CAPITAL, 1890 AND 1900.

	1900		1890		Per cent of increase.
	Amount.	Per cent of total.	Amount.	Per cent of total.	
Total	$496,246	100.0	$473,964	100.0	4.7
Land	33,000	6.6	12,000	2.5	175.0
Buildings	7,000	1.4	8,000	1.7	[1]12.5
Machinery, tools, and implements	129,775	26.2	129,120	27.3	0.5
Cash on hand, and sundries	326,471	65.8	324,844	68.5	0.5

[1] Decrease.

In this industry, as in the other industries reported in this bulletin, cash and sundries, including bills receivable, unsettled ledger accounts, etc., was the largest item reported in the table, but this item was only a little larger in 1900 than in 1890. The item for machinery, tools, and implements formed a considerable proportion of the total amount of capital for the years 1890 and 1900, indicating that machinery is extensively used in the industry, but from the very insignificant percentage of increase in this item during the decade, it is evident that very little new machinery has been added. The items of land and buildings each form but a small percentage of the total capital; the value of the land, however, increased during the decade $21,000, while the value of the buildings decreased $1,000.

The cost of materials used in the manufacture of gold pens in 1900, and the cost of each item, with its percentage of the whole amount, are presented in Table 13.

TABLE 13.—PENS, GOLD: COST OF MATERIALS USED, 1900.

	Amount.	Per cent of total.
Total	$312,537	100.0
Principal materials[1]	308,545	98.7
Fuel	982	0.3
Rent of power and heat	3,010	1.0

[1] Includes items for mill supplies and all other materials, which are shown separately in Table 16.

By far the largest item shown in Table 13, covering almost the entire cost, is that reported for principal materials, which includes not only the materials purchased in partially manufactured form, but all materials that are used in the manufacture of gold pens. The largest part of this item consists of materials purchased in partially manufactured form. This item alone was $283,089, or 90.6 per cent of the total cost of materials. The materials used were principally gold bullion and iridium, but other metals were used to some extent.

Table 14 is a detailed statement, by states, of the quantity and value of gold pens manufactured during the census year by the establishments principally engaged in this industry, and the subsidiary products reported by them.

TABLE 14.—GOLD PENS: QUANTITY AND VALUE OF PRODUCTS, BY STATES, 1900.

STATES.	AGGREGATE VALUE.	PRODUCTS.									
		Total gross.	Total value.	Pens.							
				Total gross.	Total value.	Gold.		Fountain (complete).		Stylographic.

New York	3,317	119,602	26	32,326	569	59,222	2,722	28,054	79,836
All other states[1]	489	18,475	....	....	226	8,800	263	9,675	13,410

[1] Includes establishments distributed as follows: Illinois, 1; Maryland, 1; Massachusetts, 1; Michigan, 1; Ohio, 1; Rhode Island, 1.

In this industry, as in the manufacture of fountain and stylographic pens, New York led, producing almost five times as much as all other states combined. The overlapping of the industries is more strikingly exemplified in this industry than in the manufacture of fountain and stylographic pens, the principal product of gold pen establishments making up only 52.1 per cent of the total number of gross produced, while in fountain and stylographic pen establishments the principal product furnished 86.5 per cent of the total.

The tables which have thus far been shown for this industry do not give complete statistics of the quantity and value of gold pens produced during the census year, because of the rule adopted of classifying establishments according to the predominating product. Table 15 shows the total quantity and value of gold pens produced during the census year as reported by establishments of any character.

TABLE 15.—PENS, GOLD: QUANTITY AND VALUE OF PRODUCTS, BY STATES, 1900.

STATES.	Gross.	Value.
United States	6,735	$458,376
New York	5,210	365,050
All other states[1]	1,525	93,326

[1] Includes establishments distributed as follows: Illinois, 2; Maryland, 1; Massachusetts, 2; Michigan, 1; Ohio, 2; Rhode Island, 1.

Table 15 includes the quantity and value of gold pens produced in establishments engaged primarily in this industry, and also the quantity and value reported as a subsidiary product of establishments engaged in the manufacture of fountain and stylographic pens and lead pencils. The values reported in Table 15 do not include the amounts reported as the value of any other products, therefore the totals given in this table do not agree with the totals elsewhere given with those of the general report on Manufactures, Parts I and II.

HISTORICAL AND DESCRIPTIVE.

The manufacture of gold pens was commenced in the United States in 1835 by a watchmaker of Detroit, Mich. Attempts had been made in England to make gold pens prior to that time, but they met with little success. Alloyed gold is too soft to make a durable point, and this circumstance made it necessary to protect the pen points with diamonds or rubies until John Isaac Hawkins, a citizen of the United States, but residing in England while the experiments in the manufacture of the gold pen were in progress there, accidentally discovered that the native alloy of iridium and osmium, one of the hardest and most refractory of all metallic alloys, could be used for protecting the points to much better advantage and more cheaply. Hawkins' rights were purchased by a clergyman of Detroit, Mich., who induced the watchmaker above mentioned to manufacture gold pens. The first pens made by him were very poor substitutes for the quill then in use. In 1840 his plant was taken to New York, where the business was enlarged. Quite an improvement was added to the plant by the machines, for the making and tempering of the pens, invented by John Rendell, one of the employees of the establishment. This establishment soon produced a gold pen so perfect that it combined the elasticity of the quill with the permanency of the metal. About 1850 it was discovered that by embedding the iridium points in the gold instead of soldering them on, the corrosive influence of the ink on the two metals, the solder and the gold, was avoided, and a firmer hold in the pen was given to the points.[1]

The gold pen has been brought to its present degree of perfection by the American manufacturer, and the industry from its inception has been characterized by the use of American methods. For the production of the gold pen a high degree of skill is necessary, and only experts are employed in the different plants.

The gold used in the making of the pens is obtained from the United States Assay Office. It is then melted and alloyed to about 16 carats fine, and rolled into a long narrow ribbon from which pen blanks or flat plates in the shape of a pen, but considerably thicker than the finished pen, are cut by means of a lever press or die and punch. The blunt nib of the blank is notched or recessed at the end to receive the iridium that forms the exceedingly hard point which all good gold pens possess. The iridium is coated with a cream of borax ground in water, and laid in the notch formed in the end of the blank. It is then secured by a process of sweating, which is nothing more nor less than melting the gold of which the pen is formed so that it unites solidly with the iridium. The blank is then passed between rollers of peculiar form to give a gradually diminishing thickness from the point backward. The rolls have a small cavity in which the extreme end of the iridium-pointed nib is placed, to prevent injury to the iridium. After rolling, the nib of every pen is stiffened and rendered spongy by hammering. This is the most important process in the manufacture of the pen, as the elasticity of the nib depends entirely upon this operation. The pen is then trimmed by a press similar to that which is used for cutting out the blanks, or by automatic machinery. When the blank has been trimmed, the name of the manufacturer and the number of the pen are stamped on it by means of a screw press. The pen is given its convex surface also by means of a screw press, the blank being pressed between a concave die beneath and a convex one above. Quite a little force is necessary to bring the pen to the required convexity, and when this operation is completed, two jaws approach the blank and press it up on the opposite edges, thus giving the pen its final shape. The next step is to cut the iridium into two points by holding it on the edge of a very thin copper disk, which is charged with fine emery and oil and revolves at a high speed. The nib is then slit by a machine and the slit cleared by means of a fine circular saw. After slitting, the nibs are brought together by hammering, and the pen burnished on the inside in a concave form and on the outside in a convex form. This is necessary in order to give the pen a uniform surface and greater elasticity. These nibs are then set by the fingers alone, after which operation the pen is ground by a lathe with a thin steel disk and a copper cylinder, both charged with fine emery and oil. The slit is then ground by a thin disk and the sides of the nibs and the points are ground upon the copper cylinder. After the grinding is done the pen is polished upon buff wheels, which completes the process of manufacture. Before the pen is placed upon the market, however, it is given a thorough inspection to see that it possesses the proper elasticity, fineness and weight, then passed to an inspector who tests it and weighs it.

Table 16 is a detailed statement of the statistics for the manufacture of gold pens, by states, 1900.

STEEL PENS.

The steel pen manufacture was successfully established in the United States by 1860, but the statistics of the industry were not separately reported until the census of 1870. Its growth since that time, though slow, has been satisfactory, until to-day the home manufacturer not only supplies three-fourths of the home trade, but exports a considerable quantity.

The statistics for the manufacture of steel pens, as returned at the censuses of 1870 to 1900, inclusive, with the percentages of increase for each decade, are presented in Table 17.

TABLE 17.—PENS, STEEL: COMPARATIVE SUMMARY, 1870 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

	DATE OF CENSUS.				PER CENT OF INCREASE.

[1] Decrease.
[2] Includes proprietors and firm members with their salaries; number only reported in 1900, but not included in this table. (See Table 23.)
[3] Not reported separately.
[4] Not reported.

It appears from Table 17 that the period of the industry's greatest growth was from 1880 to 1890. By a singular coincidence the number of establishments engaged in the industry has been the same at the several censuses. This does not necessarily mean that the establishments reporting in 1900 are individually the same establishments that reported in 1870, 1880, and 1890, although it is more than probable that one or more of the establishments reported in 1900 was actively engaged in the business in previous census years. During the whole period between 1870 and 1900, the capital invested in the industry increased $182,460, and the products $114,340. Between 1890 and 1900 the value of the products increased very slightly, and the amount of capital showed a decrease of 10.5 per cent. The large number of women employed in the manufacture as compared with the number of men is to be expected in an industry using machinery that requires but little skill and strength to operate.

Table 18 presents, by states, the number of establishments actively engaged in the manufacture of steel pens in 1890 and 1900, with the increases and decreases for the decade.

TABLE 18.—PENS, STEEL: NUMBER OF ESTABLISHMENTS, BY STATES, 1890 AND 1900.

STATES.	1900	1890	Increase.
United States	3	3	....
Connecticut	....	1	[1]1
New Jersey	1	1	....
Ohio	1	....	1
Pennsylvania	1	1	....

[1] Decrease.

During the decade 1 plant was established in Ohio, which in 1890 had none. Owing to the plan adopted by this census of classifying establishments in accordance with the predominating product, it is probable that the establishment engaged in this industry in Connecticut in 1890 was reported under some other classification in 1900. An examination of the returns for that state shows that steel pens were manufactured there during the census year, 1900, and the quantity and value of such product is included in Table 22.

In Table 19 is presented a comparative summary, for 1890 and 1900, of the capital in its several subdivisions, with the percentage that each item is of the total in the two census years, and percentages of increase for the decade.

TABLE 19.—PENS, STEEL: CAPITAL, 1890 AND 1900.

	1900		1890		Per cent of increase.
	Amount.	Per cent of total.	Amount.	Per cent of total.	
Total	$357,460	100.0	$399,182	100.0	[1]10.5
Land	20,000	5.6	36,000	9.0	[1]44.4
Buildings	43,000	12.0	52,672	13.2	[1]18.4
Machinery, tools, and implements	82,000	22.9	87,443	23.0	[1]6.2
Cash and sundries	212,460	59.5	223,067	59.4	[1]4.8

[1] Decrease.

The table shows a decrease of 10.5 per cent in the total capital for the industry during the decade, and decreases in each item making up the total. The most marked decreases are shown in the items of land and buildings; machinery, tools, and implements, and cash on hand, bills receivable, etc., formed a greater proportion of the total capital in 1900 than in 1890, yet each of these items showed a decrease for the decade. This industry reported a considerable amount for machinery, tools, and implements, thus indicating that machinery is extensively used in the manufacture of the steel pen.

The cost of materials used in the manufacture of steel pens in 1900, and the cost of each item, with its proportion to the whole amount, are presented in Table 20.

TABLE 20.—PENS, STEEL: COST OF MATERIALS, 1900.

	Amount.	Per cent of total.
Total	$52,466	100.0
Principal materials[1]	50,237	95.8
Fuel	2,090	4.0
Rent of power and heat	139	0.2

[1] Includes items mill supplies and all other materials which are shown separately in Table 23.

Of the item "principal materials," $39,168 was for materials purchased in partially manufactured form, while $10,491 was for all other materials used in the manufacture. Steel and aluminum, and one or two other metals constituted all that was purchased in partially manufactured form.

Table 21 is a statement of the quantity and value of steel pens manufactured during the census year as reported by establishments engaged primarily in the manufacture of steel pens.

TABLE 21.—PENS, STEEL: QUANTITY AND VALUE OF PRODUCTS, 1900.

	Aggregate value.	PRODUCTS—PENS.				All other products, value.
		Total gross.	Total value.	Steel.		
				Gross.	Value.	
All establishments[1]	$294,340	1,075,780	$289,340	1,075,780	$289,340	$5,000

[1] Distributed as follows: New Jersey, 1; Ohio, 1; Pennsylvania, 1.

This table does not give statistics of the industry by states, separately, as the number of establishments in each is too small to permit such presentation without disclosing the operations of individual concerns. The establishments reporting for this industry for 1900 were then engaged exclusively in the manufacture of steel pens and did not report any subsidiary product of other pens or of pencils. The above table, however, does not show the total quantity and value of steel pens manufactured in this country during the census year, as some of the establishments, engaged primarily in manufacturing other articles, reported steel pens as a subsidiary product.

Table 22 shows the total quantity and value of steel pens produced during the census year as reported by establishments of any character.

TABLE 22.—PENS, STEEL: QUANTITY AND VALUE, 1900.

	Gross.	Value.
All establishments[1]	1,764,079	$411,872

[1] Distributed as follows: Connecticut, 1; New Jersey, 1; New York, 1; Ohio, 1; Pennsylvania, 1.

The totals shown in Table 22 do not agree with the totals elsewhere shown in this report or with those of the general report on this industry as presented in Manufactures, Parts I and II, for reasons previously mentioned.

HISTORICAL AND DESCRIPTIVE.

The real inventor of the steel pen is unknown. France, England, and the United States each have claimants for the honor, and it is difficult to decide to whom it belongs. Arnoux, a French mechanic, made metallic pens with side slits in 1750. Samuel Harrison, an Englishman, made a steel pen for Dr. Priestly in 1780. Peregrine Williamson, a native of New York, while engaged as a jeweler in Baltimore, made steel pens in that city in 1800. He met with signal success and produced a very good article.[1]

The first manufacture of steel pens by mechanical appliances was in England during the third decade of the Nineteenth century, and the names associated with it were John Mitchell, Joseph Gillott, and Josiah Mason, each doing something toward perfecting the processes of manufacture by mechanical means. At the period when these men commenced operations the pens in use were very crude specimens, made from a piece of steel formed into a tube, and filed into the shape of a pen, by hand, the joint of the two edges forming the slit. By degrees a press was contrived to do the cutting, bending, and marking; and machinery was devised for cleaning and polishing. Experiments were made with the object of securing the best possible quality of steel, and by the year 1860, when the manufacture of steel pens was first begun in this country, the article had been brought to a considerable degree of perfection.

The pens in use half a century ago were mostly fine pointed, and while they gave satisfaction in certain lines of penmanship, some objections were made to them for business and rapid writing. Since that time there has been a gradual improvement in the material used and the process of manufacture, and the fine-pointed pens have given away to some extent to the stub and other blunt-pointed pens.

The first steel pens made in the United States by mechanical appliances were made at New York in 1858 by Harrison & Bradford. Two years later a factory was started at Camden, New Jersey, by Richard Esterbrook, sr., Richard Esterbrook, jr., and James Bromgrove. This firm met with success, and in 1866 the establishment was incorporated as the Esterbrook Steel Pen Company. Their enterprise was successful, and the growth of the plant has continued up to the present time.[2]

The many prefixes, such as Peruvian, Damascus, Amalgam, and Silver, used to describe the pen, are but fancy names and do not indicate the quality of the article. The material used for all kinds is cast steel of the best quality, imported from England or Sweden.

[1] Scientific American, Nov. 28, 1878.

[2] One Hundred Years of American Commerce, Vol. II, page 660.

The best variety is that made from Swedish iron, which has in its granular structure a peculiar density and compactness. Steel for the manufacture of the pen has not yet been successfully produced in the United States.

The steel used in the industry is received in sheets varying in length, width, and thickness. These sheets are cut by the manufacturer into strips of convenient width, and are packed in an oblong iron box, which is placed with the open top downward in another box of the same material, the interstices being then filled up with a composition in order to exclude the air. The boxes are placed in a furnace, gradually heated until they are dull red in appearance, and then gradually cooled. In this process the strips become covered with bits of small scale. To remove this roughness they are immersed in a bath of diluted sulphuric acid, which loosens the scales, and they are then placed in wooden barrels containing water and broken pebbles. These barrels are revolved until the whole of the scaly substance is removed and the strips are of a silver-gray appearance. The strips are then taken to the rolling mill, where they are passed between successive rolls until reduced to the required gauge, the more common thickness being the one-hundred and sixtieth part of an inch. This operation requires considerable care and skill, as the variation of one-thousandth part of an inch in the thickness of the strip would seriously affect the flexibility of the pens. The strips are now three times their original length and have a bright surface.

In these preliminary processes the labor is performed by men and boys, but the processes of forming and shaping the pen, that begin at this point, are carried on by women and girls, who are more adapted to the work. The cutting of the blanks is accomplished by a die and a punch. This die is set in a bolster and is perforated by a hole the exact shape of the blank; and a punch, also of the exact shape of the blank, is attached to the bottom of the screw bolt of a press. The operator with her left hand introduces one of the strips of steel at the back of the press and pulls the handle toward her with the right hand. This causes the screw to descend, driving the punch into the bed, thus perforating the strip of steel with a scissor-like cut, and making a blank which falls through the opening in the die into a drawer below. The operator then pulls the strip of steel toward her until it is stopped by a little projection called a guide, and the operation just described is repeated, and again repeated, until the whole of one side of the strip is perforated, when the strip is reversed and the other side treated in a similar way. In the operation of cutting, a small V-shaped indentation is formed in the blanks upon the upper edge of that part inserted in the holder, which may be found upon a careful examination, and which plays an important part in the succeeding processes, as it enables the operator to distinguish between the smooth and rough sides of the blank.

The next process, called marking, is done by a stamp. The precise mark required is cut upon a piece of steel, which is placed in the hammer of the stamp. The stamp is operated by foot power. The operator takes a handful of blanks with her left hand, and by a dexterous motion makes a little train of them between the thumb and finger, presenting the first in the most ready position to be passed to the other hand. By the right hand the blank is placed, with the point toward the worker, in a guide upon the bed of the stamp, where the hammer falls upon it and makes the impression of the name cut upon the punch. So skillful do operators become in this process that they can stamp 200 to 250 gross of pens a day. Should the impression to be made be unusually large, the marking process is deferred until later in the course of construction.

The next process in the manufacture is "piercing," which produces the elasticity desired and causes the ink to attach itself to the pen. The tools used in this operation are very delicate and must be made with great precision. A piercing punch and bed are fixed in a screw press, and an ingenious arrangement of guides is fastened thereto. The operator then places the blank in its proper position and so manipulates the machinery as to cause the screw to descend, driving the punch into the bed. In order to soften the blanks, so that they can be properly shaped, they are put through a process called annealing. In this process the blanks are freed from the dust and grease that has become attached to them, and are then carefully placed in round iron pots, which are again inclosed in larger ones, covered over with charcoal dust to prevent the entrance of gases and put into the furnace, where they are heated to a dull red, and then gradually cooled.

After this process is finished the blanks are soft and pliable and readily assume the various shapes into which they are made by the next process, called "raising." In this operation a punch and die are again brought into use. The punch is fitted into a contrivance fixed in the bottom of the screw of the press; the die, or bed, is placed in a bolster, a cylindrical piece of steel attached to the bottom of the press, with a groove cut for the reception of the die. Four pieces of steel, called guides, are fixed to the bolster in such a position that the operator is enabled to slide the blank into the bed, where it is held by the guides until the punch descends, forcing the blank into the bed, and giving the pen its shape. The blanks are then placed in thin layers in round pans with lids and go through the process called "hardening." In this operation the pans mentioned are placed in the furnace for a period varying from twenty to thirty minutes, at the end of which time they have come to a bright red heat. The pans are then taken from the furnace and their contents thrown into a large bucket immersed in a tank of oil. This bucket is perforated, and when lifted from the tank the oil drains off. The pens are then placed in a perforated cylinder, which is set in motion and drains off the remainder of the oil. At this stage of the manufacture the pens are very greasy and as brittle as glass. To remove the grease adhering to them they are again placed in perforated buckets and immersed in a tank of boiling soda water.

The pens are then put into an iron cylinder, which is kept revolving over a charcoal fire until they are softened or tempered down to the degree required. This process is regulated according to the color shown by the pens, which indicates the varying temperature of the metal. After this operation the pens are black and rough at the point. To remedy these defects, the pens are subjected to the process known as "scouring," which consists in dipping the pens in a bath of diluted sulphuric acid, which removes all extraneous substances acquired in the hardening and tempering processes. Great care is exercised in this operation, as the acid is very likely to injure the steel. The pens are then placed in iron barrels with a quantity of water and a material composed of annealing pots broken and ground fine enough to pass through a fine riddle. The barrels are then set in motion, which is continued for a period varying from five to eight hours. At the end of this time they are placed in barrels with dry pot for about the same period, after which they are put into other barrels, together with a quantity of dry sawdust. They are then ground between the center pierce and the point. This is done by girls with the aid of a "bob," or "glazer," a circular piece of alder wood about 10½ inches in diameter and one-half an inch in width. Around this a piece of leather is stretched and dressed with emery. A spindle is driven through the center and the two ends placed in sockets. The mechanism thus arranged is set in motion by means of a leather band, and the operator, holding a pen firmly, grinds off, with a light touch, a portion of the surface.

The last and most important mechanical operation performed upon the pen is slitting. The tools used for this purpose are two oblong pieces of steel known as cutters, which are about 1½ inches long, three-eighths of an inch thick, and 1¼ inches wide. The edges of these cutters are equal in delicacy to the cutting edge of a razor. One of the cutters is fixed in a press with a pair of guides screwed on either side, and the other cutter is held by a bolster, having attached to it a small tool called a rest, or table. The operator places the pen upon the table, pushes the point up toward the guide, and, by operating the machine, makes the upper cutter descend and meet the lower one, thus slitting the pen.

At this stage in the process of manufacture the outer edge of each point is smooth, but the inside edges are sharp and rough. To remedy these defects the pens are again put in the iron barrels with pounded pot, and kept revolving for five or six hours, when they are removed and polished in sawdust. The pens are then colored by being placed in a copper or iron cylinder which revolves over a coke fire until the requisite tint is obtained. If the pens are to be lacquered they are placed in a solution of shellac dissolved in alcohol. This solution is afterwards drained off and the pens are placed in iron cylinders that are kept revolving until the pens are dry. The pens are then scattered upon iron trays and heated in an oven until the lacquer is diffused equally over the whole surface of the pens. The lacquer gives the pens a glossy appearance and prevents rust; and when the pens have cooled they are complete as far as manufacturing processes are concerned. Before they are offered to the public, however, they are given a very careful inspection, to see that no inferior ones are put on the market.

Table 23 presents a detailed statement of the statistics for the manufacture of steel pens, by states, 1900.

LEAD PENCILS.

The lead pencil industry was first reported separately at the census of 1860, as a subdivision of the general class of stationery. At the census of 1850 it was reported under the general classification of pens and pencils, when it was shown that there were four establishments engaged in the manufacture of pens and pencils, with a capital of $43,000 invested, employing 58 people at a cost of $14,028, and producing a product of $85,300. It is probable that the value of the products of the lead pencil industry was very small at that time, as it was only $20,400 in 1860. The growth of the lead pencil industry since 1860 has been constant, and in some periods remarkably great, as is shown by the statistics presented in the following tables.

Table 24 is a comparative summary of the statistics of the manufacture of lead pencils at the censuses of 1860 to 1900, inclusive, with the percentages of increase for each decade.

TABLE 24.—PENCILS, LEAD: COMPARATIVE SUMMARY, 1860 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

[1] Decrease.
[2] Includes proprietors and firm members with their salaries; number only reported in 1900, but not included in this table. (See Table 30.)
[3] Not reported separately.
[4] Not reported.

In 1860 the 6 establishments engaged in this industry reported a capital of $6,600 and products valued at $20,400. From 1860 to 1870 the growth of the industry was nothing less than remarkable. Although the number of establishments was increased by 2 only, the increase in capital was $254,550, and in products, $159,600. This rapid growth was probably due to the establishment in New York of branches of the leading factories in Germany, where the process of manufacture had attained a high degree of perfection.

During the next decade the number of establishments decreased one-half, while the capital invested and the value of the products showed gratifying gains, indicating that the larger plants remaining were successful in the manufacture of the article. Although the number of establishments increased but one from 1880 to 1890, the increase in the amount of capital invested exceeded that for any decade, and the increase in the value of the products was correspondingly large. In comparing the capital as reported at different censuses, however, it should be borne in mind that until the census of 1890, no definite attempt was made to include live capital in the returns. During the past decade there has been a marked decrease in the amount of capital invested, but an increase in number of establishments and in value of products. Women wage-earners predominate in this industry, and for each decade except 1870 to 1880 their number increased in greater proportion than that of the men wage-earners.

The number of establishments actively engaged in the manufacture of lead pencils in 1890 and in 1900, with the increase or decrease, by states, is presented in Table 25.

TABLE 25.—PENCILS, LEAD: NUMBER OF ESTABLISHMENTS, 1890 AND 1900.

STATES.	1900	1890	Increase.
United States	7	5	2
Illinois	1	....	1
Massachusetts	1	....	1
New Jersey	2	1	1
New York	3	3	....
Rhode Island	....	1	[1]1

[1] Decrease.

It appears from Table 25 that the number of establishments increased 2, or 40 per cent, during the decade. Illinois, Massachusetts, and New Jersey each show a gain of 1 establishment, while Rhode Island reported 1 establishment in 1890 and none in 1900. The center of the industry in 1900 was in New York and New Jersey, and but 2 establishments are reported outside of those states.

Table 26 is a comparative summary of the capital for 1890 and 1900, in its several subdivisions, with percentages of increase for the decade and the per cent each item is of the total.

TABLE 26.—PENCILS, LEAD: CAPITAL, 1890 AND 1900.

	1900		1890		Per cent of increase.
	Amount.	Per cent of total.	Amount.	Per cent of total.	
Total	$2,227,406	100.0	$3,100,836	100.0	[1]28.2
Land	151,800	6.8	270,000	8.7	[1]43.8
Buildings	253,500	11.4	373,000	12.0	[1]32.0
Machinery, tools, and implements	244,725	11.0	293,000	9.5	[1]16.5
Cash and sundries	1,577,381	70.8	2,164,836	69.8	[1]27.1

[1] Decrease.

The total amount of capital invested showed a large decrease for the decade. The different items making up the total also showed decreases of varying proportions. The most marked decrease in the items is shown in the value of lands owned by the establishments. The item of machinery represented a greater percentage of the total capital in 1900 than in 1890, and showed the smallest percentage of decrease of any item reported in Table 26. The items of buildings owned and cash on hand, bills receivable, etc., represented very nearly the same percentage of the total for the year 1890 as in 1900.

The cost of materials used in the manufacture of lead pencils and the proportion of each item to the total for 1900 is shown in Table 27.

TABLE 27.—PENCILS, LEAD: COST OF MATERIALS, 1900.

	Amount.	Per cent of total.
Total	$1,030,917	100.0
Principal materials	1,002,710	97.3
Purchased in raw state	79,233	7.7
Purchased in partially manufactured form[1]	923,477	89.6
Fuel	13,757	1.3
Rent of power and heat	....	....
Freight	14,450	1.4

[1] Includes mill supplies and all other materials, which are shown separately in Table 30.

The largest item shown in Table 27 is that reported for principal materials, which is divided into those purchased in raw state, that is, materials upon which no manufacturing force has been expended, and those purchased in a partially manufactured form. Of the amount shown for materials purchased in a raw state, the cost of cedar logs made up the greatest proportion. In the amount reported for materials purchased in a partially manufactured form are included cost of "mill supplies" and "all other materials," the former being $32,566 and the latter $255,587. Some establishments were unable to separate the amount paid for freight from the cost of materials, and reported the two together. For this reason the $14,450 does not represent the entire cost of freight, and should be considered only in connection with the cost of material. Nothing was reported under the item "rent of power and heat."

A detailed statement, by states, of the number of gross and the value of the different varieties of lead pencils, and the subsidiary products, of plants engaged primarily in this industry, is presented in Table 28.

All other states[1]											149,645

[1] Includes establishments distributed as follows: Illinois, 1; Massachusetts, 1; New Jersey, 2.

It appears from Table 28 that New York led in the output of lead pencils in the census year, producing almost twice as many gross as all other states combined. To show to a better advantage the different varieties of lead pencils manufactured during the census year, it was decided to subdivide the product according to the case in which the lead was inclosed. In doing this 5 divisions (wood, gold, silver, plated, and other varieties) were made. Practically, all lead pencils manufactured are inclosed in wooden cases, as will be seen from Table 28. A considerable overlapping of the pen and pencil industries is shown in this table. Table 28 gives only an incomplete enumeration of the quantity of lead pencils produced during the census year, for the reason that many lead pencils were reported as a subsidiary product of the industries engaged primarily in the manufacture of pens and other articles. The total quantity and value of lead pencils produced by establishments of any character is shown in Table 29.

Of the total quantity of lead pencils manufactured during the census year, those incased in wood were 1,653,973 gross, valued at $2,053,484, and all other varieties were but 6,881 gross, valued at $210,677. There were produced in all during the census year 1,660,854 gross, or 239,162,976 lead pencils—more than three for each man, woman, and child then living in the United States. The totals shown in Table 29 do not agree with the totals elsewhere given in this report, or with those in the general report on this industry as presented in Manufactures, Parts I and II.

TABLE 29.—PENCILS, LEAD: QUANTITY AND VALUE OF PRODUCTS, 1900.

[1] Includes establishments distributed as follows: Illinois, 1; Massachusetts, 1; New Jersey, 3, including 1 establishment which reported pencils as a by-product; Ohio, 1; Rhode Island, 2.

As the importations of pencils, "paper or wood filled with lead or other material, and pencils of lead," were but 85,119 gross, valued at $228,144, for the fiscal year ending June 30, 1900,[1] and as this was greatly in excess of the reports for the previous years, it will be seen that the American manufacturer practically supplies the home trade. It is to be regretted that no statistics are available as to the amount of lead pencils exported.

[1] Annual Report, United States Treasury Department, on Commerce and Navigation of the United States for 1900.

HISTORICAL AND DESCRIPTIVE.

The manufacture of lead pencils is a comparatively modern industry in the United States, dating from 1861, when the Fabers, pencil manufacturers in Germany, established a branch factory in New York. The use, however, of metallic lead for marking is very old. Pliny refers to lead as used for marking lines on papyrus; La Moine cites a document of 1387 ruled with it; Cortez found the Aztecs, in 1520, using crayons made of it.[1] The manufacture of lead into pencils, however, was not very general until after the discovery of the famous Barrowdale graphite mine in Cumberland, England, in 1564. The material from this mine was so highly desired and was so closely maintained as a monopoly that, in pursuance of an act of Parliament, the mouth of the mine was guarded by an armed force. To keep up the monopoly, the mine was worked only six weeks in a year, and its mouth was closed by flooding with water after the workmen left. The process of preparing the graphite mined here was the simple one of dividing it into slips. The most general method used to accomplish this purpose was that of compressing pulverized graphite with hydraulic presses into solid blocks, and then sawing it into bars. About 1850 the Barrowdale mines became exhausted, and since that time the lead for pencils has been prepared by a process invented by Conté, of Paris, at the close of the last century, or some adaptation of that process. Briefly, his method was to powder the graphite ore and mix it with a powdered clay. These materials, mixed in varying proportions, constitute the marking portion of the modern lead pencil. The grades of hardness and softness are secured by using more graphite and less clay to produce the softer grades, and more clay and less graphite for the harder grades. While Conté, a Frenchman, originated this process, it was left to the Germans to perfect it, which they accomplished so completely during the first part of the past century, that Germany can well be called the home of the modern graphite pencil.

Graphite or plumbago, the material now universally used for true surface writing, has been known for more than five hundred years. This material resembles lead no more than chalk does. Graphite is a nearly pure form of carbon and has many peculiar qualities. It is only one-fourth as heavy as lead; can not be fused; is one of the softest minerals dug from the earth; and if subjected to a very hot fire it will not melt nor be consumed, but it will gradually waste. This substance is found in its purest form at Ticonderoga, N. Y. The variety mined at this place contains 99.9 per cent carbon, while the best quality taken from the Ceylon mines is 99 per cent, and that found in the Barrowdale mine in England had but 87 per cent carbon. The inferior grades of graphite contain from 50 to 60 per cent of foreign matter. For the manufacture of pencils only the finer grades of graphite are used. In addition to the places mentioned, graphite is mined in Siberia, where an excellent quality is found; at Harnon, Sweden; at Passau, Bavaria; at Schwarzback, Germany; in the province of Nelson, New Zealand; and in Mexico. In the United States, impure grades are found at Raleigh and Asheville, N. C., and at Cumberland Hill and Cranston, R. I.[2] The clay used to mix with the graphite is a peculiar kind of pipe clay imported from Germany and Holland. The wood chiefly used for the holders is soft, straight-grained, red cedar, found in Florida, Georgia, Alabama, Mississippi, and Texas, and is used not only by American manufacturers but by all the pencil makers of the world.

Prior to the coming of the Fabers to the United States lead pencils were manufactured here, but to a very limited extent. The first step in starting the industry was made by William Monroe, of Concord, Mass., in 1812. At the commencement of the War of 1812 he was engaged as a cabinetmaker, but the nonintercourse, nonimportation, and embargo acts had so depressed business generally that he turned his attention to the making of pencils. The price for them was exceedingly high, owing to their scarcity, and success in making them meant large rewards. He procured a few lumps of black lead, pulverized them with a hammer, and separated the finer portions by suspension in a tumbler full of water. From the material thus prepared he made his first experimental mixture in a spoon, and out of it attempted to make a pencil. The result was so discouraging that he returned to his old occupation of making cabinets. He managed, however, to devote some time each day to his experiments, and after four months' work in this way he secured a better lead, which he incased in cedar-wood holders, thus producing the first American-made pencils. On the 2d day of July, 1812, he proceeded to Boston with a modest sample of about 30 pencils, which found a ready sale. The purchaser encouraged him to continue the manufacture. On his next trip to Boston he took with him 3 gross. The dealer then made a contract with him for all the pencils he could make within a certain time, at a certain price. All the mixing of the lead and putting it into pencils was done entirely by his own hands in a small room of his dwelling, thoroughly protected from curious eyes, no one but his wife being permitted to know anything of his methods. He continued his pencil manufacture for about eighteen months, when he was compelled to abandon it, owing to the difficulty of obtaining raw materials. At the close of the war he resumed the manufacture, but the imported article was found superior, and he made but little progress in the

[1] Knight's Mechanical Dictionary.

[2] The Universal Cyclopædia, vol. 5, page 250.

business. Until 1819 he carried on the manufacture as a subsidiary occupation with his cabinetmaking, but in that year, having met with better results, he devoted himself exclusively to the manufacture of lead pencils. After ten years of persistence and study directed toward the improvement of the quality of the pencils, his make grew into favor and supplied a part of the home demand.

It is said on reliable authority that Joseph Dixon attempted the manufacture of lead pencils at Salem, Mass., as early as 1830. Mr. Dixon's first consignment to a Boston firm was not enthusiastically received, but he was told that if he would place a foreign label on the pencils they would meet with ready sale. Rather than do this he had the pencils returned, and never again manufactured any. He gave his attention after that time to the manufacture of crucibles, and formed what is known as the Joseph Dixon Crucible Company. This firm began the manufacture of lead pencils in 1872, and met with exceptional success.

Prior to the manufacture of pencils by the Dixon company, 3 establishments of foreign origin were in operation in the United States. First, came representatives of the Faber plant in Germany, who began the manufacture of lead pencils in 1861. Next, in 1865, the Eagle Pencil Company was established in a similar way, and in the same year and in the same manner the American Lead Pencil Company was established. The above-named companies are now managed and owned by American citizens and have no connection with foreign plants.

After the industry had been established in the United States in the manner described, its progress and growth were very rapid. This was due mainly to the following causes: The existence in the United States of very rich graphite mines; the extraordinary facilities for securing this substance from mines elsewhere; the presence here of the greatest cedar forests of the world; and the introduction of labor-saving machines.

The process employed to-day in the manufacture of the American lead pencil is the Conté system, but the article produced by it has been so infinitely improved in workmanship and detail beyond the original product, that it would seem as if the pencil had almost reached its limit of perfection. As now followed, the process is a difficult, painstaking, and most elaborate one, and there is needed in the manufacture both a practical and theoretical knowledge of its chemistry and mechanics.

The raw material (graphite) used in many American-made lead pencils is mined at Ticonderoga, N. Y. This mine closely resembles an anthracite coal mine both in external and internal appearance. In it there are two formations of the graphite—a large vein of the crystallized variety, and the compact or granulated form of deposit, the latter being the only one used in pencils. This latter kind is found in small veins, or in what miners call "pockets." The graphite is taken, in the lump, direct from the mouth of the mine to the reducing mill, where it is pulverized by stamps under water, the particles floating off with the water through a series of tanks, in which they sink to the bottom, forming a sediment. The water being drained off and the sediment dried, the graphite is finally sent to the factory in barrels in the form of an impalpable powder—lusterless and of a dingy color. At this stage the graphite is finer and softer than flour, and is as evasive to the touch as quicksilver.

The particles are then separated further, according to fineness, by a process known as "floating." To effect this separation the graphite is mixed with sufficient water to run very freely, and then turned into a hopper from which the water runs slowly through a series of tubs so arranged that the top portion of each tub drains off into the tub placed next to it, but on a lower plane than the first. In this manner the coarsest and heaviest particles settle to the bottom of the first tub, the next coarsest and heaviest in the next, and so on, the movement of the water being made very gentle. On reaching the last tub, the powder, being twice as heavy as water, sinks in it, if undisturbed, and so far settles that the water discharges at the top nearly clear. When the flow is stopped and the powder has settled, the clear water is withdrawn by removing successively, beginning with the upper one, a number of plugs inserted in holes in the side of each tub, care being taken not to agitate the contents so as to disturb the deposited dust. The deposits are then removed through gates at the bottom of each tub. The deposit in the last tub is used for the finest grade of pencils, and those in the other tubs for the coarser grades.

The graphite is now ready for the clay, which is of a bluish-gray color, of great strength, and of a fatty appearance when wet. This clay is subjected to the floating process in the same way as the graphite, only the finest being used for mixing with the graphite in proportions varying according to the degree of hardness required. The more clay used, the harder the pencil; but for the medium grade the proportions are about seven parts of clay to ten of graphite, by weight. The graphite and clay are then mixed together with water to the consistency of thick cream, and the mixture is fed to the grinding mills, which consist of two flat stones about two feet in diameter, placed horizontally, only the upper one being in motion. The mass is ground between these stones many times in order to secure the most perfect strength, uniformity, and freedom from grit in the leads. The mass, when ground, is inclosed in stout canvas bags, and the clear water forced out of it by hydraulic pressure until it becomes a thick dough, when it is sent to a forming press. This is a small, vertical, iron cylinder, having a solid plunger or piston, driven by a screw. A plate is inserted in the bottom having an opening of the shape and size of the lead desired, and through this hole the lead is forced something as a stream of water is forced from a syringe and coils itself round and round, like a coil of wire on a board set beneath the press. The coil is taken up, straightened, and broken off into lengths sufficient for 3 leads, which are then laid in order on a board, pressed flat by having a cover put over them, placed in a crucible, and baked in a kiln.

The material is now ready for the wooden cases, for which, in the cheaper pencils, pine is used, and in the better grades, cedar. At the sawmills the wood is cut into blocks about 7 inches long, and these are sawed into strips about 3½ inches wide and three-sixteenths of an inch thick. Each of these strips is sufficient to make the halves of 6 pencils. As the pencils are made six at a time, imperfect strips are put together so as to make a full strip out of the parts. These are packed closely in boxes and shipped to the factory. When they reach the factory they are passed in a continuous line under a cutter, which smooths their faces and cuts 6 little grooves—round or square—for the leads at the same stroke. The putting in of the leads is done by three operators. The first places the lead in the grooves and passes it to a second, who receives another strip with the grooves and surface coated with glue from the third operator, and puts them together. The united pairs are laid in rows, pressed together by a screw, and left to dry. The rough ends of the strips and the projecting leads are then ground smooth against a wheel covered with sandpaper. Next, the slips are fed one by one under a revolving cutter, which separates each into 6 rough pencil forms, and rounds these on one side by cutting away the superfluous wood. As they come from under the cutter they are turned over and passed under a second one, which rounds them on the other side, so that they fall in a continuous stream of finished pencils.

The planing machine in this process uses revolving knives, which make a succession of little gouges in the wood. These gouges, which would otherwise leave the surface very irregular, leave it smooth by following one another so closely that they become one long cut. So perfect is the operation of these revolving cutters, which make 9,000 strokes upon the wood a minute, that they leave the surface not only "true," but so smooth that the finest sandpaper would scratch it. The pencils are then counted, a gross at a time, by an operator, who simply arranges them by the handful in grooves, each large enough to contain 1 pencil. If the pencils are to be colored, they are immersed in dye and then sent to the varnishing machines. Here they are fed into a little hopper, from which they settle through sidewise and are seized between two wheels, which thrust them endwise, one at a time, through a hole in a tube wherein they are varnished. Each pencil, pushed on by its follower in the single-file movement, emerges from the tube and drops on a horizontal belt. It then moves slowly with the belt some 30 feet, drying as it goes, when the belt, reaching a pulley, releases the pencil and it drops into a receptacle. Pencils are varnished in this machine at the rate of 100 a minute. The other operations are of minor consequence, consisting in shaving a little from the end, sharpening certain styles on a wheel, stamping, and packing. Except for the lead makers and a few attendants, the labor is done by women, the machines being automatic, so that little strength and skill is necessary. The work is singularly cleanly and in no respect unhealthy, and the factory is peculiar in being permeated by the aromatic odor of the red cedar.

Table 30 presents in detail the statistics for the manufacture of lead pencils, by states, 1900.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 213. WASHINGTON, D. C. June 27, 1902.

AGRICULTURE.

ILLINOIS.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture in the state of Illinois, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It also includes the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of Illinois, June 1, 1900, numbered 264,151, and were valued at $1,765,581,550, of which amount $251,467,580, or 14.2 per cent, represents the value of buildings, and $1,514,113,970, or 85.8 per cent, the value of the land and improvements other than buildings. On the same date the value of farm implements and machinery was $44,977,310, and of live stock, $193,758,037. These values, added to that of farms, give $2,004,316,897, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of all such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $345,649,611, of which amount $130,816,905, or 37.8 per cent, represents the value of animal products, and $214,832,706, or 62.2 per cent, the value of crops, including forest products cut or produced on farms. The total value of farm products for 1899 exceeds that for 1889 by $160,890,598, or 87.1 per cent. A part of this increase is doubtless due to a more detailed enumeration in 1900 than in 1890.

The "gross farm income" is obtained by deducting the value of the products fed to live stock on the farms of the producers from the total value of farm products. In 1899 the reported value of products fed was $81,897,180, leaving $263,752,431 as the "gross farm income." The ratio which this latter amount bears to the "total value of farm property" is referred to in the text as the "percentage of gross income upon investment." For Illinois, in 1899, it was 13.2 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Illinois.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.

AGRICULTURE IN ILLINOIS.

GENERAL STATISTICS.

Illinois has a total land area of 56,000 square miles, or 35,840,000 acres, of which 32,794,728 acres, or 91.5 per cent, are included in farms.

Illinois is one of the most level states in the Union, with water courses flowing generally from the north and northeast to the southwest and south. In portions of the south and southwest the surface is slightly rough and broken, as it is also in the northwest in which is found the highest elevation.

The soil consists of a rich, black loam or mold, underlaid by drift deposits from 25 to 100 feet deep in places. This, with a favorable climate, makes Illinois one of the leading agricultural states in the Union.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1850, the number of farms, the total and average acreage, and the per cent of farm land improved.

Table 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	264,151	32,794,728	27,699,219	5,095,509	124.2	84.5
1890	240,681	30,498,277	25,669,060	4,829,217	126.7	84.2
1880	255,741	31,673,645	26,115,154	5,558,491	123.9	82.4
1870	202,803	25,882,861	19,329,952	6,552,909	127.6	74.7
1860	143,310	20,911,989	13,096,374	7,815,615	145.9	62.6
1850	76,208	12,037,412	5,039,545	6,997,867	158.0	41.9

Since 1850 both the number of farms and the total farm acreage have increased rapidly, the rates of gain in the last decade being 9.8 per cent and 7.5 per cent, respectively. The greater rapidity of the gain in the total number of farms has resulted, in each decade except from 1880 to 1890, in a decrease in the average size of farms. A gain in the percentage of farm land improved is shown for each decade. That the increase shown for the last decade is comparatively small is due, in part, to the use of a more strict construction of the term "improved land" in 1900 than in previous census years.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

Table 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF FARM PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$2,004,316,897	$1,765,581,550	$44,977,310	$193,758,037	$345,649,611
1890	1,477,759,187	1,262,870,587	34,456,938	180,431,662	184,759,013
1880	1,175,772,293	1,009,594,580	33,739,951	132,437,762	203,980,137
1870[2]	1,104,839,631	920,506,346	34,576,587	149,756,698	[3] 210,860,585
1860	498,680,730	408,944,033	17,235,472	72,501,225	
1850	126,748,109	96,133,290	6,405,561	24,209,258	

[1] For year preceding that designated.

[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years, they must be diminished one-fifth.

[3] Includes betterments and additions to live stock.

Between 1850 and 1900, the total value of farm property increased very rapidly, the increase in the last decade amounting to $526,557,710, or 35.6 per cent. Since 1890 the value of farms has increased $502,710,963, or 39.8 per cent; that of live stock, $13,326,375, or 7.4 per cent; and that of implements and machinery, $10,520,372, or 30.5 per cent. The value of farm products for 1899 exceeds that reported for 1889 by $160,890,598, or 87.1 per cent, but a portion of this increase, and of that noted in the case of implements and machinery, is doubtless the result of a more detailed enumeration in 1900 than in previous census years.

COUNTY STATISTICS.

Table 3 gives an exhibit of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.

In the majority of counties the number of farms increased in the last decade, but ten counties, most of which are situated in the central part of the state, reported decreases. Only three counties, Kankakee, Sangamon, and Warren, report decreases in total farm area. The remaining counties show considerable increases. The decrease reported in improved acreage in some of the counties is due to a more intensive cultivation of the soil, and to the use of a more strict construction of the term "improved" by the Twelfth than by any preceding census. The average size of farms for the state is 124.2 acres. As a rule, the northwestern counties have the largest farms while smaller averages are shown for the southern counties.

All counties but one report large increases since 1890 in the total value of farms. For the state, the average value is $6,684 per farm. Implements and machinery decreased in value in Cass, Clinton, and Putnam counties. More than four-fifths of the counties show an increase in the value of live stock, but a few of the central counties report decreases.

FARM TENURE.

Table 4 gives a comparative exhibit of farm tenure for 1880, 1890, and 1900. The farms operated by tenants are divided into two groups designated as farms operated by "cash tenants" and "share tenants." The groups comprise, respectively: (1) Farms operated by individuals who pay a rental in cash or a stated amount of labor or farm produce, and (2) farms operated by individuals who pay as rental a stated share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer, and the farms operated by owners are subdivided into four groups, designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other, or others, owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	264,151	160,453	38,173	65,525	60.7	14.5	24.8
1890	240,681	158,848	29,182	52,651	66.0	12.1	21.9
1880	255,741	175,497	20,620	59,624	68.6	8.1	23.3

[1] Including "part owners," "owners and tenants," and "managers."

TABLE 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	264,151	121,715	34,375	2,413	1,950	38,173	65,525
White	262,662	121,172	34,203	2,401	1,945	37,956	64,985
Colored[1]	1,489	543	172	12	5	217	540

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	46.1	13.1	0.9	0.7	14.4	24.8
White	100.0	46.1	13.0	0.9	0.7	14.5	24.8
Colored[1]	100.0	36.5	11.5	0.8	0.3	14.6	36.3

[1] Comprising 3 Chinese and 1,486 negroes.

The percentages in Table 4 show that the number of farms operated by owners has not increased so rapidly in the last twenty years as the number operated by tenants. Between 1890 and 1900 the total number of farms increased 23,470, or 9.8 per cent; the number operated by owners increased 1,605, or 1.0 per cent; cash-tenant farms, 8,991, or 30.8 per cent; and share-tenant farms, 12,874, or 24.5 per cent. In 1890, 64.3 per cent of all tenants were share tenants, and in 1900, 63.2 per cent were share tenants.

Of the white farmers, 60.1 per cent own all or a part of the land they operate, and 39.9 per cent operate farms owned by others. The corresponding percentages for colored farmers are 48.8 and 51.2. The greatest relative numbers of cash tenants are in counties near Chicago and other cities where land is very valuable and usually cultivated in small tracts.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," and "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	264,151	124.2	32,794,728	100.0	$2,004,316,897	100.0
White farmers	262,662	124.5	32,711,516	99.7	2,000,987,066	99.8
Colored farmers[1]	1,489	55.9	83,212	0.3	3,329,831	0.2

Share tenants	5,605	707	153	583	940	13.3

[1] Comprising 3 Chinese and 1,486 negroes.

Of the farms of the state, 99.4 per cent are operated by white farmers and 0.6 per cent by colored farmers. The average size of the farms of colored farmers is less than half that of farms of white farmers, and the average value of all forms of their farm property and products is approximately one-third as great. The slightly higher percentage of gross income shown for colored farmers is in keeping with the small average size of their farms, a factor which naturally involves more intensive cultivation than is practiced by the operators of the larger farms. This view is sustained by the percentages given in Table 9, which show a decrease in gross income as the size of farms increases.

The farms of managers, though fewest in number, have the largest average area, and the highest average value, but as the values are high, the per cent of gross income is lowest for this group. The averages are generally lower for owners and share tenants.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	264,151	124.2	32,794,728	100.0	$2,004,316,897	100.0
Under 3 acres	1,854	2.0	3,771	(1)	4,365,763	0.2
3 to 9 acres	7,221	6.3	45,167	0.1	13,768,612	0.7
10 to 19 acres	10,560	13.8	145,417	0.5	22,255,942	1.1
20 to 49 acres	41,160	34.8	1,431,732	4.4	87,488,216	4.4

500 to 999 acres	2,051	613.4	1,258,084	3.8	69,227,656	3.4
1,000 acres and over	282	1,362.5	384,230	1.2	17,131,251	0.8

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The State	$5,732	$952	$170	$734	$999	13.2
Under 3 acres	1,154	1,020	70	111	568	24.1
3 to 9 acres	1,089	639	52	127	288	15.1
10 to 19 acres	1,382	503	58	165	292	13.8
20 to 49 acres	1,423	400	68	235	342	16.1
50 to 99 acres	3,132	655	122	431	621	14.3
100 to 174 acres	6,312	1,047	196	767	1,107	13.3
175 to 259 acres	10,123	1,452	269	1,214	1,675	12.8
260 to 499 acres	15,564	1,959	351	1,997	2,372	11.9
500 to 999 acres	26,144	3,056	467	4,086	3,836	11.4
1,000 acres and over	47,315	4,447	570	8,417	6,195	10.2

The group of farms containing 100 to 174 acres each, contains the largest number of farms, and comprises more than one-third of the value of all farm property and of the total farm acreage.

For the group of farms containing less than 3 acres each, the average values given in Table 9 are relatively high, as this group contains most of the florists' establishments of the state, and a number of city dairies and vegetable farms. It should be borne in mind that the income from these industries is determined not so much by the acreage of land used, as by the amount of capital invested in buildings, live stock, and implements, and by the amounts expended for labor and fertilizers.

The average gross incomes per acre for the various groups classified by area are as follows: Farms under 3 acres, $279.20; 3 to 9 acres, $46.01; 10 to 19 acres, $21.16; 20 to 49 acres, $9.83; 50 to 99 acres, $8.22; 100 to 174 acres, $8.14; 175 to 259 acres, $7.93; 260 to 499 acres, $7.26; 500 to 999 acres, $6.25; 1,000 acres and over, $4.55.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop, and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm. If vegetables are the leading crop, constituting 40 per cent of the value of the products not fed to live stock, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive their principal income from any one class of farm products. Farms for which no income was reported are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS. Average.	Total.	Per cent.	VALUE OF FARM PROPERTY. Total.	Per cent.
The State	264,151	124.2	32,794,728	100.0	$2,004,316,897	100.0
Hay and grain	107,020	143.1	15,315,711	46.7	991,851,452	49.5
Vegetables	6,656	40.4	268,846	0.8	43,997,057	2.2
Fruits	2,411	59.1	142,458	0.4	8,970,369	0.5
Live stock	113,674	120.3	13,673,753	41.7	744,327,774	37.1
Dairy produce	15,602	107.2	1,673,279	5.1	129,402,044	6.5
Tobacco	138	86.3	11,904	0.1	589,222	(1)
Sugar	60	84.9	5,096	(1)	428,329	(1)
Flowers and plants	499	4.0	1,992	(1)	4,648,056	0.2
Nursery products	126	61.6	7,760	(1)	1,743,586	0.1
Miscellaneous	17,965	94.3	1,693,929	5.2	78,359,008	3.9

[1] Less than one-tenth of 1 per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The State	$5,732	$952	$170	$734	$999	13.2
Hay and grain	7,442	961	197	668	1,187	12.8
Vegetables	5,455	837	109	209	766	11.6
Fruits	2,512	838	107	264	659	17.7
Live stock	4,598	936	153	861	879	13.4
Dairy produce	5,822	1,325	202	945	1,056	12.7
Tobacco	3,036	674	109	451	639	15.0
Sugar	5,687	853	190	409	956	13.4
Flowers and plants	4,888	4,202	182	43	3,739	40.1
Nursery products	11,446	1,982	234	176	4,741	34.3
Miscellaneous	3,182	636	124	420	608	14.0

For the several classes of farms the average values per acre of products not fed to live stock are as follows: For farms deriving their principal income from flowers and plants, $936.61; nursery products, $76.98; vegetables, $18.98; sugar, $11.26; fruits, $11.15; dairy produce, $9.84; hay and grain, $8.29; tobacco, $7.41; live stock, $7.31; and miscellaneous, $6.46. In computing these averages, the total area of the farms of each group is used, and not merely the acreage devoted to the crop from which the principal income is derived.

The wide variations shown in the averages and in the percentages of gross income are due, largely, to the fact that in computing gross income no deduction is made for expenses involved in operation. For florists' establishments, nurseries, and market gardens, the average expenditure for such items as labor and fertilizers represents a far larger percentage of the gross income than for "hay and grain," "live-stock," or "miscellaneous" farms.

Were it possible to present the average net income the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.

TABLE 13.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$5, 732	$952	$170	$734	$999	13.2
$0	2, 622	368	61	349		
$1 to $49	1, 161	271	32	136	35	2.2
$50 to $99	1, 013	281	39	136	75	5.1
$100 to $249	1, 290	351	53	210	174	9.1
$250 to $499	2, 225	521	92	347	369	11.6
$500 to $999	4, 442	848	152	590	722	12.0
$1,000 to $2,499	9, 087	1, 378	252	1, 064	1, 551	13.2
$2,500 and over	17, 667	2, 327	419	2, 342	3, 669	16.1

The absence of income in the first group is due in part to the fact that the enumerators could not always secure complete reports for farms where changes in ownership or tenancy had occurred shortly prior to the date of enumeration. The persons in charge of such farms, on June 1, 1900, could not always give definite information concerning the products of the preceding year. The same statement is true, also, of some of the farms with reported incomes of less than $100. To this extent the reports fall short of giving a complete exhibit of farm income in 1899. Other farms with small reported incomes are doubtless the suburban or summer homes of city merchants and professional men who derive their principal income from other than agricultural pursuits.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the Twelfth Census. The age grouping for neat cattle was determined in accordance with their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with previous census reports.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	723, 322	$7, 195, 897	$9. 95	10, 220
Steers	1 and under 2	364, 103	8, 251, 444	22. 66	2, 279

Mules	1 and under 2	13, 194	585, 666	44. 39	139
Mules	2 and over	97, 646	6, 433, 775	65. 89	6, 216
Asses and burros	All ages	2, 529	223, 147	88. 24	429
Lambs	Under 1	401, 431	989, 897	2. 47	10, 536
Sheep (ewes)	1 and over	548, 853	2, 341, 230	4. 27	29, 048
Sheep (rams and wethers).	1 and over	80, 297	375, 515	4. 68	15, 307
Swine	All ages	5, 915, 468	23, 616, 781	3. 99	166, 944
Goats	All ages	8, 877	19, 932	2. 25	2, 984
Fowls:[1]					
Chickens[2]		16, 600, 728	6, 415, 033		
Turkeys		446, 020			
Geese		307, 657			
Ducks		382, 857			
Bees (swarms of)		179, 953	486, 164	2. 70	
Unclassified			820		
Value of all live stock			193, 758, 037		

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including Guinea fowls.

The value of all live stock on farms, June 1, 1900, was $193,758,037. Of this amount, 36.0 per cent represents the value of horses; 24.7 per cent, that of neat cattle other than dairy cows; 17.7 per cent, that of dairy cows; 12.2 per cent, that of swine; 3.8 per cent, that of mules; 3.3 per cent, that of poultry; 1.9 per cent, that of sheep; and 0.4 per cent, that of all other live stock.

No reports were secured of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, however, the value of live stock not on farms was $18,938,334, about 10 per cent as great as the value of live stock on farms. The value of all live stock in the state, exclusive of poultry and bees not on farms, was, approximately, $212,696,371.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the changes since 1850 in the numbers of the most important domestic animals.

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1850 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	1,007,664	2,096,346	1,350,219	127,173	629,150	5,915,468
1890	1,087,886	1,975,233	1,335,289	107,875	922,631	5,924,818
1880	865,913	1,518,409	1,023,082	123,278	1,037,073	5,170,266
1870	640,321	1,075,265	853,738	85,075	1,568,286	2,703,343
1860	522,634	1,061,179	563,736	38,539	769,135	2,502,308
1850	294,671	617,365	267,653	10,573	894,043	1,915,907

[1] Lambs not included.

All classes of live stock, except sheep, show great increases in number since 1850. The number of sheep has fluctuated, reaching the maximum in 1870. Since that time the decrease has been rapid, amounting to 31.8 per cent in the ten years between 1890 and 1900.

An increase in the number of dairy cows is shown for each decade until the last, but the census of 1900 shows a decrease of 7.4 per cent. The increased production of milk in the last decade, however, leads to the belief that the decrease in the number of cows is merely apparent, owing to a difference in the methods of enumeration used in 1890 and 1900. In the latter year, many cows, milked at some time in the year, but not "kept for milk" primarily, were classed with "cows and heifers not kept for milk," and consequently with "other neat cattle." The numbers of other neat cattle and horses have increased steadily since 1850. The rates of gain since 1890 were 6.1 per cent and 1.1 per cent, respectively. The number of mules and asses increased every decade, except from 1880 to 1890. For the last decade the increase was 17.9 per cent. A decrease of 0.2 per cent in number of swine is also shown for the last decade, the only decrease for that class of stock since 1850.

The prevailing high prices just previous to the enumeration, caused farmers to reduce their flocks and herds greatly, as is shown by the fact that for 1899 more than half the total value of animal products was derived from the sale of live animals on farms, and the value of animals sold in 1899 was one-third as great as that of all live stock remaining on farms, June 1, 1900.

In 1900 the enumerators were directed to report no fowls under three months old, but no such instruction was given in former census years. This accounts, in part at least, for the following decreases in numbers of all classes of domestic fowls between 1890 and 1900: Geese, 57.6 per cent; turkeys, 57.3 per cent; ducks, 48.0 per cent; and chickens, 22.7 per cent. The increased production of eggs for the same time clearly indicates that the decrease in numbers of fowls is only apparent.

ANIMAL PRODUCTS.

Table 16 is a summarized exhibit of the animal products of 1899.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	4,799,742	$966,746
Mohair and goat hair	Pounds	2,793	751
Milk	Gallons	[1]457,106,995	
Butter	Pounds	52,493,450	[2]29,638,619
Cheese	Pounds	323,485	
Eggs	Dozens	86,402,670	8,942,401
Poultry			11,307,599
Honey	Pounds	2,961,080	343,200
Wax	Pounds	75,290	
Animals sold			69,462,993
Animals slaughtered			10,154,596
Total			130,816,905

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of milk sold and consumed, and of butter and cheese made.

The value of the animal products for 1899 was $130,816,905, or 37.8 per cent of the value of all farm products and 49.6 per cent of the gross farm income. This value was also two-thirds as great as that of all live stock on farms, June 1, 1900. Of the total amount, 60.9 per cent represents the value of animals sold and animals slaughtered on farms; 22.6 per cent, that of dairy products; 15.5 per cent, that of poultry and eggs; 0.7 per cent, that of wool, mohair, and goat hair; and 0.3 per cent, that of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms, $79,617,589, is 23.0 per cent of all farm products and 30.2 per cent of the gross farm income. Of all farmers in the state, 214,094, or 81.0 per cent, report animals slaughtered on farms, the average value per farm being $47.43. Sales of live animals are reported by 198,944 farmers, or 75.3 per cent of the whole number, the average receipts per farm being $349.16. McLean county was first in amount of sales, reporting $1,997,978 from 3,957 farms, an average of $504.92 per farm. Twenty-eight counties in the state each reported more than a million dollars received from sales of live animals.

DAIRY PRODUCE.

In 1899 the proprietors of 15,602 farms, or 5.9 per cent of all in the state, derived their principal income from the sale of dairy produce, the total value of which constituted 22.7 per cent of that of all animal products. The production of milk in 1899 was 89,837,531 gallons greater than in 1889, a gain of 24.5 per cent. McHenry, Kane, Cook, Lake, and Du Page counties were first in the production of milk, ranking in the order named.

Of the $29,638,619, given in Table 16 as the value of dairy produce, $19,067,797, or 64.3 per cent, represents the value of the portion sold, and $10,570,822, or 35.7 per cent, the value of that consumed on farms. Of the former amount, $14,477,813 was received from the sale of 186,549,335 gallons of milk; $4,306,553, from 26,395,166 pounds of butter; $258,581, from 560,532 gallons of cream; and $24,850, from 263,237 pounds of cheese.

Since 1889 the amount of butter produced on farms has decreased 8.1 per cent, and that of cheese produced on farms, 5.8 per cent. These changes are due, in part, to the transfer of butter and cheese making from the farm to the creamery, and in part to the increasing quantities of milk and cream consumed in cities.

POULTRY AND EGGS.

The value of the products of the poultry industry in 1899 was $20,250,000. Of this amount, 55.8 per cent represents the value of poultry raised, and 44.2 per cent, that of eggs produced. The production of eggs for 1899 was 26,051,605 dozens greater than in 1889, a gain of 43.2 per cent. Shelby, Cook, and Lasalle counties were first in the production of eggs in 1899, while 30 counties reported more than a million dozens each.

WOOL.

The production of wool for 1899 was 4,799,742 pounds, an increase of 6.9 per cent since 1889. This increase is more apparent than real, owing to the fact that the fleeces of at least 273,237 sheep were omitted from the tables in 1890, but included in a general estimate of wool shorn after the census enumeration. One-fourth of the state total was reported by the nine following counties which rank in the order named: De Kalb, Macoupin, Pike, McLean, Vermilion, Jo Daviess, Crawford, Shelby, and Wayne.

HONEY AND WAX.

For 1899 there was a decrease of 35.7 per cent in the amount of honey produced and an increase of 49.3 per cent in the amount of wax, compared with the production of 1889. Honey and wax were reported, in 1899, from 34,932 farms.

HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses and dairy cows, the total number of these animals, and the average number per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm.
Total	246,614	1,350,219	5.5	230,625	1,007,664	4.4
White farmers	245,461	1,347,090	5.5	229,854	1,006,236	4.4

[1] Including "part owners" and "owners and tenants."
[2] Including florists' establishments and nurseries.

CROPS.

The following table gives the statistics of the principal crops grown in 1899.

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES, OF PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantities.	Value.
Corn	10,266,335	Bushels	398,149,140	$115,092,567
Wheat	1,826,143	Bushels	19,795,500	11,937,458
Oats	4,570,034	Bushels	180,305,630	36,990,019
Barley	21,375	Bushels	686,580	242,834
Rye	78,869	Bushels	1,104,670	509,688
Buckwheat	6,220	Bushels	65,050	36,225
Flaxseed	394	Bushels	4,336	4,705
Kafir corn	34	Bushels	808	312
Clover seed		Bushels	97,544	376,262
Grass seed		Bushels	455,161	274,201
Hay and forage	3,343,910	Tons	4,256,211	25,569,169
Tobacco	2,242	Pounds	1,447,150	85,411
Hemp	783	Pounds	515,400	21,784
Hops	2	Pounds	690	68
Broom corn	95,137	Pounds	60,665,520	2,357,066
Peanuts	49	Bushels	879	939
Dry beans	3,451	Bushels	30,122	46,084
Castor beans	2,688	Bushels	15,695	16,139
Dry pease	12,982	Bushels	103,386	110,554
Potatoes	136,464	Bushels	12,951,971	4,702,033
Sweet potatoes	7,534	Bushels	511,695	303,980
Onions	2,563	Bushels	546,681	284,755
Miscellaneous vegetables	108,282			5,028,148
Maple sugar		Pounds	4,090	478
Maple sirup		Gallons	9,357	9,363
Sorghum cane	9,158	Tons	5,165	14,257
Sorghum sirup		Gallons	625,939	209,087
Sugar beets	1,370	Tons	9,109	36,223
Small fruits	16,794			1,293,233
Grapes	[1] 4,281	Centals	200,094	[2] 383,169
Orchard fruits	[1] 341,675			[3] 3,778,811
Nuts				6,520
Forest products				2,522,332
Flowers and plants	679			1,894,960
Seeds	416			71,456
Nursery products	3,142			578,306
Miscellaneous	2,400			44,110
Total	20,865,406			214,832,706

[1] Estimated from number of trees or vines.
[2] Including value of raisins, wine, etc.
[3] Including value of cider, vinegar, etc

Of the total value of crops, cereals, including Kafir corn, contributed 76.7 per cent; hay and forage, 11.9 per cent; miscellaneous vegetables, 2.3 per cent; potatoes, 2.2 per cent; orchard fruits, 1.8 per cent; forest products, 1.2 per cent; broom corn, 1.1 per cent; flowers and plants, 0.9 per cent; small fruits, 0.6 per cent; and all other products, 1.3 per cent.

The average values per acre of the principal crops are as follows: Flowers and plants, $2,791; nursery products, $184; onions, $111; grapes, $90; small fruits, $77; miscellaneous vegetables, $46; sweet potatoes, $40; tobacco, $38; potatoes, $34; hemp, $28; broom corn, $25; dry beans, $13; cereals, including Kafir corn, $10; and hay and forage, $8. The crops yielding the highest average returns per acre were grown upon very highly improved land. Their production required a relatively great amount of labor, and large expenditure for fertilizers.

CEREALS.

Table 19 is an exhibit of the changes in cereal production since 1849.

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	21,375	6,220	10,266,335	4,570,034	78,869	1,826,143
1889	41,390	9,763	7,863,025	3,870,702	165,598	2,240,932
1879	55,267	16,457	9,019,381	1,959,889	192,138	3,218,542

[1] No statistics of acreage were secured prior to 1879.

PART 2.—BUSHELS PRODUCED.

YEAR.	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	686,580	65,050	398,149,140	180,305,630	1,104,670	19,795,500
1889	1,197,206	107,080	289,697,256	137,624,828	2,628,046	37,389,444
1879	1,229,523	178,859	325,792,481	63,189,200	3,121,785	51,110,502
1869	2,480,400	168,862	129,921,395	42,780,851	2,456,578	30,128,405
1859	1,036,338	324,117	115,174,777	15,220,029	951,281	23,837,023
1849	110,795	184,504	57,646,984	10,087,241	83,364	9,414,575

The total area devoted to cereals in 1879 was 14,461,674 acres; in 1889, 14,191,410 acres; and in 1899, 16,768,976 acres. The increases in the acreages devoted to cereals in the last decade were: Corn, 30.6 per cent; and oats, 18.1 per cent. The decreases were: Wheat, 18.5 per cent; rye, 52.4 per cent; barley, 48.4 per cent; and buckwheat, 36.3 per cent. The total number of bushels grown in 1849 was 77,527,463, and in 1899, 600,106,570.

Of the total area under cereals in 1899, 61.2 per cent was devoted to corn; 27.3 per cent, to oats; 10.9 per cent, to wheat; and 0.6 per cent, to barley, buckwheat, and rye.

A comparison by counties shows that McLean and Champaign counties each produced over 15,000,000 bushels of corn. Livingston and Lasalle counties produced over 13,000,000 each; Iroquois, more than 12,000,000; Vermilion, more than 11,000,000; 27 counties produced from 5,000,000 to 10,000,000; and 58 counties, from 1,000,000 to 5,000,000 bushels each. Oats were raised in all the counties, but particularly in the eastern part of the state, where McLean county shows a yield of over 9,000,000 bushels, and Iroquois over 8,000,000, with Lasalle and Champaign counties following with large yields, in the order named. Wheat is grown in all sections, and rye is generally reported. Buckwheat was raised principally in Hancock, Iroquois, and Adams counties, the acreages for other counties being small.

HAY AND FORAGE.

In 1900, 181,534 farmers, or 68.7 per cent of the total number, reported hay and forage crops. They obtained an average yield of 1.18 tons per acre, exclusive of cornstalks. The total area in hay and forage in 1899 was 3,343,910 acres, or 5.1 per cent less than ten years before.

In 1899 the acreages and yields of the various kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 198,809 acres and 227,528 tons; millet and Hungarian grasses, 65,625 acres and 111,176 tons; alfalfa or lucern, 9,290 acres and 9,572 tons; clover, 362,044 acres and 438,887 tons; other tame and cultivated grasses, 2,444,268 acres and 2,762,546 tons; grains cut green for hay, 142,248 acres and 182,337 tons; crops grown for forage, 121,626 acres and 216,517 tons; and cornstalks, 225,416 acres and 307,648 tons.

In Table 18 the production of cornstalks is included under "hay and forage," but the acreage is included under "corn," as the forage secured was only an incidental product of the corn crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 are shown in the following table.

TABLE 20.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900.	1890.	1899.	1889.
Apples	13,430,006	6,949,336	9,178,150	9,600,785
Apricots	14,444	4,466	1,437	393
Cherries	727,973	288,836	204,279	86,254
Peaches	2,448,013	783,910	66,805	341,178
Pears	795,551	84,067	133,745	57,090
Plums and prunes	572,774	104,111	157,941	31,341

The total number of orchard trees increased from 8,214,726 to 18,047,931 in the decade 1890 to 1900. The number of apple trees nearly doubled, while all other varieties show even larger gains.

Of the total number of trees in 1900, 74.4 per cent were apple trees; 13.6 per cent, peach trees; 4.4 per cent, pear trees; 4.0 per cent, cherry trees; 3.2 per cent, plum and prune trees; and 0.4 per cent, apricot and unclassified trees.

Apples were grown in all parts of the state by 156,709 farmers, or 59.3 per cent of the total number in the state. Marion, Clay, Wayne, and Jefferson counties in the southern part of the state reported one-fifth of the total number. Peach growing is confined principally to the central and southwestern counties, but the other fruits are generally distributed over the state.

In addition to the trees shown in Table 20, unclassified fruit trees to the number of 59,170 are reported, with a yield of 24,854 bushels of fruit. The value of orchard products given in Table 18 includes the value of 75,089 barrels of cider, 19,135 barrels of vinegar, and 1,526,420 pounds of dried and evaporated fruits. The four adjoining counties of Hamilton, Williamson, Saline, and Franklin report considerably over half of this fruit.

The quantity of fruit produced in any year is determined largely by the nature of the season, and comparisons between the crops of the different years have little significance.

VEGETABLES.

The value of all vegetables grown in the state in 1899, including potatoes, sweet potatoes, and onions, was $10,318,916. Of this amount, 45.6 per cent represents the value of potatoes. This important crop was reported by 182,031 farmers, or 68.9 per cent of the total number in the state. Aside from the land devoted to potatoes, sweet potatoes, and onions, 108,282 acres were used in the growing of miscellaneous vegetables. Of this area the products of 56,858 acres were not reported in detail. Of the remaining 51,424 acres, of which detailed reports were received, 19,829 were devoted to sweet corn; 7,317, to watermelons; 7,082, to cabbages; 6,863, to tomatoes; 3,646, to muskmelons; 2,580, to cucumbers; 767, to asparagus; 599, to pease; 494, to rhubarb; 334, to carrots; 333, to celery; 292, to beans; 291, to beets; and 997, to other vegetables.

SMALL FRUITS.

The total area used in the cultivation of small fruits in 1899 was 16,794 acres, distributed among 56,763 farms. The value of the fruits grown was $1,293,233, an average of $23 per farm. Of the total area, 7,113 acres, or 42.4 per cent, were in strawberries, and 5,032 acres, or 30.0 per cent, in blackberries and dewberries. The yields of these fruits were 13,151,330, and 7,294,990 quarts, respectively. The acreage and production of other berries were as follows: Raspberries and Logan berries, 2,909 acres and 3,458,000 quarts; currants, 640 acres and 842,000 quarts; gooseberries, 491 acres and 779,730 quarts; and other berries, 609 acres and 603,166 quarts.

TOBACCO.

The present census shows that in 1899 tobacco was grown by 2,106 farmers on 2,242 acres of land, an average of 1.1 acres for each farm reporting. From this area they produced 1,447,150 pounds. There were decreases in ten years of 46.0 per cent in acreage, and of 52.4 per cent in production. The average production for the five census years, 1849 to1889, was 3,990,938 pounds, the largest crop being in 1859, when 6,885,262 pounds were reported. From that time to the present there has been a steady decrease. The average yield per acre was 645.5 pounds in 1899, and 732.4 pounds in 1889. The total value of the crop of 1899 was $85,411, an average of $40.56 per farm reporting, and $38.10 per acre.

The crop was grown in 77 counties, Saline county leading, with 642 acres, or 28.6 per cent of the entire acreage, and 30.2 per cent of the total production.

SORGHUM CANE.

The present census shows that in 1899, 16,203 farmers raised 9,158 acres of sorghum, from which they sold 5,165 tons of cane for $14,257, and from the remaining product manufactured 625,939 gallons of sirup, valued at $209,087, making the total value of sorghum products for 1899, $223,344, an average of $13.78 for each farm reporting. There was a decrease in acreage from 1889 of 40.5 per cent.

The crop was distributed over 101 counties of the state, the area ranging from 3 acres in Boone to 358 acres in Saline county, which reported the largest acreage. The average area for each farm reporting was 0.57 acre.

BROOM CORN.

In 1899, 95,137 acres, reported by 3,018 farmers, produced 60,665,520 pounds of broom corn, valued at $2,357,066. This is nearly four times the amount reported in 1890. The average area per farm reporting was 31.5 acres; the average yield per acre, 638 pounds; the average value per acre, $24.78; and the average value per pound, 4 cents. The five counties of Coles, Douglas, Moultrie, Edgar, and Cumberland, situated in the east central part of the state, and ranking in the order named, produced more than five-sixths of the total crop.

CASTOR BEANS.

Castor beans were grown in 1899 by 300 farmers, who devoted 2,688 acres to their cultivation and secured therefrom a product of 15,695 bushels, an average of 5.8 bushels per acre. Of the total acreage, 94.0 per cent was reported from the southern counties of Clinton, Franklin, Jefferson, Bond, and Wayne, ranking in the order named.

SUGAR BEETS.

Though begun in the last decade, the growing of sugar beets is rapidly becoming an important branch of agriculture in Illinois. In 1899, 78 farmers devoted to this crop an area of 1,370 acres, an average of 17.6 acres per farm. They obtained and sold from this land 9,109 tons of beets, an average yield of 6.6 tons per acre, and received therefrom $36,223, an average of $464 per farm, $26 per acre, and $3.98 per ton. The cultivation of sugar beets was carried on in 15 counties, but to a very limited extent except in Tazewell county, which reported 72.8 per cent of the total acreage.

NURSERIES.

The total value of nursery stock sold in 1899 was $578,306, reported by the operators of 288 farms and nurseries. Of this number, 126 derived their principal income from the nursery business. They had 7,760 acres of land, valued at $1,442,220; buildings, $249,745; implements and machinery, $29,431; and live stock, $22,190. Their total income, exclusive of products fed to live stock, was $597,351, of which $544,944 represents the value of nursery stock, and $52,407 that of other products. The expenditure for labor was $143,173, and for fertilizers, $5,115. The average gross income was $4,741.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 679 acres, and the value of the products sold therefrom, $1,894,960. These flowers and plants were grown by 646 farmers and florists. Of this number, 499, who made commercial floriculture their principal business, had invested in the aggregate $4,648,056, of which $2,439,163 represents the value of land and improvements other than buildings; $2,096,652, the value of buildings; $90,651, that of implements and machinery; and $21,590, that of live stock. Their sales of flowers and plants amounted to $1,823,809, and other products, $41,913. They expended for labor $420,538, and for fertilizers, $24,222. The average gross income was $3,739.

In addition to the 499 principal florists, 1,199 farmers and market gardeners made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 2,433,114 square feet, making, with the 6,310,906 square feet belonging to the florists' establishments, a total of 8,744,020 square feet.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $22,182,550, an average of $84 per farm. The average was highest on the most intensively cultivated farms, being $1,136 for nurseries, $843 for florists' establishments, $134 for dairy farms, $132 for sugar farms, $119 for vegetable farms, $94 for fruit farms, $91 for hay and grain farms, $69 for live-stock farms, and $49 for tobacco farms. "Managers" expended for labor, $340; "cash tenants," $105; "owners," $77; and "share tenants," $71. White farmers expended $84 per farm, and colored farmers, $23.

Fertilizers purchased in 1899 cost $830,660, an average of $3 per farm, and nearly seven times the amount reported in 1890. The average expenditure was $49 for florists' establishments, $41 for nurseries, $15 for vegetable farms, $6 for dairy farms, $3 for hay and grain farms, $2 for live-stock farms, and $1 for tobacco farms.

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 214. WASHINGTON, D. C. June 28, 1902.

MANUFACTURES.

CARS, STEAM RAILROAD.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I transmit herewith, for publication in bulletin form, a report on the manufacture of steam railroad cars, not including those made by steam railroad companies, and of cars and general shop construction and repairs by steam railroad companies, for the census year, 1900, prepared under my direction by Mr. George A. Hutchins, of the Census Office.

The modern tendency toward concentration of industrial enterprises is well exemplified in the establishments engaged in car construction, not operated by railroad companies. During the twenty years prior to 1900, the number of establishments decreased from 130 to 65, a decrease of 50 per cent, while the capital and product increased 834.9 per cent and 233.3 per cent, respectively, during the same period.

The statistics are presented in 16 tables. Table 1 shows, for the census year, a combined summary of the operations of the two industries, the manufacture of steam railroad cars, not including those made by steam railroad companies, and of cars and general shop construction and repairs by steam railroad companies. Table 2 shows comparative figures for the two industries at the several censuses. The statistics for steam railroad cars, not including operations of steam railroad companies, are presented in Tables 3 to 9, inclusive, as follows: Table 3, showing a comparative summary of steam railroad cars, not including operations of railroad companies, for 1880, 1890, and 1900; Table 4, showing a comparative summary of the statistics of capital for 1890 and 1900; Table 5, showing the cost of materials used in 1900; Table 6, showing a comparative summary by states, 1890 and 1900; Table 7, showing the statistics for this industry in four geographic divisions of the United States; Table 8, showing the exports of cars for 1880, 1890, and 1900; and Table 9, showing the detailed statistics for the industry in 1900, by states and territories. Tables 10 to 16, inclusive, present the statistics for cars and general shop construction and repairs by steam railroad companies, as follows: Table 10, showing a comparative summary of cars and general shop construction and repairs by steam railroad companies for 1890 and 1900; Table 11, showing a comparative summary of the statistics of capital for 1890 and 1900; Table 12, showing the cost of materials used in 1900; Table 13, showing a comparative summary, by states and territories for 1890 and 1900; Table 14, showing the statistics of repair shops in seven geographic divisions of the United States; Table 15, showing a combined summary of the products for 1900; Table 16, showing the detailed statistics for the industry in 1900, by states and territories.

Table 2 shows the growth of the industry for the half century which terminates with the Twelfth Census. The manufacturing statistics of the censuses prior to 1850 were too imperfect and fragmentary in character to make it proper to reproduce them in such a table as a measure of industrial growth in the first half of the century. Owing to changes in the method of taking the census, comparisons between the earlier and later decades, represented in Table 2, should be drawn only in the most general way. Nevertheless, the rate of growth in the manufacture of steam railroad cars may be fairly inferred from the figures given.

The schedules of inquiry for the census of 1900 were designed to elicit complete data relative to this industry, while at the same time care was taken to preserve the basis of comparison with prior censuses. Comparison may be made safely with respect to all the items of inquiry except those relating to capital, salaried officials, clerks, etc., and their salaries, the average number of employees, and the total amount of wages paid. Live capital, that is, cash on hand, bills receivable, unsettled ledger accounts, raw materials, stock in process of manufacture, finished products on hand, and other sundries, was first called for at the census of 1890. No definite attempt was made, prior to the census of 1890, to secure a return of live capital invested.

Changes were made in the inquiries relating to employees and wages in order to eliminate defects found to exist on the form of inquiry adopted in 1890. At the census of 1890 the average number of persons employed during the entire year was called for, and also the average number employed at stated weekly rates of pay, and the average number was computed for the actual time the establishments were reported as being in operation. At the census of 1900 the greatest and least numbers of employees were reported, and also the average number employed during each month of the year. The average number of wage-earners (men, women, and children) employed during the entire year was ascertained by using 12, the number of calendar months, as a divisor into the total of the average numbers reported for each month. This difference in the method of ascertaining the average number of wage-earners during the entire year may have resulted in a variation in the number, and should be considered in making comparisons.

At the census of 1890 the number and salaries of proprietors and firm members actively engaged in the business or in supervision were reported, combined with clerks and other officials. In cases where proprietors and firm members were reported without salaries, the amount that would ordinarily be paid for similar services was estimated. At the census of 1900 only the number of proprietors and firm members actively engaged in the industry or in supervision was ascertained, and no salaries were reported for this class. It is therefore impossible to compare the number and salaries of salaried officials of any character for the two censuses.

Furthermore, the schedules for 1890 included in the wage-earning class, overseers, foremen, and superintendents (not general superintendents or managers), while the census of 1900 separates from the wage-earning class such salaried employees as general superintendents, clerks, and salesmen. It is possible and probable that this change in the form of the question has resulted in eliminating from the wage-earners, as reported by the present census, many high-salaried employees included in that group for the census of 1890.

The 1,361 establishments represented in the combined summary of the two industries, with a capital of $207,904,125 and a product aggregating $308,748,457, employed 207,105 wage-earners during the census year. To these employees the sum of $113,049,623 was paid in wages. In addition to the wage-earners, employment was given to 8,462 salaried officials, clerks, etc., to whom salaries amounting to $7,748,379 were paid. There was expended by these establishments for miscellaneous expenses, $9,131,216, and for the total cost of materials utilized in the manufacture of the product, $171,281,760. It is not to be assumed, however, that a combination of these figures of expenses, subtracted from the total reported value of products, is, in any way, indicative of the profits in the manufacture of these products during the census year. The census schedule takes no cognizance of the cost of selling manufactured articles, or of the interest on capital invested, or of mercantile losses incurred in the business, or of depreciation in plant. Establishments operated by steam railroad companies, constructing and repairing cars for their own use, have, in most cases, considered the value of the product equal to the cost of labor, materials, and miscellaneous expenses incident to the manufacture of same. This statement is necessary in order to avoid erroneous conclusions from the figures presented.

Very respectfully,

S. N. D. North

Chief Statistician for Manufactures.

THE MANUFACTURE OF STEAM RAILROAD CARS.

By George A. Hutchins.

HISTORICAL AND DESCRIPTIVE.

A report of the manufacture of cars and general shop construction and repairs by steam railroad companies, and of steam railroad cars, not including those made by railroad companies, should be prefaced by a brief account of the marvelous growth of that industry, effected by invention, experience, and changed requirements. The development and importance of railroads in the United States have been commensurate with the economic growth and political power of the nation.

The railroad is an important factor in human progress, and has promoted the unification of the nation, by bringing men more closely together, and by furnishing the means of satisfying their wants with the varied treasures and products of the earth. Indeed, this vast network of railways has become the arterial system of national life, carrying to and fro the commerce of the nation and making the world one vast market. Every sphere of the social, industrial, and political world reflects the marvelous achievements of this agent of transportation.

The American railroad car is the outcome of a remarkable yet gradual development. Invention has followed invention, discovery has succeeded discovery, until, from the old-fashioned stage-coach placed on an unstable frame, with four flanged wheels, and heated with a warming pan, has been developed the luxury of the private car of to-day.

The railway was the invention of England, at that time leader of the world in the knowledge of the useful arts. There the power of steam was first utilized and first applied to locomotion. The use of cars for transportation can be traced as far back as the year 1734, when Ralph Allen constructed a stone car which was clearly the forerunner of the freight car of to-day. The first passenger car was constructed in 1814. It consisted simply of the body of a stage-coach mounted on a wooden frame with flanged wheels. It was natural that the stage-coach should be selected as a model, for in it the conveniences of travel had been most highly developed, and it was also a matter of economy, for the stage owners became railroad promoters and transformed their displaced vehicles into railway coaches.[1]

[1] One Hundred Years of American Commerce, Vol. I, page 113.

In 1825 the Stockton and Darlington Railway of England was opened, and trains of coal cars with one passenger coach were run regularly. The coach was well patronized for a time, but when the novelty wore off the faster stage-coaches carried the passengers.

The railway system which had its origin in England was quickly adopted in the United States. In 1827 a crude railway was constructed between Quincy and Boston for the purpose of transporting granite for Bunker Hill monument. The Delaware and Hudson Canal Company, in 1829, opened a road from Honesdale, to Carbondale, Pa., a distance of 16 miles, over which the first locomotive was run in this country. About the same time the South Carolina Railroad was begun. The first division of the Baltimore and Ohio road was opened in 1830. It was at first operated by horsepower, but steam locomotion was substituted in 1832. As early as 1840 a well defined system of railroads had been established in New England, and prior to 1845 the Pennsylvania and Reading was in operation, running to the coal fields of Pennsylvania. By means of these and subsequently constructed lines, the Atlantic states were put in close communication with the vast mineral supplies upon which is based the industrial and commercial development of the country.

In America the changes in car construction have been marked. The first important modifications were made necessary by the speed developed in the locomotive. With increased speed, the light, cast-iron wheels first demanded attention. The shape of the tread and flange was developed by Knight. Edgar and Winans developed the "chilled" features, and Davis altered the disposition of the metal and introduced into the cast-iron wheel a wrought-iron ring, thus perfecting the chill and strengthening the wheel. The light, unsteady cars easily adapted themselves to the unevenness of the road, but the new conditions of speed demanded a stronger rail, a more stable car frame, a flexible truck, and improvement in brakes. Indeed, the development of the locomotive has necessitated a scientific development of the entire railway system.

Adaptation to circumstances has changed the rail from the rude wooden stringer with a piece of strap iron spiked along the top, to the present refined section of steel, whose every dimension, angle, and curve are exactly suited to the tremendous strain it has to bear.

In 1833, Ross Winans, of Baltimore, built three long cars, each capable of seating 60 passengers. With these originated the American passenger car of the present day, and to Winans is due the adoption of cars with longer and more stable frames, having bogie or swiveling four-wheeled trucks at each end. These cars were a marked improvement upon the old coach, yet they have been aptly called "combinations of inconveniences." Until late in the fifties the springs were made of india rubber. These were unsatisfactory because of their tendency to harden with age, and gradually they were replaced by steel springs. The cars had no raised roof. The windows were glazed in solid without any sash, because of the fear that accidents would surely follow should they be opened. The methods of ventilation supplied an abundance of dust and cinders. The lighting was poor. The heat was supplied by cast-iron stoves which broiled those who sat near them, while they failed to warm those who did not.

The proper ventilation of cars is a problem that has not yet been satisfactorily solved. The successful system must at all times supply a sufficient quantity of air, without creating a draft, lowering the temperature, or admitting dust, cinders, smoke, or gases. Probably the best system provides for the admission of air from the exterior of the car to steam pipes where it may be heated before it reaches the interior.

The demand for adequate lighting has resulted in the adoption of a number of different systems. Electric lights are clean, cool, safe, and very desirable, but in their present stage of development they are too expensive for general use. The Pintsch system of lighting, which uses a high quality of oil gas, furnishes a desirable light and one which works well practically. It is safe, clean, of nominal cost, and in case of collisions or derailment does not furnish fuel to the flames.

Many of the dangers of the old platform, buffer, and coupler were eliminated by the patents of Colonel Miller, in 1867, but it was not until after the dining car was introduced that the importance of a safe, covered passageway came to be fully recognized. This need was met by Mr. Pullman in his "vestibuled train," which not only provides for the convenience and safety of the passengers while going from one car to another, but at the same time furnishes a buffer extending from platform to roof, thus producing one of the best anti-telescoping features and greatly lessening the danger to human life in case of collision. The brake, with its wonderful development from the old hand brake to the air brake patented by Westinghouse; and the modern coupler, which is the result of countless experiments and over 6,500 patented inventions, have eliminated many of the dangers of the old methods and devices. Each year shows a marked improvement in features contributing to the comfort and safety of the passenger, and in providing cheap, speedy, regular, and adequate transportation in cars especially adapted to the needs of the public.

In the construction of freight cars, the change has been equally marked. Many devices for the protection of life and property have been readily adopted. There is a general tendency toward specialization. No longer are grain, beef, fruits, and oil shipped in the same kind of cars. The transportation of various kinds of products has called into being cars peculiarly adapted to each class of freight, so that scores of different kinds of cars are now constructed to meet the demands of shippers. Perishable articles are now conveyed in cars which insure their preservation.

The tendency of the changes in the modern freight car is toward increased weight, strength, size, and convenience. In developing these qualities steel has been used in some cases to replace wood, and, in other cases, steel plates have been used to strengthen wooden construction. Ten years ago the steel car industry was in its infancy, but its growth during the decade has been phenomenal. At present the Pressed Steel Car Company, of Pittsburg, Pa., using in the manufacture of its product over 1,600 tons of steel a day, is the largest single consumer of steel in the world. The changes have resulted in an increased carrying capacity of the cars, a decrease in the relative dead weight moved, and a better paying load. Marked advances in the average capacity per car have been made in the last few years. The normal capacity in the sixties was about 15,000 pounds. The capacity increased to 28,000 in 1873; to 40,000 in 1875; to 60,000 in 1885; to 70,000 in 1895; while at the present time cars with a capacity of 80,000 to 100,000 pounds are in every-day use.

The economy of heavy loading has been indisputably proved. According to figures of the Industrial Commission, the average train load for the United States, as a whole, increased from about 175 tons of paying freight in 1890 to 243.5 tons in 1899.

The movement toward combination began among the railroads earlier than in industrial lines, and made possible "through trains" by which goods could be shipped long distances rapidly and at low rates.

The changes that have taken place in business methods have been largely due to improved methods of transportation. The traffic of railroads has become the greatest single business ever carried on in the annals of the world, all other business contributing to swell its volume. It has become one of the greatest factors in changing the conditions of supply and demand and revolutionizing the habits and aspirations of mankind.

The service of railroads in the United States may perhaps be best shown by the statement that during 1900 the passenger mileage amounted to upward of 1,600,000,000 miles, a journey of 211 miles per capita for the population of the country. The ton mileage of freight amounted to 141,599,000,000 tons; that is, the freight service of the country was equivalent to the carriage of this amount of freight 1 mile.[1]

The census year was characterized by extraordinary activity in construction. Table 15 shows that in the car department 144,505 cars were constructed for steam railways, and 8,376,769 cars were repaired. In the motive department of the railroad repair shops 272 locomotives were built, and 1,375,265 were repaired. The number of repairs shown for cars and locomotives may include several repairs on the same car or locomotive. It must not be inferred that the number of single cars and locomotives reach so large a total. The total value of all new equipment manufactured and work necessary to keep the vast amount of rolling stock in repair during the year was $308,748,457.

A study of economic history and industrial progress leads to the conclusion that in no other country has the development of the car industry been more rapid than in the United States. Transportation of persons and property with ease, speed, and safety has ever been the aim of railroad promoters and the demand of the American people, and as a result, the railway system of the United States to-day is the most progressive and among the most perfect in the world.

The statistics presented in the following tables embrace the operations of establishments engaged in the construction of "cars, steam railroad, not including operations of railroad companies," and "cars and general shop construction and repairs by steam railroad companies," during the census year. In these tables the figures showing the manufacture of street cars, whether horse, cable, or electric, appear only where they were constructed as a by-product in large plants engaged in the manufacture of steam railway cars. In the motive power and machinery department, the report of the number of locomotives built and repaired does not include the operations of the regular locomotive works in the country, but only those constructed and repaired by the railroad companies in their repair shops. The report of the bridge and building department includes the shop work only.

In reporting the operations of steam railroad companies, where cars were constructed and repaired for the use of the corporation operating the plant, the value of products equals the cost of labor, materials, and miscellaneous expenses incident to the manufacture of same. It was deemed inexpedient to estimate the market value of the cars constructed for, and repair work done on cars owned by the railroad companies operating their own plants; therefore an increase over cost is shown only on cars constructed for other railroad companies or contract work done for other establishments. Table 1 presents a combined summary for the industries—cars, steam railroad, not including operations of railroad companies, and cars and general shop construction and repairs by steam railroad companies.

[1] Report of Industrial Commission, Vol. XIX, page 262 f.

TABLE 1.—CARS, STEAM RAILROAD: COMBINED SUMMARY FOR THE UNITED STATES, 1900.

	Total.	Cars, steam railroad, not including operations of railroad companies.	Cars and general shop construction and repairs by steam railroad companies.
Number of establishments	1,361	65	1,296
Capital:			
Total	$207,904,125	$88,323,852	$119,580,273
Land	$21,283,601	$4,306,808	$16,976,693
Buildings	$45,860,155	$9,229,810	$36,630,345
Machinery, tools, and implements	$37,987,255	$9,538,673	$28,448,582
Cash and sundries	$102,773,214	$65,248,561	$37,524,653
Salaried officials, clerks, etc., number	8,462	1,366	7,096
Salaries	$7,748,379	$1,638,132	$6,210,247
Wage-earners, average number	207,105	33,453	173,652
Total wages	$113,049,623	$16,987,294	$96,062,329
Miscellaneous expenses	$9,131,216	$2,837,229	$6,293,987
Cost of materials used	$171,281,760	$61,742,747	$109,539,013
Value of products[1]	$308,748,457	$90,510,180	$218,238,277

[1] Including custom work and repairing by steam railroad companies.

The combined summary in Table 1 shows that in the census year there were 1,361 establishments, with a capital of $207,904,125, employing 215,567 wage-earners and salaried officials, with wages and salaries aggregating $120,798,002. The materials used cost $171,281,760 and the value of products aggregated $308,748,457.

Of the 1,361 establishments in the combined industry, 1,296, or 95.2 per cent, were operated by railroad companies. These establishments reported a capital invested of $119,580,273, or 57.5 per cent of the capital of the combined industry. Of 8,462 salaried officials, 7,096, or 83.9 per cent, were employed in shops operated by railroad companies, and received $6,210,247, or 80.1 per cent of the total salaries paid in this industry.

The total number of wage-earners, 207,105, received $113,049,623. There were 173,652 wage-earners employed in railroad repair shops, who received $96,062,329; that is, 83.8 per cent of the total number of wage-earners engaged in this industry were employed by establishments operated by railroad companies, and received 85 per cent of the total wages.

Of the total cost of materials, $109,539,013, or 64 per cent, was reported for establishments operated by railroad companies, and of the $308,748,457 reported for the total value of the product, $218,238,277, or 70.7 per cent, was reported for railroad repair shops.

Steam railroad companies engaged in the construction and repair of cars in 1900, had an average capital of $92,191, with 139 salaried officials and wage-earners, and salaries and wages aggregating $78,914. The cost of materials for each plant averaged $84,521, and the average product was $168,394.

The average capital per establishment in plants not operated by steam railroad companies, in 1900, was $1,358,828. The number of wage-earners and salaried officials per establishment was 536, with wages and salaries aggregating $285,007. The cost of materials per establishment was $949,888, and the value of products was $1,392,464.

The amount of capital per wage-earner, as deduced from the report of railroad repair shops, was $689, and in car construction the reports show $2,640 capital per wage-earner. This difference is due mainly to the fact that car-construction plants not operated in connection with railroad companies usually have more cash on hand, bills receivable, unsettled ledger accounts, stock in process of manufacture, and finished products on hand than does the plant whose product is immediately converted to its own use. The cost of materials and the value of the product per wage-earner for railroad repair shops were $631 and $1,257, respectively, while plants not operated by railroad companies reported $1,846 for the cost of materials used, and $2,706 for value of product per wage-earner.

Table 2 presents a comparative summary of the combined industries, as reported at the several censuses from 1850 to 1900, inclusive, with the per cent of increase for each decade.

Since the beginning of the second quarter of the last century, the manufacture and repair of cars for steam railways has developed until it produces an annual product to the value of over $300,000,000. No comparison can be made with 1880, as the operations of establishments by railroad companies were not reported at that census. The fact that the classification has been slightly changed must also be taken into consideration in comparing the reports of 1890 and 1900 with the reports of previous censuses. The summary for 1870 includes the construction and repair of street railway cars. The Eleventh and Twelfth censuses include the construction of street railway cars only when they are manufactured as a by-product in large steam railway car construction plants. There were separate classifications for the construction and repair of street railway cars in 1890 and 1900. The first census at which the statistics of the manufacture and repair of cars were returned with sufficient accuracy and detail to justify a comparison, was that of 1850. In that year 41 establishments were reported, and in 1860 the number was increased to 62, an increase of 21 establishments, or 51.2 per cent. The capital increased $2,057,702, or 229.7 per cent, and during the decade the value of the product increased $1,809,055, or 72.5 per cent. From 1860 to 1870 there was an increase of 109 establishments, or 174.2 per cent, while the capital increased $13,669,075, and the value of the product increased $26,768,121. From 1870 to 1890 the number of establishments increased 617; the capital, $103,200,895; the cost of materials increased $93,118,305; and the value of the product advanced $168,474,701.

Table 2.—CARS, STEAM RAILROAD: COMPARATIVE SUMMARY, 1850 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

	DATE OF CENSUS.						PER CENT OF INCREASE.			
	1900	1890	1880[4]	1870	1860	1850	1890 to 1900	1870 to 1890	1860 to 1870	1850 to 1860

Miscellaneous expenses	$9,131,216	$1,725,113	......	(2)	(2)	(2)	429.3	....	....	....
Cost of materials used	$171,281,760	$111,236,012	......	$18,117,707	$1,841,344	$1,393,676	54.0	514.0	883.9	32.1
Value of products[5]	$308,748,457	$199,545,435	......	$31,070,734	$4,302,613	$2,493,558	54.7	542.2	622.1	72.5

[1] Not reported separately.
[2] Not reported.
[3] Includes proprietors and firm members, with their salaries.
[4] No comparison can be made for 1880.
[5] Including cu om work and repairing by steam railroad companies.

During the last decade the car industry has shown another marked advance. In 1890 there were 787 establishments, with a capital of $119,833,687, and an aggregate product of $199,545,435; in 1900 there were 1,361 establishments, with a capital of $207,904,125, and an aggregate value of product of $308,748,457; an increase of 574, or 72.9 per cent, in the number of establishments, $88,070,438 in capital, and $109,203,022, or 54.7 per cent, in value of product. The total number of wage-earners has increased from 1,554, with wages aggregating $664,708, in 1850, to 207,105, with wages aggregating $113,049,623, in 1900. Of the total number of employees in this industry in 1900, 206,345, or 99.6 per cent, were men over 16 years of age. Thus Table 2 shows the remarkable growth of this industry during the past half century. The striking increase in the number of establishments, from 41 in 1850 to 1,361 in 1900, an increase of 1,320, has not kept pace with the increase in capital, wage-earners, wages, materials, and product during the same period.

The following are the averages per establishment for 1850 and 1900, respectively: Capital, $21,855 and $152,758; wage-earners, 38 and 152; wages, $16,212 and $83,064; cost of materials, $33,992 and $125,850; and product, $60,818 and $226,854.

CARS, STEAM RAILROAD, NOT INCLUDING THE OPERATIONS OF RAILROAD COMPANIES.

Table 3 presents a comparative summary, 1880 to 1900, with percentages of increase.

TABLE 3.—CARS, STEAM RAILROAD, NOT INCLUDING OPERATIONS OF RAILROAD COMPANIES: COMPARATIVE SUMMARY, 1880 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

	DATE OF CENSUS.			PER CENT OF INCREASE.

[1] Decrease.
[2] Includes proprietors and firm members, with their salaries; number only reported in 1900, but not included in this table. (See Table 8.)
[3] Not reported separately.

One of the most notable features in the above table is the decrease in the number of establishments, caused by the combination or consolidation of a number of plants under a single corporate management. While the number of establishments had decreased 50 per cent from 1880 to 1900, the capital increased more than eightfold, or $79,051,172, and the value of the product increased $62,512,589, or 223.3 per cent, during the same period. In 1880 there were 130 establishments, and in 1890 the number had been reduced to 71; a decrease of 59 establishments, or 45.4 per cent, during the decade. From 1890 to 1900 there was a decrease of 6 establishments, or 8.5 per cent. The capital increased from $9,272,680 in 1880 to $43,641,210 in 1890, and in 1900 the aggregate capital was $88,323,852, an increase of $44,682,642, or 102.4 per cent, over 1890. The amount paid to wage-earners showed an increase of $10,569,076, or 191.9 per cent, from 1880 to 1890, and a further increase of 5.7 per cent during the last decade, while the number of wage-earners increased 120.3 per cent from 1880 to 1890 and 6.7 per cent during the succeeding decade.

In comparing the increase in the cost of materials used and the value of the product, we find that from 1880 to 1890 the cost of materials increased $24,894,215, or 125.9 per cent, and the value of the product increased $42,086,146, or 150.3 per cent. In 1890 the cost of materials was $44,674,486, and in 1900 it was $61,742,747, an increase of $17,068,261, or 38.2 per cent. The value of the product increased from $70,083,737 to $90,510,180, or 29.1 per cent. From 1880 to 1890 the number of women employed increased from 13 to 254, but the next decade showed a decrease from 254 to 107, or 57.9 per cent. The number of children employed decreased 41.3 per cent from 1880 to 1890. During the last decade the number of children employed increased from 196 in 1890 to 210 in 1900, or 7.1 per cent, and the wages increased from $34,950 in 1890 to $52,299 in 1900, or 49.6 per cent. The increase in the average wages paid to children is probably due to the fact that more complex machinery is being used, and also to laws enacted by various states, defining and limiting the ages and number of hours per day which a minor shall work in mines or in manufacturing and mechanical industries. The capital, materials, and value of product have increased faster than has the number of wage-earners, showing that with increased equipment of plant an operative can use more material and manufacture a larger product than in 1880 or 1890.

While the number of establishments has decreased from 130 to 65 from 1880 to 1900, the average capital per establishment has increased from $71,328 to $1,358,828. The average cost of materials was $152,156 per establishment in 1880, and $949,888 in 1900, and the value of the product increased from $215,366 per establishment in 1880 to $1,392,464 in 1900. The amount of capital per wage-earner was $652 in 1880; $1,392 in 1890; and $2,640 in 1900. The cost of materials per wage-earner was $1,390 in 1880; $1,425 in 1890; and $1,846 in 1900. The value of the product manufactured by each wage-earner was $1,967 in 1880; $2,235 in 1890; and $2,706 in 1900.

Table 4 presents a comparative summary of the capital for 1890 and 1900 with the per cent that each item is of the total, and the per cent of increase during the decade.

TABLE 4.—CARS, STEAM RAILROAD, NOT INCLUDING OPERATIONS OF RAILROAD COMPANIES: COMPARATIVE SUMMARY OF CAPITAL, 1890 AND 1900.

	1900		1890		Per cent of increase.
	Amount.	Per cent of total.	Amount.	Per cent of total.	
Total	$88,323,852	100.0	$43,641,210	100.0	102.4
Land	4,306,808	4.9	3,811,086	8.7	13.0
Buildings	9,229,810	10.4	7,878,189	18.1	17.2
Machinery, tools, and implements	9,538,673	10.8	7,626,804	17.5	25.1
Cash and sundries	65,248,561	73.9	24,325,131	55.7	168.6

The total capital for 1900 was $88,323,852, while in 1890 it was $43,641,210; an increase of $44,682,642, or 102.4 per cent, during the decade. In 1890 the value of land was $3,811,086, which was 8.7 per cent of the total capital, and in 1900 the value was $4,306,808, or 4.9 per cent of the total; an increase of $495,722, or 13 per cent. The value of buildings increased from $7,878,189 in 1890 to $9,229,810 in 1900, an advance of 17.2 per cent. An increase of 25.1 per cent, or $1,911,869, in the value of machinery, tools, and implements makes that item now exceed the value of buildings, and more than double the total value of land. The most marked increase is found in the item of capital, which includes cash on hand, bills receivable, unsettled ledger accounts, raw materials, stock in process of manufacture, finished products on hand, and other sundries. In 1890 the value of this item was $24,325,131, or 55.7 per cent of the total. The item increased $40,923,430, or 168.2 per cent, during the decade, and in 1900 formed 73.9 per cent of the total capital. It can readily be seen that the constant demand for new varieties of cars, and the tendency to use steel in place of wood requires new and more expensive equipment, as well as a greater amount invested in materials in process of manufacture, and an increased value of finished products on hand.

Table 5 presents the cost of all materials used.

TABLE 5.—CARS, STEAM RAILROAD, NOT INCLUDING OPERATIONS OF RAILROAD COMPANIES: COST OF MATERIALS USED, 1900.

MATERIALS USED.	Amount.	Per cent of total.
Total	$61,742,747	100.0
Principal materials[1]	59,773,393	96.8
Fuel	1,021,046	1.7
Rent of power and heat	313	(2)
Freight	947,995	1.5

[1] Includes mill supplies, and all other materials, which are shown separately in Table 8.
[2] Less than one-tenth of 1 per cent.

The cost of partially manufactured materials, or those which have passed through one or more stages of production, such as lumber, iron, steel, etc., constituted the principal item, aggregating more than nine-tenths the total cost. The amount paid for rent of power and heat was very small, showing that practically all of the power used in car construction was owned by the company operating the plant. The cost of fuel was $1,021,046, or 1.7 per cent, and the amount of freight paid was $947,995, or 1.5 per cent of the total cost. During the decade the cost of materials increased $17,068,261, or 38.2 per cent.

The miscellaneous expenses, comprising rent of works, taxes, contract work, rent of offices, interest, insurance, ordinary repairs to buildings and machinery, and expenses incurred in the manufacture of the product, other than those reported for wages and materials, aggregated $2,837,229. (See Table 9.) The amount paid for ordinary repairs of buildings and machinery, and for insurance, interest, advertising, etc., is the principal item of the miscellaneous expenses, aggregating $2,240,558, or 79 per cent of the total. Of the remaining items, contract work forms 14.3 per cent of the total expenses; taxes, 5.6 per cent; and rent of works only 1.1 per cent. No comparison of the separate items of miscellaneous expenses can be made with previous censuses, as in 1890 reports were made of total expenses only, and no figures were presented previous to the Tenth Census.

In 1890 there were in the United States 71 establishments engaged in car construction other than those operated by steam railroad companies, and during the decade 17 new establishments were constructed, but in 1900 only 65 establishments were in operation. This condition clearly illustrates the industrial changes which are constantly taking place in the commercial world. It does not necessarily indicate that 23 establishments formerly engaged in car construction have gone out of business and their plants are idle. In many cases the larger manufacturers have purchased the plants of their smaller competitors, and now use them for the manufacture of supplies for the central plants. Thus the product has been changed, and they can no longer be classified as establishments engaged in car construction and repairs. In some instances an establishment which was classified under "foundry and machine shop products" in 1890 had so changed its product that "car construction" predominated in 1900. This may account for the fact that, in some states, there was an increased number of establishments engaged in this industry, without a corresponding increase in the number of plants constructed during the decade.

In considering the location of the various plants it is interesting to note that a large part of the manufacturing was done near the various supply centers as well as in places convenient to commercial centers. In 1890 Pennsylvania was the leading state, with 15 establishments; in 1900 the number was reduced to 11. In Illinois the number of establishments has increased from 9 to 17, with a corresponding increase in production, and both in the number of plants engaged in the industry, and in the value of the product, this state has now taken first place. The North Central and the North Atlantic states, on account of their close proximity to coal fields, lumber districts, and the great commercial centers, have special advantages in the manufacture of cars, and in them are found the greatest number of well-equipped plants, and the greatest activity in the construction of new plants during the decade.

From the accompanying tables it will be seen that a large percentage of the establishments engaged in the manufacture of steam railroad cars, exclusive of those made by railroad companies, were located within a comparatively small area. The cities of Chicago, Joliet, Madison, Mt. Vernon, Litchfield, and East St. Louis, in Illinois, and St. Louis and St. Charles, in Missouri, reported a product of $32,568,374, or 36 per cent of the total product for the United States. Michigan City, Terre Haute, Indianapolis, and Jeffersonville, in Indiana, reported a product of $9,006,577, or 10 per cent of the total. Establishments in Allegheny, Pittsburg, McKees Rocks, Berwick, and Milton, in Pennsylvania, showed a product of $17,724,290, or 19.6 per cent of the total. The cities of Rochester, Buffalo, and Depew, in New York, showed a product of $5,228,351, or 5.8 per cent of the total. Detroit, Mich., Dayton, Ohio, and Wilmington, Del., reported a product of $16,707,419, or 18.5 per cent of the total.

The larger plants are, for the most part, located in the suburb of some large city, near the coal and iron districts, and in places where supplies of lumber are easily obtained. These conditions give the plant so located the advantage of being close to the great commercial centers and in a position to obtain skilled labor on short notice. The value of products, for the cities enumerated above, aggregated $81,235,012 or 89.8 per cent of the total for this branch of industry.

Table 6 presents a comparative summary of the number of establishments, capital, salaried officials and salaries, wage-earners and wages, miscellaneous expenses, cost of materials, and products, for states having 3 establishments and over, in 1890 and 1900.

TABLE 6.—CARS, STEAM RAILROAD, NOT INCLUDING OPERATIONS OF RAILROAD COMPANIES: COMPARATIVE SUMMARY, BY STATES, 1890 AND 1900.

STATES.	Year.	Number of establishments.	Capital.	SALARIED OFFICIALS, CLERKS, ETC.		WAGE-EARNERS.		Miscellaneous expenses.	Cost of materials used.	Value of products.
				Number.	Salaries.	Average number.	Total wages.

	1890	5	2,843,166	21	38,890	1,326	594,505	92,007	2,817,578	4,784,136
Pennsylvania	1900	11	33,828,723	414	426,399	5,840	3,111,556	1,265,456	12,188,811	19,260,910
	1890	15	7,060,466	128	141,866	3,524	1,397,176	465,900	6,496,268	10,080,722
All other states	[1]1900	13	9,166,320	127	163,046	3,075	1,239,238	189,294	6,403,869	7,307,894
	[2]1890	20	8,579,624	115	101,438	2,656	1,228,224	297,251	5,768,584	9,517,810

[1] Includes establishments distributed as follows: Alabama, 2; Georgia, 2; Kentucky, 1; Maryland, 1; Massachusetts, 2; New Hampshire, 1; New Jersey, 2; Tennessee, 1; West Virginia, 1.
[2] Includes establishments distributed as follows: Alabama, 3; California, 1; Florida, 1; Kansas, 2; Kentucky, 2; Massachusetts, 3; Minnesota, 2; New Hampshire, 1; North Carolina, 1; Tennessee, 2; Virginia, 1; West Virginia, 1.

The states which show a decrease in both capital and product are Delaware and Ohio. The state of Michigan, while showing an increase in capital, reported a decrease in value of product of $1,157,501, or 10.4 per cent. In Illinois the capital increased from $10,070,784 in 1890 to $18,732,466 in 1900, or 86 per cent. The value of the product in 1890 was $17,117,223, and in 1900 an increase of $7,728,383, or 45.1 per cent, was shown. Indiana reported an increase of $862,294, or 16.6 per cent, in capital, and the product increased $1,933,248, or 27.3 per cent, during the decade. Missouri in 1890 reported a capital of $1,442,927; in 1900 the capital was $4,530,982, an increase of $3,088,055, or 214 per cent. The product increased from $3,974,173 in 1890 to $7,722,768 in 1900, or 94.3 per cent. The capital in New York increased 134.3 per cent, and the value of the product showed an increase of $2,061,580, or 65.1 per cent. Pennsylvania showed an increase of 379.1 per cent in capital, and an increase of $9,180,188, or 91.1 per cent, in the value of the product. The marked increase in capital in Pennsylvania was caused by the construction of new plants for the manufacture of pressed steel cars. The value of the products shown for the establishments which had been in operation only a few months during the census year was only a small fraction of their annual capacity, and therefore the value of plant and cost of equipment, together with the other items of capital, makes it appear that the increase in capital was disproportionate to that of products.

Alabama and Massachusetts each had 3 establishments in 1890, but in 1900 only 2 establishments were reported, operating independent of railroad repair shops, and no comparison can be made for the two censuses for these states.

Table 7 presents the operations of establishments engaged in car construction, exclusive of plants operated by railroad companies, in four geographic divisions.

TABLE 7.—CARS, STEAM RAILROAD, NOT INCLUDING OPERATIONS OF RAILROAD COMPANIES: COMPARATIVE SUMMARY, BY GEOGRAPHIC DIVISIONS, 1900.

	Number of establishments.	CAPITAL.					SALARIED OFFICIALS, CLERKS, ETC.		WAGE-EARNERS, INCLUDING PIECEWORKERS, AND TOTAL WAGES.		Miscellaneous expenses.	Cost of materials used.	Value of products (including custom work and repairing).
		Total.	Land.	Buildings.	Machinery, tools, and implements.	Cash and sundries.	Total number.	Total salaries.	Average number.	Total wages.			
United States	65	$88,323,852	$4,306,808	$9,229,810	$9,538,673	$65,248,561	1,366	$1,538,132	33,453	$16,987,294	$2,837,229	$61,742,747	$90,510,180

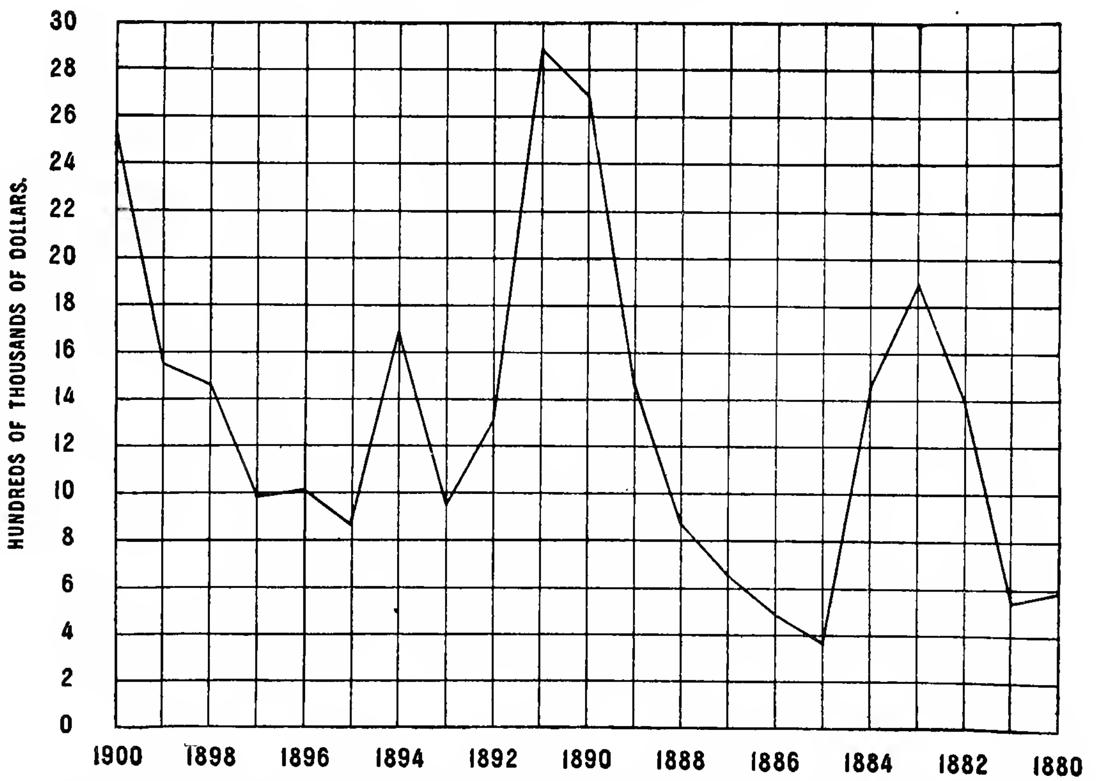
In the United States there were 65 establishments, with the value of products aggregating $90,510,180. The New England states, with 3 establishments, or 4.6 per cent of the total, manufactured a product of $825,012, or 0.9 per cent of the total value. In the Middle states there were 21 establishments, with an aggregate product of $30,121,982, or 33.3 per cent of the total. The Southern states, with 10.8 per cent of the total number of establishments engaged in this industry, manufactured a product of $4,125,083, or 4.6 per cent of the total. The Central states reported 34 establishments, with a product of $55,438,103, or 61.2 per cent of the total. In the New England division each establishment reported an average of 4 salaried officials, with an average salary of $1,556. The Middle states reported 29 salaried officials per establishment, with an average salary of $1,038. The salaries of 660 officials in the Central states averaged $1,196, and in the Southern states the average establishment had 13 officials, with an average salary of $1,153.

EXPORTS OF PASSENGER AND FREIGHT CARS FOR STEAM RAILROADS 1880 TO 1900.



The constantly increasing traffic in this country rapidly absorbs the product of the car shops, but there is also a foreign demand of considerable magnitude for American-built cars. This demand changes with the varying industrial conditions and commercial activity of the countries importing these products, as well as with the economic conditions existing in this country.

The above graphic chart shows the value of cars, passenger and freight, for steam railroads, exported, 1880 to 1900.

In 1890 and 1891 the value of exported cars exceeded the value in 1900. During the business depression which followed there was a marked decrease in the number of cars constructed, both for foreign and domestic use. The construction of freight cars was the first to be affected. The number of passenger cars constructed in this country did not decrease materially until after the Columbian Exposition in 1893. The foreign demand and the exposition were potent factors in keeping many of the shops running during 1893. A year or two later the demand for freight cars began to increase, and since 1897 the demand for both passenger and freight cars for foreign and domestic use has shown a constant growth. The exports for 1900, aggregating $2,558,323, exceeded the average yearly exports from 1880 to 1890 by $1,581,872; those from 1890 to 1900 by $756,484; and the average for twenty years by $1,169,178.

Table 8 presents the statistics of exports of cars and parts of cars, passenger and freight, for steam railways, 1880, 1890, and 1900.

[1] Annual Reports United States Treasury Department on Commerce and Navigation of the United States, 1880, 1890, and 1900.

The exports to South American countries decreased from $1,648,210 in 1890 to $279,181 in 1900. This was probably due to the fact that there was less activity in railway construction than at the beginning of the decade; also to the fact that the railways which were in process of construction in 1890 were in a position to supply their own equipment. The exports to North American countries during the decade increased $466,266; to Europe, $280,147; and to Oceania, $51,854. No cars or parts of cars were exported to Asia or Africa in 1890, but in 1900 these exports to Asia were valued at $33,492, and those to Africa at $405,895.

Table 9 presents in detail, for 1900, the statistics relating to the manufacture of cars, steam railroad, not including operations of railroad companies, by states and territories.

CARS AND GENERAL SHOP CONSTRUCTION AND REPAIRS BY STEAM RAILROAD COMPANIES.

Table 10 presents the statistics for general shop construction and repairs by steam railroad companies as returned at the censuses of 1890 and 1900, with the percentages of increase during the decade.

TABLE 10.—CARS AND GENERAL SHOP CONSTRUCTION AND REPAIRS BY STEAM RAILROAD COMPANIES: COMPARATIVE SUMMARY, 1890 TO 1900, WITH PER CENT OF INCREASE.

	DATE OF CENSUS.		PER CENT OF INCREASE.
	1900	1890	1890 to 1900
Number of establishments	1,296	716	81.0
Capital	$119,580,273	$76,192,477	56.9
Salaried officials, clerks, etc., number	7,096	1,953	263.3
Salaries	$6,210,247	$1,584,242	292.0
Wage-earners, average number	173,652	106,632	62.9
Total wages	$96,062,329	$60,213,433	59.5
Men, 16 years and over	173,209	106,448	62.7
Wages	$95,939,610	$60,161,333	59.5
Women, 16 years and over	364	128	184.4
Wages	$106,426	$39,248	171.2
Children, under 16 years	79	56	41.1
Wages	$16,293	$12,852	26.8
Miscellaneous expenses	$6,293,987	(1)	....
Cost of materials used	$109,539,013	$66,561,526	64.6
Value of products, including custom work and repairing	$218,238,277	$129,461,698	68.6

1 Not reported.

The census of 1890 was the first at which the statistics of the manufacture of cars by steam railroad companies were reported separate from the statistics of the operations of plants, engaged in car construction, not conducted by railroad companies. During the decade the number of establishments has increased from 716 to 1,296, an increase of 480, or 81 per cent, while the capital has increased $43,387,796, or 56.9 per cent. The cost of materials used increased from $66,561,526 in 1890, to $109,539,013 in 1900, or 64.6 per cent; and the value of the product, including custom work and repairing, was $129,461,698 in 1890, and $218,238,277 in 1900, an increase of $88,776,579, or 68.6 per cent.

The most striking increase was shown in the number of salaried officials, clerks, etc., and their salaries. In 1890 the number of salaried officials was 1,953, and in 1900 there were 7,096 officials, an increase of 5,143, or 263.3 per cent. During the same period the salaries increased $4,626,005, or 292 per cent. This increase is all the more striking, when it is remembered that the number for 1900 does not include the firm members and officials not drawing a salary. The total number of wage-earners increased 62.9 per cent, while the wages increased from $60,213,433 in 1890 to $96,062,329 in 1900, or 59.5 per cent.

Improved facilities for transportation by steam railways have resulted in constantly lessening the competition of canal and river transportation, and now they have ceased to be effective for high-grade freight transportation. The extraordinary increase in traffic requires new equipment at the rate of about 500 cars and 10 locomotives per day. The repair work both on locomotives and cars has constantly increased. During the census year the 1,296 establishments operated by railroad companies reported a capital of $119,580,273, and a product aggregating $218,238,277, and employed 180,748 wage-earners and officials. In this branch of the industry the product of the several establishments was manufactured or repaired for their own use. In the motive power and machinery department the total value of product was $94,447,260, or 43.3 per cent of the aggregate. The product in the car department was valued at $118,376,552, or 54.2 per cent, and the value of the shop work in the bridge and building department was $5,414,465, or 2.5 per cent of the aggregate product.

Table 11 presents a comparative summary of the capital for 1890 and 1900, with the percentage of each item to the total and the per cent of increase during the decade.

TABLE 11.—CARS AND GENERAL SHOP CONSTRUCTION AND REPAIRS BY STEAM RAILROAD COMPANIES: COMPARATIVE SUMMARY OF CAPITAL, 1890 AND 1900.

	1900		1890		Per cent of increase.
	Amount.	Per cent of total.	Amount.	Per cent of total.	
Total	$119,580,273	100.0	$76,192,477	100.0	56.9
Land	16,976,693	14.2	10,860,668	14.3	56.3
Buildings	36,630,345	30.6	25,399,382	33.3	44.2
Machinery, tools, and implements	28,448,582	23.8	18,473,121	24.2	54.0
Cash and sundries	37,524,653	31.4	21,459,306	28.2	74.9

In 1890 the total capital was $76,192,477, and in 1900 it was $119,580,273, an increase of $43,387,796, or 56.9 per cent. The value of land, buildings, machinery, tools, and implements, cash on hand, etc., relative to the total, has not changed materially during the decade. Of the total capital in 1890 the value of land composed 14.3 per cent; buildings, 33.3 per cent; and machinery, tools, etc., 24.2 per cent. In 1900 the value of land was 14.2 per cent; buildings, 30.6 per cent; and machinery, tools, etc., 23.8 per cent of the total capital. The largest per cent of increase was in the item including stock in process of manufacture, unfinished products on hand, etc., the aggregate value of which was $21,459,306, or 28.2 per cent of the total in 1890, and in 1900 the value was $37,524,653, or 31.4 per cent of the total, an increase of $16,065,347, or 74.9 per cent. During the decade the amount of capital invested in land increased 56.3 per cent; buildings, 44.2 per cent; and machinery, tools, and implements, 54 per cent.

Table 12 presents the cost of materials used, with per cent which each item forms of the total cost.

TABLE 12.—CARS AND GENERAL SHOP CONSTRUCTION AND REPAIRS BY STEAM RAILROAD COMPANIES: COST OF MATERIALS USED, 1900.

MATERIALS USED.	Amount.	Per cent of total.
Total	$109,539,013	100.0
Principal materials[1]	106,554,718	97.3
Fuel	2,443,987	2.2
Rent of power and heat	27,565	(2)
Freight	512,743	0.5

[1] Includes mill supplies and all other materials, which are shown separately in Table 16.
[2] Less than one-tenth of 1 per cent.

The partially manufactured materials, such as lumber, iron, and steel, etc., constitute the principal item, aggregating 97.3 per cent of the total. The cost of fuel was $2,443,987. The amount paid for rent of power and heat was $27,565, or less than one-tenth of 1 per cent of the total cost of materials, showing that nearly all of the power used was owned by the company operating the plant. The expenses, other than those for wages and materials, incurred in the manufacture of the product are reported in detail under miscellaneous expenses in Table 16. Of the total expense, $3,094,941, or 49.2 per cent, was paid for contract work. The second item in importance, aggregating $2,329,924, was paid for rent of offices, interest, insurance, ordinary repairs of buildings and machinery, advertising, etc. Of the remaining items, rent of works formed only 0.7 per cent, while the amount paid for taxes constituted 13.1 per cent of the miscellaneous expenses, showing that a large percentage of the plants were owned by the corporations operating them.

Table 13 presents a comparative summary between 1890 and 1900, by states and territories.

TABLE 13.—CARS AND GENERAL SHOP CONSTRUCTION AND REPAIRS BY STEAM RAILROAD COMPANIES: COMPARATIVE SUMMARY, BY STATES AND TERRITORIES, 1890 AND 1900.

[1] Not reported separately in 1890.
[2] Includes establishments distributed as follows: Alaska, 1; District of Columbia, 2.
[3] Includes establishments distributed as follows: Indian Territory, 2; North Dakota, 2; Rhode Island, 2; South Dakota, 2; Utah, 2; Wyoming, 1.

In 1890 there were in the United States 716 railroad repair shops, and during the decade the number increased 580, or 81 per cent. The New England states reported 63 establishments in 1900, an increase of 17, or 43.2 per cent, since 1890. The Middle states increased 129, or 91.5 per cent; the Southern, 152, or 114.3 per cent; the Central, 164, or 53.4 per cent; the Western, 77, or 110 per cent, while the Pacific states increased 40, or 200.0 per cent. The largest actual increase during the decade has been in the Central and Southern states, which have also shown the greatest activity in the establishment of new plants during the census year.

The only decreases in number of plants were found in Vermont and the District of Columbia. The other states and territories except New Jersey and Nevada show an increase. The largest percentages of increase were in the Western and Pacific states.

In 1890 the 3 states having the greatest number of plants were Illinois with 70, Ohio with 64, and Pennsylvania with 61. In 1900 Pennsylvania led with 144 establishments, Illinois was second with 98, and Ohio third, reporting 91 plants in operation.

Of the 51 states and territories included in the comparative table, 6 have shown a decrease in the value of the product. The value of the products in New Jersey decreased $1,016,912; in Delaware, $267,802; in Maryland, $505,806; in Nevada, $139,099; and in Oregon, $724,757. The decrease in the product in the District of Columbia can not be shown, on account of disclosing the operations of individual establishments.

There has been a remarkable increase in value of products—$88,776,579, or 68.6 per cent, during the decade. Pennsylvania led with an increase of $14,295,443, New York was second with an increase of $7,148,825, and Texas third with a product of $8,314,691, an advance $5,454,456 over 1890. The states which show an increase of from three to five millions in the manufactured product are Virginia, Kentucky, Ohio, Illinois, Minnesota, Wisconsin, and Kansas; while those which show an increase of from one to three millions are Connecticut, West Virginia, North Carolina, Georgia, Tennessee, Alabama, Louisiana, Michigan, Indiana, Iowa, Missouri, Colorado, Washington, and California.

Table 14 presents the statistics by geographic divisions for the manufacture and repair of steam railroad cars, by establishments operated by steam railroad companies.

TABLE 14.—CARS AND GENERAL SHOP CONSTRUCTION AND REPAIRS BY STEAM RAILROAD COMPANIES: COMPARATIVE SUMMARY, BY GEOGRAPHIC DIVISIONS, 1900.

	Number of establisbments.	CAPITAL.					SALARIED OFFICIALS, CLERKS, ETC.		WAGE-EARNERS, INCLUDING PIECEWORKERS, AND TOTAL WAGES.		Miscellaneous expenses.	Cost of materials used.	Value of products (including custom work and repairing).

[1] Includes Alaska.

The Middle states led in the manufacture of products in this branch of the industry, with 20.8 per cent of the total number of establishments, 31.1 per cent of the capital invested, and with products valued at $70,132,571, or 32.1 per cent of the total value. The Central states, with 36.3 per cent of the establishments and 34.1 per cent of the capital invested in the industry, manufactured a product valued at $69,503,153, or 31.8 per cent of the total. The Southern states manufactured 18.5 per cent; the Western, 8.7 per cent; the Pacific states, including Alaska, 4.7 per cent; and the New England states, 4.2 per cent of the total product.

The establishments of New England had an average capital of $115,875; those of the Middle states, $137,922; of the Southern states, $58,195; of the Central states, $86,514; of the Western states, $78,230; and of the Pacific states, $103,465. The average value of products for the various geographic divisions were as follows: New England, $144,899; Middle states, $259,750; Southern, $141,689; Central, $147,565; Western, $128,630; and Pacific states, $169,735.

The average wages in New England were 5.8 per cent above the average for the United States; in the Middle states, 2.5 per cent below the average; in the Southern states, 4.3 per cent below; in the Central states, 2.7 per cent below; in the Western states, 14.3 per cent above; and in the Pacific division the average wages were $705, or 27.5 per cent above the average wages for the industry.

Table 15 presents the statistics of the products for the combined industries, cars and general shop construction and repairs by railroad companies, and cars, steam railroad, not including the operations of railroad companies.

[1] Alaska, 1; District of Columbia, 2.

The above table divides the product into 3 departments—the motive power and machinery, the car department, and the bridge and building department. The construction of new locomotives is almost entirely done by establishments engaged exclusively in that work, but a few were built in the car construction plants. In the motive power and machinery department, Pennsylvania led, both in the number of loco motives constructed and the value of the repair work. In the car department, the value of the street cars which were constructed as a by-product was included under "all other products." Of the 1,371 passenger cars constructed for steam railroads, 381 were manufactured in Illinois, 233 in Delaware, 207 in Ohio, 153 in Pennsylvania, and 117 in Missouri; that is, about four-fifths of the passenger cars were constructed in these 5 states. Illinois, Pennsylvania, Michigan, Indiana, and Missouri manufactured 111,324 freight cars, or 77.8 per cent of the total product of the United States.

The value of the products in the bridge and building department, including shop work only, was $5,414,465. The product in the motive and power department aggregated $94,447,260, and in the car department $208,-886,732. The average value of locomotives constructed was $12,046. The value of 143,134 freight cars was $77,240,632, or an average of $540.

The 10 states leading in the construction and repair of steam railway cars were: Pennsylvania, with a product of $62,326,081; Illinois, with $41,426,030; New York, with $21,423,201; Indiana, $19,248,999; Ohio, $16,917,554; Michigan, $14,253,707; Missouri, $14,-246,889; Texas, $8,314,691; California, $7,553,626; and Kansas, $6,816,816. The aggregate value of the products for these states was $212,527,594, or 68.8 per cent of the total value for the United States. The products for the first five states aggregated $161,341,865, or 52.3 per cent of the total value.

Table 16 presents in detail the statistics relating to cars and general shop construction and repairs by steam railroad companies, by states and territories, in 1900.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 215. WASHINGTON, D. C. June 28, 1902.

MANUFACTURES.

COTTON MANUFACTURES.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I transmit herewith, for publication in bulletin form, a report on cotton manufactures, prepared under my direction by Mr. Edward Stanwood, of Boston, acting in the capacity of an expert special agent of the division of manufactures of the Census Office.

In the presentation of the statistics for the industry at the census of 1900, establishments chiefly engaged in the manufacture of cotton small wares, which at prior censuses were included as part of the industry, have been excluded, and separately treated, both in this report and in the general classification of industries.

Although the industry as a whole shows a fair percentage of increase for the decade ending with 1900, there have been periods of great depression interspersed with those of prosperity. The notable feature of the industry during the last ten years was the wonderful growth and universal prosperity of the industry in the Southern states.

The statistics of the cotton manufactures proper are presented in 24 tables: Table 1 showing the annual imports of manufactures of cotton from 1821 to 1900; Table 2 showing the annual exports of cotton manufactures from 1826 to 1900; Table 3 showing the annual exports of foreign manufactures of cotton from 1821 to 1900; Table 4 being a comparative summary of cotton manufactures for the several censuses from 1840 to 1900; Table 5 showing the chief features of the statistics for 1900 for cotton goods and cotton small wares, separately, and the per cent that each industry is of the total; Table 6 showing the number of spindles in cotton mills within 30 miles of Providence, R. I.; Table 7 being a comparative summary of capital invested, by geographical groups, 1890 and 1900; Table 8 showing, for corporations, the capital as reported at the census of 1900, compared with their capital stock; Table 9 showing the number of wage-earners, men, women, and children, by geographical groups, 1880, 1890, and 1900; Table 10 showing the percentages of men, women, and children of total wage-earners, by geographical groups, for 1880, 1890, and 1900; Table 11 being a comparative summary of miscellaneous expenses, 1890 and 1900; Table 12 showing the quantities of raw cotton produced, imported, exported, and retained for consumption, 1880 to 1900; Table 13 showing, by states, the quantity and cost of domestic cotton, other than sea island, consumed, 1880 to 1900; Table 14 showing the kinds, quantity, and value of products, 1890 and 1900; Table 15 showing the additional value added by finishing processes to products of mills after spinning and weaving, both in cotton mills and in independent establishments; Table 16 showing the amount of yarn spun, coarse, medium, and fine, by states, geographically arranged, 1890 and 1900; Table 17 showing the active cotton spindles in the entire textile industry, by states, geographically arranged, 1890 and 1900; Table 18 showing the spindles in cotton mills, by states, geographically arranged, 1880, 1890, and 1900; Table 19 showing the annual sales of frame spindles from 1890 to 1900; Table 20 showing the number of spindles to each wage-earner and the labor cost per spindle, by states, geographically arranged, 1880, 1890, and 1900; Table 21 showing the classification of looms, by geographical groups, 1890 and 1900; Table 22 presenting, for 1900, the number and capacity of spinning mills, of weaving mills, and of mills which do both spinning and weaving, by states, geographically arranged; Table 23 showing a comparative summary, by states, geographically arranged, 1840 to 1900; and Table 24 showing the detailed statistics of the industry, by states, for 1900. The statistics of the manufactures of cotton small wares are presented in two tables: Table 25 showing a summary of the industry for 1900; and Table 26 presenting the detailed statistics, by states, for 1900.

In drafting the schedules of inquiry for the census of 1900 care was taken to preserve the basis of comparison with prior censuses. Comparison may be made safely with respect to all the general heads of the inquiry except those relating to capital, salaried officials, clerks, etc., and their salaries, the average number of employees, and the total amount of wages paid. Live capital—that is, cash on hand, bills receivable, unsettled ledger accounts, raw materials, stock in process of manufacture, finished products on hand, and other sundries—was first called for at the census of 1890; no definite attempt having been made, prior to that census, to secure a return of live capital invested.

Changes were made in the inquiries relating to employees and wages, in order to eliminate defects found to exist on the form of inquiry adopted in 1890. At the census of 1890 the average number of persons employed during the entire year was called for, and also the average number employed at stated weekly rates of pay, and the average number was computed for the actual time the establishments were reported as being in operation. At the census of 1900 the greatest and least number of employees were reported, and also the average number employed during each month of the year. The average number of wage-earners (men, women, and children) employed during the entire year was ascertained by using 12, the number of calendar months, as a divisor into the total of the average numbers reported for each month. This difference in the method of ascertaining the average number of wage-earners during the entire year may have resulted in a variation in the number, and should be considered in making comparisons.

At the census of 1890 the number and salaries of proprietors and firm members actively engaged in the business or in supervision were reported, combined with clerks and other officials. In cases where proprietors and firm members were reported without salaries, the amount that would ordinarily be paid for similar services was estimated. At the census of 1900 only the number of proprietors and firm members actively engaged in the industry or in supervision was ascertained, and no salaries were reported for this class. It is therefore impossible to compare the number and salaries of salaried officials of any character for the two censuses.

Furthermore, the schedules for 1890 included in the wage-earning class overseers, foremen, and superintendents (not general superintendents or managers); while the census of 1900 separates from the wage-earning class such salaried employees as general superintendents, clerks, and salesmen. It is possible and probable that this change in the form of the question has resulted in eliminating from the wage-earners, as reported by the present census, many high-salaried employees included in that group for the census of 1890. With the exception of several other changes of a minor character in the special features of the schedule, the investigation has been conducted along the lines followed at the census of 1890.

In some instances the number of proprietors and firm members, shown in the accompanying tables, falls short of the number of establishments reported. This is accounted for by the fact that no proprietors or firm members are reported for corporations. The reports for cotton manufactures proper show a capital of $460,842,772 invested in the 973 establishments reporting for the industry. This sum represents the value of land, buildings, machinery, tools, and implements, and the live capital utilized, but does not include the capital stock of any of the corporations. The value of the products is returned at $332,806,156, to produce which involved an outlay of $7,123,574 for salaries of officials, clerks, etc.; $85,126,310 for wages; $21,650,144 for miscellaneous expenses, including rent, taxes, etc.; and $173,441,390 for materials used, mill supplies, freight, and fuel. For the 82 establishments manufacturing cotton small wares, the principal items were as follows: Capital, $6,397,385; salaries, $226,625; wages, $1,563,442; miscellaneous expenses, $462,534; cost of materials used, $3,110,137; and value of products, $6,394,164. It is not to be assumed, however, that the difference between the aggregate of these sums and the value of the products is, in any sense, indicative of the profits in the manufacture of the products during the census year. The census schedule takes no cognizance of the cost of selling manufactured articles, or of interest on capital invested, or of the mercantile losses incurred in the business, or of depreciation in plant. The value of the product given is the value as obtained or fixed at the factory. This statement is necessary in order to avoid erroneous conclusions from the figures presented.

Very respectfully,

S. N. D. North

Chief Statistician for Manufactures.

COTTON MANUFACTURES.

By Edward Stanwood.

Civilized man finds three things absolutely essential to his life and comfort—food, shelter, and clothing. The labor necessary to procure the indispensable articles which represent these wants diminishes as one approaches the equator, and conversely it increases as one passes from torrid to temperate climates and thence onward toward the poles of the earth. Tillage of the soil, the construction of dwellings, and the conversion of skins and furs or of vegetable or animal fibers into clothing, are arts which establish themselves naturally wherever man fixes his abode. The provision of shelter always remains a local art, from the necessity of the case. An adequate supply of fuel, which is a concomitant of shelter, was frequently the first want for which pioneer communities in early times were compelled to provide from without. Next they supplemented their own provision of clothing with fabrics and garments made elsewhere; and finally as population became dense, and labor was drawn from agriculture and was specialized in commerce and manufactures, they were obliged to import their food.

In the sense indicated, the colonists of America were engaged in all the arts necessary to supply their own wants, and among those arts was the manufacture of cloth and of clothing. They were prohibited by the laws of the mother country from carrying on manufactures for purposes of trade and profit, but the household manufacture always existed. A considerable part of their clothing was made from domestic material, spun and woven in their homes, and made up by members of their own families. When Hamilton wrote his great Report on Manufactures, in 1791, he referred to certain branches of the textile industry as already established, yet at that time there was but one cotton factory where spinning was carried on by means of machinery moved by waterpower, and that factory had been established less than a year and had but 72 spindles. There were no woolen mills in the modern sense of the term, but there were many fulling mills where wool was prepared for household spinning.

Although some progress was made during the next twenty years, it was not until the War of 1812 cut off foreign supplies that the cotton manufacture was truly "established." Since that time it has expanded steadily and marvelously. During every decade, not even excepting that which covered the years of the Civil War, there has been an increase in the number of operatives employed and in the quantity and value of the goods manufactured. The census of 1850 showed a total value of products of $61,869,184. Ten years later, in 1860, the value of products had almost doubled, being $115,681,774. In 1870 the value had increased to $177,489,739, a large part of the increase being due to inflation of the currency. The decline to normal price in the ensuing decade masked the actual growth of the industry, and in 1880 the value of products was only $192,090,110. In 1890 the value was $267,981,724; at the census of 1900 it was $339,200,320—five and a half times as much as in 1850, when it was already the leading manufacturing interest in the United States. It was the first, the largest, and the most typical factory industry in the country, and still holds its ranks, almost undisputed, in all these respects.

The growth of the industry is sufficient proof, were such proof needed, that it has been profitable. Nevertheless it has been subjected to many and sometimes protracted seasons of discouragement and loss. The margin between the price of a pound of raw cotton and that of a pound of goods, whether yarn or cloth, is, in the face of the keen competition which exists, so small that the profits of a mill during a whole year may depend upon the luck or judgment of the treasurer in buying his raw material at the right or the wrong season, which in turn largely depends upon his skill or his fortune in forecasting a large or a small cotton crop. So far as that were the case, what one treasurer might lose another treasurer would gain, and the ultimate effect upon the profits of the industry as a whole would be *nil*. But the fact of a large or a small cotton crop makes an enormous difference in the profits of manufacturers. The general condition of the country determines the demand for goods, and consequently the price; but the cost of production depends greatly upon the price of cotton. Cheap cotton and a quick demand make the manufacture profitable; dear cotton, a sluggish rate of consumption, and labor troubles reduce or extinguish profits. Unfortunately the latter set of conditions is too often presented. Fortunately it is not usually met in so virulent a form as to cause actual loss, and the situation does not ordinarily last long.

Upon the whole, the history of the past ten years was not one of prevailing prosperity. Two influences interfered to reduce profits—an extremely wide fluctuation in the price of cotton, and the great increase of competition caused by the growth of the industry in the Southern states. The first of these influences was general in its application; the other applied to Northern mills only. The new Southern mills, equipped with the most efficient machinery, favored by peculiarly free conditions as to labor, chiefly engaged in the production of goods for which the demand was most steady, and helped not a little by close proximity to the field of supply of their raw material, were able to show constant and large profits; whereas their Northern competitors passed through seasons of no profit or of moderate gains, with only one or two periods when their business was eminently satisfactory.

The condition throughout the census year 1889–90 was highly favorable to manufacturers, and they made extraordinary profits. Barely 1 per cent of the cotton spindles in the country was idle, and most of those were so because they were antiquated and not worth running. But a rise in the price of cotton, from 10 cents a pound in January, 1890, to 11½ cents in April, brought discouragement, because a slackened demand for goods compelled a reduction in the price of cloth at the same time that the cost of producing it was increased. The change to unfavorable conditions was felt first in the great print-cloth center, at Fall River, where a stoppage of the mills and a general curtailment of production became necessary in August. Other branches of the cotton manufacture continued fairly profitable for a few months longer, but before the end of the year all branches were depressed. There was, nevertheless, a somewhat speedy recovery; an improvement set in quite early in the spring for all except print cloths, which continued to be weak. There was an extraordinary fall in the price of cotton, owing to the prospect of a large crop, from 12¾ cents in May, 1891, to 8 cents in June. Notwithstanding this favorable turn of the market, the Northern mills felt the first check to prosperity, owing to Southern competition. Again in September of that year it became necessary both to curtail production by the Fall River mills and to reduce wages. This time the means taken were effectual. Stocks were worked off and the market demand became strong. Accordingly the year 1892 was one of the good years of the industry. No complaints were heard from any part of the country.

In 1893 there was once more a reverse. Cotton manufacturing in England, which had been in an extraordinarily depressed state in 1892, now became prosperous, whereas in the United States it was dull and unsatisfactory. In August there were strikes and closing of mills, and the unfavorable conditions continued throughout the year 1894. No doubt apprehension by manufacturers of tariff legislation less favorable to their interests than the existing import duties went far to create the difficulties with which they contended. The passage of the act of 1894, however, did no injury to the interests of the manufacturers, and the industry revived, and was in a prosperous condition in 1895. Stocks were small, prices were fair, and although cotton was higher, the results of the year were remunerative. This was brought about because mills were well provided with stocks of low-priced cotton of the 1894 crop, and the prospect of a short crop in 1895 gave tone to the market for cloth. Orders were large, prices advanced, machinery was in full operation, and the year 1895 ended with excellent prospects of a continuance of prosperity.

These prospects were not realized. Early in 1896 the market demand began to decline, and as the machinery continued in operation, goods accumulated. The situation became such that in June, efforts were made by means of auction sales of large stocks of goods to reduce the surplus. There was also the suggestion that there be once more an organized curtailment of production, which was not carried out. The attempt to work off the surplus goods was successful, and the prospects of manufacturers brightened to a certain extent, but it was soon discovered that the market had been choked. Cotton advanced in price, narrowing the margin between the cost of raw cotton and the selling value of finished goods, and the demand was not great enough to absorb the output of the largely increased number of mills. The depression that existed in 1896 was due to the agitation and uncertainty that always prevail in a year of Presidential election, which were in this instance more acute than usual. But the peculiar situation of the two markets that determine the financial result of a cotton manufacturer's operations prolonged the depression, and continued it after other branches of business had begun to experience the great prosperity that marked the closing years of the century. Many mills were shut down in May and June, 1897. Renewed sales of goods by auction in the spring broke prices and demoralized the market, as well as reduced to petty proportions the demand for goods of current manufacture. There was another curtailment of production, then a great drop in the price of cotton; but the quick absorption of goods, owing to the generally prosperous condition of the people, rectified the situation altogether, and manufacturers entered upon a somewhat prolonged period of great prosperity. The only interruption was in the print-cloth branch, which was in a very unfavorable condition at Fall River in 1898, and the average return upon capital by the mills of that city for the year was only 2.2 per cent. But prosperity came to Fall River also during the year 1899, beginning about the month of March, and during the whole of the census year, from June, 1899, to June, 1900, all the mills of the country were fully occupied. Goods were produced from cotton costing within a fraction of the lowest on record, and although they were sold at prices which were low as compared with the average for any five years in the past, yet they yielded a profit which, taking the country as a whole, has never been exceeded.

It must always be borne in mind that the foregoing statements apply more particularly to establishments and to the conditions of trade in the manufacturing centers of the North. Prior to the close of the census year there had been scarcely any interruption of the exceeding prosperity of Southern spinners. They did not curtail production when many Northern manufacturers were in a state bordering upon despair; on the contrary, a large number of their mills were running day and night. They did not seek to dispose of their product by auction, but sold all they could make at prices which gave their stockholders handsome dividends.

THE FOREIGN TRADE IN COTTON GOODS.

It is further to be noted in this connection that for the first time in the history of American cotton manufacturing, the domestic market was more than once relieved and steadied by the exportation of goods to foreign markets. This statement does not signify that the export of domestics is a new thing, for it was a feature of the American foreign trade eighty years ago, but that for the first time the existence of an important outlet for such goods saved manufacturers from a disastrous glut, and mitigated the keenness of the competition that became most serious when the South entered the market as a great producer.

The history of the trade of the United States in cotton goods presents some peculiarities which distinguish it from the trade in any other class of articles. In a broad sense the cotton manufacturers have possessed the home market for three-quarters of a century. Nevertheless, in the intervening years there has been a large and important import trade. The seeming paradox disappears when the first of the following tables is critically examined. The imports consist mostly of goods which American manufacturers have never undertaken to produce on a large scale. An overwhelming proportion of the manufactures of cotton consumed in this and other countries consists of plain cloth woven from coarse or medium yarns. Save in a few exceptional years, the American manufacturers have been able to supply fully the demand for such goods. Meanwhile the arrangement of the tariff has been usually such that foreign manufacturers were not permitted to compete successfully in this market.

Table 1 shows the annual imports of manufactures of cotton from 1821 to 1900, inclusive, as compiled from the annual reports on Commerce and Navigation, published by the United States Treasury Department.

TABLE 1.—ANNUAL IMPORTS OF MANUFACTURES OF COTTON, 1821 TO 1900, INCLUSIVE.[1]

YEARS.	Total value.	CLOTHS. Bleached and unbleached.		CLOTHS. Printed, painted, and colored.		Value of clothing, ready-made, and other wearing apparel, not including knit goods.	Value of embroideries, laces, insertings, trimmings, and lace curtains, cords, and gimps.	Value of knit goods made on knitting machines or knit by hand.	THREAD (NOT ON SPOOLS), YARNS, WARPS, OR WARP YARNS.		JEANS, DENIMS, AND DRILLINGS.		All other manufactures.
		Square yards.	Value.	Square yards.	Value.				Pounds.	Value.	Square yards.	Value.	Value.
Total.	$91,972,247		$29,300,792		$52,709,603			$5,422,605		$1,881,685			$2,657,562

[1] Includes "bleached."

Table 1 shows that from 1821 to 1855 the value of plain, uncolored cotton cloth imported exceeded $4,000,000 in a single year only, the year 1831; and that the annual average value of such goods imported declined from $2,930,079 in the decade 1821–1830, to $2,106,502 in the decade 1831–1840, and to $1,667,429 in the decade 1841–1850. Except during the three years 1855–1857 the importation was not materially greater during the ensuing decade; and notwithstanding the great advance of the country in population and wealth, the annual average value of the same class of goods in the years 1891–1900 was but $183,142. This class consists of fabrics which are reported by the census as plain cloths for printing and converting, sheetings and shirtings, duck, etc., the value of the domestic production of which is so large that the foreign importation is undoubtedly less than 2 per cent of it.

The same table shows that the average value of the imported cloths per square yard is much above the value of the domestic article. This is because the importation is confined almost exclusively to fine goods, which American manufacturers have only lately begun to produce. Another class of importations which is larger than that already mentioned is colored goods. Some purchasers have so rooted a preference for foreign ginghams and calicoes that they will not buy the American product. The imports of such goods have lately shown a tendency to increase, but the value of colored cloth imported in 1900, when the amount was the largest in recent years, was little more than twice the annual average from 1860 to 1883. The most important importations of cotton are the fancy articles, classed as embroideries, laces, trimmings, cords, gimps, etc., which, with knit goods, constitute more than one-half of the total value of all articles of cotton imported. In short, the trade in foreign manufactures of cotton is almost altogether in special classes of goods which are not made extensively in the United States, or in articles which the customs and habits of buyers lead them to prefer, regardless of considerations of cost or superiority.

Table 2 shows the annual exports of cotton manufactures from 1826 to 1900, inclusive, as compiled from the annual reports on Commerce and Navigation published by the United States Treasury Department.

[1] Annual Reports on Commerce and Navigation, United States Treasury Department.

Table 2 shows that the exportation of cotton goods has been a feature of the foreign trade for more than seventy-five years. It is impossible to go further back than 1826, because the separate values of articles exported were then reported for the first time. The trade was established soon after the foundation of the modern factory industry, at Waltham, Mass. It became prominent when that first great success was followed up in the development of Lowell. As early as 1851 the annual value of cotton goods exported exceeded $7,000,000; and it is safe to say that this amount represented more than one-half of the total value of American manufactures of all kinds sent to foreign countries in that year. The year 1860 marked the temporary culmination of this trade, when the declared value of cotton manufactures exported was but a trifle less than $11,000,000. The Civil War ensued and not only this branch of the foreign trade, but the cotton trade itself also, was well-nigh annihilated for several years.

When the growth of the cotton crop was resumed, the United States had lost its foreign markets, had given up its shipping formerly engaged in the foreign trade, and had closed most of the mercantile houses in other lands which had previously given its merchants access to the markets of Asia, Africa, and South America. Moreover, the extraordinary increase of population and of wealth at home, and the great demand for cloth to replenish family supplies exhausted during the war period, gave manufacturers ample field for their enterprise in supplying the home consumption. In these circumstances scarcely any attempt was made to recover foreign markets. The exportation declined to a value of less than $1,500,000 in 1864, and from 1866 to 1876, eleven years, the annual average was barely $4,000,000. From 1877 onward there was a moderate revival of the trade. In only five years in the last quarter of a century, 1877 to 1902, has the value fallen below the high mark of 1860, and on the whole there has been steady progress. The following table shows the value of exports of cotton goods in five-year periods:

PERIOD.	Total exports.	Yearly average.
1877–1881	$56,615,219	$11,323,044
1882–1886	65,231,718	13,046,324
1887–1891	61,759,309	12,251,862
1892–1896	70,003,724	14,000,745
1897–1901	105,904,189	21,180,838

The exportation during the census years of the last half century has been as follows: In 1860, $10,934,796; in 1870, $3,787,282; in 1880, $9,981,418; in 1890, $9,999,277; and in 1900, $24,003,087. These figures do not show the actual progress so well as the preceding table, inasmuch as the exportation in 1880 and again in 1890 was less than during the years preceding or following those dates. The exportation in 1900 was the largest on record in declared value, although in the quantity of goods it was not so great as in 1899.

It was not possible, of course, to account for all the exports declared upon the clearing of vessels for foreign ports, since a considerable part of the domestics sold abroad are made for the home market and are purchased for sale in other countries after they have passed wholly out of the control and the knowledge of manufacturers; but so far as the managers of mills are able to trace their products, they furnished goods for export during the year 1899–1900 to the value of $15,357,502, or about five-eighths of the value of cloth exported during the fiscal year. Almost 60 per cent of the total value represents the product of Southern mills, and nearly 37 per cent the goods of New England. It is an interesting fact that South Carolina, which was historically and politically, during the years preceding the Civil War, the most conspicuous champion of a policy favorable to the exportation of raw cotton, upon which the planters most relied, and opposed to the fostering of manufactures of cotton, spun in its own mills in 1900 a quantity of cotton exceeding the half of its own crop, and exported close upon one-half of all the cotton cloth reported to the census as having been dispatched to foreign countries. The exact percentage of South Carolina of the total export reported was 45.5.

Table 3 shows the annual exports of foreign manufactures of cotton goods from 1821 to 1900, inclusive, as compiled from the annual reports on Commerce and Navigation published by the United States Treasury Department. It is presented only for the purpose of furnishing the means of ascertaining—by subtracting the amounts and values from the corresponding statistics in Table 1—the actual consumption of foreign goods.

TABLE 3.—ANNUAL EXPORTS OF FOREIGN MANUFACTURES OF COTTON, 1821 TO 1900, INCLUSIVE.[1]

[1] Annual Reports on Commerce and Navigation, Uuited States Treasury Department.

THE GENERAL PROGRESS OF THE INDUSTRY.

Table 4 presents the summary of the cotton manufacture from 1840 to 1900, inclusive. The figures for 1900 do not include the manufacture of cotton small wares, which branch of the industry has been separately treated at the Twelfth Census, and is made the subject of a special chapter at the conclusion of the report on cotton manufactures.

TABLE 4.—COMPARATIVE SUMMARY, COTTON GOODS, 1840 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

	DATE OF CENSUS.							PER CENT OF INCREASE.

[1] Decrease.
[2] Includes proprietors and firm members, with their salaries; number only reported in 1900, but not included in this table. (See Table 24.)
[3] Not reported separately.
[4] Not reported.

The classification of cotton goods applies in all the statistics for the Twelfth Census to results in those establishments only in which the chief industry is the spinning of cotton yarn and the weaving of piece goods—one or both. The designation of cotton small wares applies to establishments chiefly engaged in the manufacture of the following classes of articles: Shoe and corset lacings, lamp and stove wicks, tapes, webbings (other than elastic), lace edgings, dress and upholstery trimmings.

In order to preserve the basis for comparison with statistics of former censuses, Table 5 combines the statistics for cotton manufactures and cotton small wares for 1900, and shows the percentage that each is of the total.

Table 5 shows that the totals for capital, wages, cost of materials, and value of products for cotton small wares represented about 2 per cent of the totals for the entire cotton manufactures, and for the number of establishments about 8 per cent.

At the census of 1890 the average capital for the 905 establishments, which included both cotton goods and cotton small wares, was $391,182. In 1900 for the 1,055 establishments of both classes the average capital was $442,882; for the 973 establishments reported as cotton goods only it was $473,631; and for the 82 classified as cotton small wares it was $78,017.

TABLE 5.—COMBINED SUMMARY, COTTON GOODS AND COTTON SMALL WARES: 1900, WITH PERCENTAGE THAT EACH ITEM IS OF TOTAL.

	Total.	Cotton goods.	Cotton small wares.	PER CENT OF TOTAL.	
				Cotton goods.	Cotton small wares.

Women, 16 years and over	126,882	123,709	3,173	97.5	2.5
Wages	$33,746,665	$32,917,933	$828,732	97.5	2.5
Children, under 16 years	40,258	39,866	392	99.0	1.0
Wages	$5,348,206	$5,285,012	$63,194	98.8	1.2
Miscellaneous expenses	$22,112,678	$21,650,144	$462,534	97.9	2.1
Cost of materials used	$176,551,527	$173,441,390	$3,110,137	98.2	1.8
Value of products	$339,200,320	$332,806,156	$6,394,164	98.1	1.9
Active spindles, number	19,050,952	19,008,352	42,600	99.8	0.2
Looms, number	455,752	450,682	5,070	98.9	1.1
Cotton consumed, bales	3,646,708	3,639,495	7,213	99.8	0.2
Cotton consumed, pounds	1,817,643,390	1,814,002,512	3,640,878	99.8	0.2

With this general explanation of the new system of classification, it will be understood that all the tables hereafter given, except Table 23, make the comparison between cotton goods alone in 1900 and cotton manufactures generally prior to this census. It is believed that the slight difference of 2 per cent will not seriously impair their general usefulness for purposes of comparison or may be allowed for by those who desire more exact figures.

GEOGRAPHICAL DISTRIBUTION OF THE INDUSTRY.

The following tabular statement will bring to light the most interesting and the most important fact relating to the growth of the cotton-manufacturing industry during the decade 1890–1900:

SECTIONAL DISTRIBUTION OF ESTABLISHMENTS.

GEOGRAPHICAL DIVISIONS.	1900	1890	1880
New England states	332	402	439
Middle states	225	239	139
Southern states	400	239	161
Western states	16	25	17
Total	973	905	756

The decrease in the number of establishments in the New England states is more apparent than real. It results partly from the elimination of certain mills from the classification as "cotton manufactures," already mentioned, and partly from the consolidation of establishments under one management. The same reasons account fully for the decline in the number of establishments in the Middle states: New York, New Jersey, Pennsylvania, Delaware, and Maryland. The manufacture has never existed on a considerable scale in the Western states. Comparative distance and inaccessibility with respect to the supply of raw cotton, distance from the commercial cities which are the headquarters of the dry goods trade, and difficulty in procuring the requisite trained labor—these and other causes have hitherto rendered the West an undesirable location for cotton mills, which need for economical operation cheap transportation of raw material, cheap fuel or unfailing waterpower, and nearness to large markets. The cotton manufacture, moreover, is essentially gregarious, and enjoys the greatest prosperity where it is carried on by large establishments or by large groups of small mills.

The growth of the industry in the South is the one great fact in its history during the past ten years. It will be seen that in 1880 there were, in that part of the country, 161 establishments only which made reports to the census; in 1890 there were only 239, an increase of 78, or 48.4 per cent; and in 1900 there were 400 separate establishments, an increase from 1890 of 161, or 67.4 per cent. A scrutiny of the returns by states shows that substantially the whole increase in the South has been in the 4 states of North Carolina, South Carolina, Georgia, and Alabama. The number of establishments in these 4 states was 119 in 1880, 191 in 1890, and 355 in 1900. In the other states of the Southern group the number was 42 in 1880, 48 in 1890, and 45 in 1900.

It would be revealing but a part of the truth to rest the statement of Southern industrial expansion upon the number of establishments; for in the decade 1880–1890 the number of spindles in the four leading Southern states increased almost twofold, from 422,807 to 1,195,256; and the average number of spindles to a mill increased from 3,553 to 6,258. In the decade from 1890 to 1900 the progress has been at an even greater ratio, although the basis of the calculation is larger, for the total number of spindles is 3,791,654, the numerical increase 2,596,398, the percentage of increase 217, and the average number of spindles to a mill has become 10,651. The subsequent tables in this report will give abundant evidence of the expansion of the Southern cotton industry in all directions—in capital, consumption of material, employment of labor, and quantity and value of product.

Speaking broadly, the cotton manufacturing industry did not exist in the South before the Civil War, and it existed only on the most restricted scale before 1880. There are now single establishments in Massachusetts which pay annually a larger sum in wages than the entire cost of labor in Southern cotton mills in 1880. The mills were small, equipped with antiquated machinery, engaged in spinning the coarsest numbers only, and in producing from cotton grown in the neighborhood the stout fabrics used for clothing by the negroes. It is probably not an exaggeration to say that prior to 1880 there was not a mill south of the latitude of Washington that would be classed as an efficient modern cotton factory, even according to the standard of that time. Before the Civil War the people of the South were almost exclusively engaged in agricultural pursuits. The ruling classes looked with disfavor upon manufactures and discouraged the introduction of the industrial arts save as they were necessary to meet local wants.

After the war closed it was some years before the people had recovered sufficiently from the disaster to undertake manufacturing. There had been attempts in the direction of cotton spinning and weaving before 1880, but the cotton exposition in Atlanta, in 1881, gave the industry an impetus which it has never since lost. The possibilities of the region were shown when the governor of Georgia appeared at the fair dressed in a suit of clothes made of cottonade manufactured on the grounds from cotton which had been picked from the stalk on the morning of the same day, in the sight of the visitors to the fair. That the local product of cotton could be worked up into finished cloth without transportation to a distant manufacturing town, together with the fact that the region had abundance of unemployed labor of a class similar to that which in the early days operated the mills of Waltham, Lowell, and

Manchester, brought before the people the vision of a new source of individual and public wealth to which they had previously been blind.

Once the opportunity had been presented to them the chance was eagerly seized, and all who were able to do so contributed to make the new enterprise successful. The press urged it upon those who had capital to invest, hailed joyfully every manufacturing project, and made much of every successful establishment. Municipal aid was given in the shape of exemption from taxation for a term of years. The railroads favored the scheme by arranging their freight schedules so as to encourage Southern manufacturers. The factories first established under the new régime showed large profits, and thus attracted more capital to the new industry. The advantages of the Southern country for cotton manufacturing began to attract attention in the North; and in many cases corporations already established increased their capital and built new mills in the South Atlantic states.

The earliest Southern enterprises were not in all cases begun as first-class establishments. Some of them were equipped with discarded machinery from Northern mills. But the manufacturers quickly learned the lesson that there is no industry in which profits are more directly proportioned to the perfection and speed of the machinery than in the spinning and weaving of cotton; and the old spindles and looms were speedily replaced with others of the newest pattern. A great proportion of the mills built and started within the past decade have been thoroughly up to date in all respects. In fact some improvements in mill construction are to be found in that section, which are not yet introduced in the manufacturing regions of the North. The first factory operated wholly by electricity, without shafting or belts, was located in the South, and until near the time of the writing of this report it was the only factory so equipped. By the use of electrical power it is possible to place the mill on high ground at a suitable distance from mill race and water wheel, and thus to secure accessibility, the health of operatives, and other benefits which could not be enjoyed when it was necessary to put the foundations of the mill below the foot of the waterfall.

The growth of the manufacturing industry in the South has been fairly continuous during the past ten years. How large it has been the figures show. For the most part the product of the region has been coarse or medium goods, as is usually the case in the early stages of the industry. But not a few mills have been constructed to make yarns of the higher medium numbers and cloth which approaches the lower limit of those classed as fine. A considerable part of the product of the region is exported. The industry is now important enough in the 4 states of North Carolina, South Carolina, Georgia, and Alabama to consume nearly one-third of the crop of cotton grown in those states; and both North Carolina and South Carolina spin more than half the cotton grown within their limits.

The growth of the industry in the South has been remarkably steady. As is commonly the case with enterprises of this nature, it has been attended with not a little public excitement; more mills have been projected than have been built; some have been erected which their projectors would not have erected had they studied the matter carefully before entering upon the experiment. But the failures have been few, and upon the whole the return upon investment in Southern cotton mills has greatly exceeded that upon factories in the North. The fact that after a phenomenal growth during more than twenty years the expansion of old mills and the erection of new ones are still going on in the South is ample proof of the success of the enterprise.

The following table, made up from files of the New York Commercial and Financial Chronicle, presents a view of the annual increase in the number of spindles in the states south of the District of Columbia during the past twenty years. The Chronicle is recognized as among the best authorities upon the cotton crop and its distribution. Its statements for the first few years of the period covered were admittedly estimates; but from the year 1888 they are based upon actual returns from the Southern mills made directly to the Chronicle. For the census years, the census figures are substituted.

SPINDLES IN SOUTHERN MILLS, AND THEIR CONSUMPTION OF COTTON.

YEARS.	Number of spindles.	Bales of cotton used.
1880-81	610,000	205,000
1881-82	680,000	238,000
1882-83	860,000	331,000
1883-84	1,100,000	334,000
1884-85	1,150,000	266,000
1885-86	1,200,000	340,000
1886-87	1,225,000	397,929
1887-88	1,177,901	443,373
1888-89	1,344,576	486,603
1889-90	1,554,000	526,856
1890-91	1,756,047	605,916
1891-92	1,938,524	681,471
1892-93	2,082,197	733,701
1893-94	2,167,242	723,329
1894-95	2,379,281	853,352
1895-96	2,770,284	915,810
1896-97	3,197,545	1,024,482
1897-98	3,574,754	1,227,939
1898-99	3,832,201	1,400,026
1899-1900	4,298,188	1,477,775

Although there has been a surprising growth of the industry in the Southern states, yet it still remains true, as it has been true ever since Samuel Slater set in motion the first spindles operated by power in this country at Pawtucket, R. I., in 1791, that the largest and densest concentration of cotton manufacturing in the United States is in southern New England. A list is printed in the American State Papers[1] of the cotton mills within 30 miles of the town of Providence,

[1] Finance, Vol. III.

R. I., in November, 1809. The mills are enumerated in the chronological order of their establishment, beginning with the Pawtucket mill of Almy, Brown & Slater. Twenty-seven mills are mentioned as having in the aggregate 20,406 spindles "now in operation," but as having, including these, 34,900 spindles "which might be employed." There were also 14 other mills, all established in 1809, with 23,600 spindles, which were evidently not yet in operation. One mill, a Titan for those times, contained 10,000 spindles. The average of the 41 factories, counting their greatest capacity, was less than 1,500 spindles, and all combined they did not greatly exceed the average of one Fall River mill of the present time; yet they constituted the greatest concentration of the industry as it existed ninety years before the Twelfth Census was taken. In the year 1900 there were, within the same area, 7,209,235 spindles, as is shown by the following table:

TABLE 6.—NUMBER OF SPINDLES IN COTTON MILLS WITHIN 30 MILES OF PROVIDENCE, R. I.

LOCATION OF ESTABLISHMENTS.	Producing spindles (not including twisting, or doubling spindles).
Total	7,209,235
Brooklyn, Windham county, Conn	59,864
Killingly, Windham county, Conn	85,808
Plainfield, Windham county, Conn	74,736
Putnam, Windham county, Conn	106,800
Thompson, Windham county, Conn	111,688
Woodstock, Windham county, Conn	1,200
Voluntown, New London county, Conn	16,500
Bristol county, Mass	4,561,129
Blackstone, Worcester county, Mass	43,548
Grafton, Worcester county, Mass	62,344
Northbridge, Worcester county, Mass	89,264
Oxford, Worcester county, Mass	5,600
Sutton, Worcester county, Mass	54,496
Uxbridge, Worcester county, Mass	11,172
Webster, Worcester county, Mass	81,000
Bristol county, R. I	102,104
Hopkinton, Washington county, R. I	20,194
Kent county, R. I	472,406
Newport county, R. I	43,008
Providence county, R. I	1,206,374

In round numbers one-third of all the spindles in the United States are in the factories within that small area. It was remarked in the report on the Eleventh Census that 29.61 per cent of all the cotton spindles were operated in the two adjoining counties of Bristol, Mass., and Providence, R. I. The percentage has been maintained. It is now 30.3, and it greatly exceeds that of any other two counties. Indeed, the spindles of Providence county, the smaller of the two, outnumbered those of any Southern state except South Carolina. But the percentage of New England as a whole has suffered a considerable decline. In 1870 these six states had 77 per cent of all the spindles; in 1880 they had 81 per cent; in 1890 there was a decline to 76 per cent; and the percentage in 1900 was but 67.6.

CAPITAL.

Table 7 is a comparative summary, by geographical divisions, of the capital invested in the cotton manufacture in 1900, compared with 1890, with percentages of increase for the decade.

Table 7 shows that the total capital employed has increased 30.2 per cent. Taking the country as a whole, there is a small decrease in the reported value of the land. This is explained by the fact that in a great number of cases the land upon which factories are placed has but a nominal value; indeed, it had scarcely any value before the factories were erected and would be wholly unsalable if the buildings were removed. In these circumstances the officers making returns can only estimate the value, and estimates made at intervals of ten years may be expected to vary. There appears to have been an absolute decrease in the value of land in New England attached to cotton-manufacturing establishments; and the increase in land value in Southern states is 30.8 per cent, although the whole value of the plant has increased 131.4 per cent.

TABLE 7.—COMPARATIVE SUMMARY, COTTON GOODS, CAPITAL, BY GEOGRAPHICAL DIVISIONS, WITH PERCENTAGES OF INCREASE: 1890 AND 1900.

GEOGRAPHICAL DIVISIONS.	Year.	Total.	Land.	Buildings.	Machinery, tools, and implements.	Cash and sundries.
United States	1900	$460,842,772	$22,546,549	$91,621,757	$181,009,280	$165,665,186

[1] Decrease.

In view of the current discussion as to the capitalization of corporations it becomes interesting to note that the objections to the practice of overcapitalization can not justly be urged against cotton-manufacturing establishments. The form of ownership of such establishments is to a remarkable degree the corporate. Of the 973 separate establishments here reported, 708 are classed as corporations, 142 are individual, and 123 are partnerships or firms. Even this does not show the actual situation definitely, since 56 of the individual and 68 of the partnership establishments in Pennsylvania, and most of them in the city of Philadelphia, are weaving factories only, and individually of moderate importance. Outside of Pennsylvania there are 678 corporations, 86 individual, and 55 partnership establishments. With reference to the two latter classes, there can, of course, be no question of overcapitalization. The capital they report is simply that employed in their business. But the incorporated companies have a share capital to an amount specified in their respective charters. Table 8 shows, by geographical groups, the capital for corporations as reported at the census of 1900, compared with the nominal capital of corporations as represented by their capital stock.

TABLE 8.—COMPARISON OF CAPITAL OF CORPORATIONS, AS REPORTED AT CENSUS, WITH CAPITAL STOCK, BY STATES AND GEOGRAPHICAL DIVISIONS: 1900.

STATES.	Capital as reported at census.	Capital stock.
United States	$385,863,827	$204,157,914
New England states	238,502,315	128,703,500
Maine	20,974,669	11,630,000
New Hampshire	28,713,786	17,725,000
Vermont	1,696,331	1,050,000
Massachusetts	135,873,779	71,088,500
Rhode Island	30,466,097	15,367,000
Connecticut	20,777,653	11,843,000
Middle states	33,521,797	15,205,000
New York	12,455,548	5,046,000
New Jersey	12,503,262	5,145,000
Pennsylvania	5,314,968	2,734,000
Maryland	3,248,019	2,280,000
Southern states	109,589,031	57,101,352
Virginia	4,338,206	2,886,700
North Carolina	25,840,465	14,364,500
South Carolina	36,275,727	17,835,200
Georgia	21,826,464	10,874,952
Kentucky	1,867,605	1,325,000
Tennessee	3,105,095	1,634,000
Alabama	10,509,595	5,300,000
Mississippi	2,199,249	1,231,000
Arkansas	249,828	200,000
Louisiana	1,716,688	850,000
Texas	1,660,109	600,000
Western states	4,250,684	3,148,062
Ohio	56,692	25,000
Indiana	1,532,586	800,000
Illinois	831,047	600,000
Wisconsin	455,235	375,000
Missouri	165,500	248,062
Nebraska	190,819	150,000
Colorado	647,805	250,000
California	371,000	800,000

NOTE.—In the foregoing table the nominal capital stock reported of the companies now united in the three industrial combinations is that of the separate companies before the amalgamation. The present capital stock is larger by $15,200,000, and the total capital stock for the whole country is $219,357,914. The addition can not conveniently be shown by states, inasmuch as the plants of two of the three combinations are located in several states. Moreover, the three industrial combinations have issued an aggregate amount of $26,500,000 bonds.

It appears from Table 8 that not only in the United States as a whole, and in each of the geographical divisions, but in every individual state, except Missouri and California, the actual invested capital exceeds the par value of the share capital. Undoubtedly a considerable amount, many millions of dollars in the aggregate, of the capital reported to the census represents borrowed money; but after making the largest reasonable allowance for this item there must remain an excess of at least 25 per cent of assets over the nominal value of the share capital. Very few cotton-manufacturing establishments have a bonded debt.

In this connection it may be remarked that the system of industrial combination, commonly known as the "trust," has not seriously invaded the cotton-manufacturing industry. There were in 1900 only three such combinations: The New England Cotton Yarn Company, which produces but a small fraction of the yarns made for sale; the Mount Vernon-Woodberry Cotton Duck Company, which produces a considerable part of the sail duck made in the country; and the American Thread Company, which has combined several of the large establishments which produce sewing thread. The total value of the plants and miscellaneous items of capital of all the establishments controlled by these three industrial combinations is $31,077,609. Their combined capital stock is $33,000,000, and the total of their bonded debt is $26,500,000.

EMPLOYEES AND WAGES.

In 1900 the average number of employees in the cotton industry (excluding cotton small wares), including officers and clerks, was 302,642, an increase of 81,057, or 36.54 per cent over the total for cotton goods and cotton small wares in 1890. Of this increase more than 60,000, or three-fourths of the whole, were in the Southern states. The figures which show the number and compensation of officers, clerks, and superintendents require no discussion. They are useful merely for the completion of the statistics and to bring out in its true light the magnitude of the industry. The real interest lies in the facts regarding those who are more strictly classified as wage-earners, the operatives in the mills. The importance of the figures relating to them is enhanced by the circumstance that the cotton-manufacturing industry is typical of the factory system in its highest form and on the largest scale. There is scarcely another industry that approaches it in the numbers of hands employed within mills; and the numbers of men and women employed are more nearly equal than is the case with any other industry of a magnitude to be compared with this.

Table 9 shows the number of wage-earners, men, women, and children, by geographical divisions, at the censuses of 1880, 1890, and 1900; and Table 11 shows the percentages of men, women, and children of total wage-earners, by geographical divisions, for 1880, 1890, and 1900.

TABLE 9.—COTTON GOODS, WAGE-EARNERS, AVERAGE NUMBER OF MEN, WOMEN, AND CHILDREN, BY GEOGRAPHICAL DIVISIONS: 1880 TO 1900.

Western states	34.4	30.4	26.3	56.6	56.4	52.0	9.0	13.2	21.7

Tables 9 and 10 show that of the men, women, and children employed, first, the actual numbers of each class have increased during the past ten years, and, second, the number of men has increased much more rapidly than the number either of women or of children.

In the whole country there has been a numerical increase from 1890 to 1900 of 45,517 men, of 17,102 women, and of 16,434 children. There was an increase in the number of men in every section; a very slight decrease in the number of women in every division except the Southern states, and an increase in the number of children in the South, whereas in the rest of the country the number was nearly stationary. Since, in an expanding industry, the numbers of all classes ought to increase, a better medium for the sociological study of the condition of affairs is afforded by the second table, from which it appears that there is now for the first time a preponderance of the proportion of men employed, over the women. The proportion of men for the whole country increased from 40.6 per cent in 1890 to 45.1 per cent in 1900; the proportion of women declined from 48.7 per cent in 1890 to 41.5 per cent in 1900; the proportion of children advanced from 10.7 per cent to 13.4 per cent.

The returns for the Tenth Census afford the means of discovering that with a slight modification the readjustment of labor conditions has been going on for at least twenty years. Between 1880 and 1890 there was an increase of 6 men in every group of 100 mill operatives. The number of women in the group remained unchanged, owing to the partial discontinuance of the practice of employing children in all parts of the country except the South. In the mills of New England, which then formed a larger fraction of the total than they do now, the number of children in mills was reduced from 14 in every 100 to 7. Between 1890 and 1900 occurred the marvelous expansion of the industry in the South, with the usual result of such an event, a great demand for labor and the employment of whole families. The proportion of children was slightly increased there, by 1 in 100, but the proportion of women diminished by 8, and that of men increased by 7, in each 100. In New England the proportion of men increased 5, that of women decreased 5, in each 100, and the proportion of children remained stationary.

The important fact resulting from an examination of all these proportions is that the tendency is more and more to the employment of men, which, looking at the matter from the social point of view, is highly desirable, in that it diminishes the use of the labor of women in factory service, and doubly desirable in discontinuing the employment of child labor. In this last respect reform has not yet reached the Southern mills, where the supply of labor is not equal to the demand. But the evils of the system of employing children are fully recognized, an agitation for its abandonment is in progress, and no doubt the coming decade will see a substantial diminution of it.

The explanation of the generally increased employment of men is obvious. The chief reasons are two: First, that the operation of some of the modern machines requires the care of men, because it is beyond the physical and nervous capacity of women. For example, the improved high-speed and automatic looms, many of which are put under the charge of one weaver, can be operated most efficiently by men. Moreover, there has undoubtedly been a decrease in the number of women employed as mule spinners. The second cause of the change in the relative proportion of men and women, which, for reasons presently to be stated, is largely influential in the North, is itself a result of a generally improved condition of labor. Whereas formerly it was the custom for an entire family, or, at least, several of its members, to be employed in a mill, the father now earns enough to relieve the mother and some of the children of the necessity of going into the factory; or, perhaps, the mother and the elder daughters find other employment in the shops and offices which manufacturing industry attracts to a community. It is not suggested that the change is one universally to be observed. Possibly the tendency is so slight that the fact of such a change going on can be discovered only when the statistics are studied in a large way. Nevertheless, the cases are sufficiently numerous to justify the assignment of this as one cause of the gradual change that is taking place in the proportion of men and women in the industry as a whole.

The change has not yet perceptibly affected the South. There the labor conditions are different. The industry is growing at a wonderful rate. The help employed is chiefly local. Whole families in that region enter the factories, because in no other way can the demand for labor be satisfied. Consequently the changes in the proportion of men, women, and children employed are largely fortuitous. Roughly speaking, there were three times as many men, twice as many women, and nearly three times as many children employed in Southern mills in 1900 as there were in 1890. The numerical increase was 28,011 men, 17,445 women, and 15,623 children. Manufacturers took whom they could get for operatives in the new mills. The employment of children was not a matter of choice but of necessity, and, economically, is a losing rather than a profitable system; for more than the saving in the dollars and cents of their wages is lost when the quantity and quality of their work are considered.

SKILLED OPERATIVES.

It was intended to make a complete canvass of the spinners and weavers employed in the cotton mills of the country, classified as men, women, and children. Owing to a defect in the form of the inquiry, which was not discovered in season to make a correction, there is reason to believe that some of the numbers were incorrectly returned, and the full table is not presented. Some facts which are trustworthy were, nevertheless, obtained. It was ascertained that during the census year there were between 5,000 and 6,000 persons employed as mule spinners, of whom about 2,250 were employed in Massachusetts mills, 750 in Rhode Island, 600 in New York, and 350 in Connecticut. About nine-tenths of the mule spinners were men. On the other hand, of about 43,000 frame spinners, only about one-sixth were men, and five-sixths were women and children.

The report of the number of weavers is entitled to more confidence than that of spinners, but it is not sufficiently accurate to be presented in detail. The number of weavers returned was 91,515, of whom 41,776 were men, 47,941 were women, and 1,798 were children. There are no earlier returns with which to compare these numbers. But it is well known to those conversant with the industry that only a few years ago the weaving of cotton goods was regarded as peculiarly the work of women. The introduction of improved and fast looms has led more and more to the employment of men as weavers. The tendency is so marked that the next enumeration should show the men in a majority.

WAGES.

It is a matter of general experience that wages in cotton mills were higher in 1900 than they were in 1890. It is almost impossible to obtain a true average by applying the rules of arithmetic to magnitudes of such diverse nature as those which represent the numbers of operatives employed and the gross amount paid to them in wages. Moreover the method of ascertaining the average number of persons employed, which was used at the census of 1900, was quite different from that adopted in 1890, and the figures for 1890 are exclusively those for skilled labor.

MISCELLANEOUS EXPENSES.

Table 11 is a comparative summary of miscellaneous expenses, showing the per cent that each item is of the totals for 1890 and 1900.

Table 11.—COMPARATIVE SUMMARY, COTTON GOODS, MISCELLANEOUS EXPENSES,[1] 1890 AND 1900, WITH PER CENT WHICH EACH ITEM FORMS OF TOTAL.

	1900		1890	
	Amount.	Per cent of total.	Amount.	Per cent of total.
Total	$20,057,190	100.0	$16,716,524	100.0
Rent of works	691,075	3.4	488,735	2.9
Taxes, not including internal revenue	3,521,606	17.6	2,689,632	16.1
Rent of offices, interest, insurance, and all sundry expenses not hitherto included.	15,844,509	79.0	13,538,157	81.0

[1] Exclusive of contract work.

Table 11 shows that the amount paid for rent of works was exceedingly small when the magnitude of the industry is considered. As against the total value of land and buildings owned in 1900, of $114,168,306, and in 1890, of $92,967,761, there was paid for rent of works by manufacturers who did not own all the plant used, in 1900 the sum of $691,075, and in 1890 the sum of $488,735. Estimating the average rent at 6 per cent, the value of the land and buildings rented would have been $11,517,917 in 1900, and $8,145,583 in 1890, or about one-tenth of the real estate owned at the time of each census.

MATERIALS USED.

COTTON.

The consumption of raw cotton of all kinds, domestic and foreign, in all the textile mills of the country during the census year was 3,872,165 bales, having an aggregate weight of 1,923,704,600 pounds. The use of cotton by the several textile industries was as follows:

	Bales.	Pounds.
In cotton mills proper	3,639,495	1,814,002,512
In hosiery and knit goods mills	99,518	49,451,301
In woolen mills	80,725	34,967,959
In worsted mills	12,079	5,276,751
In cotton small wares mills	7,213	3,640,878
In carpet mills	3,813	1,943,942
In cordage and twine mills	26,540	13,022,755
In felt and shoddy mills	2,782	1,398,502
Total	3,872,165	1,923,704,600

At the Twelfth Census no inquiry was made which reveals the variety of cotton used, save in respect to the cotton manufacturing industry proper, cotton small wares, and cordage and twine. It may nevertheless be assumed without risk of serious error that in establishments dealing with the wool fiber all the cotton used was the ordinary domestic staple. A certain amount of the cotton consumed in the few hosiery mills which reported spindles was Egyptian, and a small quantity of sea-island cotton was reported by one establishment, which is classified as "cordage and twine," as having been used in the manufacture of sewing thread. Disregarding these exceptions we may make the following classification of the cotton consumed:

	Bales.	Pounds.
Sea island	47,207	18,442,634
Other domestic	3,748,750	1,849,417,034
Egyptian and other foreign	76,208	55,844,932
Total	3,872,165	1,923,704,600

The figures in the two preceding tables are those which are to be compared with the commercial and official statistics, in which no discrimination is made between the several classes of factories in which the cotton is consumed. Taking first the greatest item, that of ordinary domestic cotton, the report of the New York Commercial and Financial Chronicle—which is generally accepted by manufacturers as the most thorough and accurate—accounts for the taking of 3,792,618 bales, by manufacturers North and South during the crop year 1899–1900. The corresponding census number is 3,748,750 bales. Inasmuch as the commercial returns are for a year beginning September 1, 1899, whereas those of the census are for the year beginning June 1, 1899, and in the case of not a few mills some months earlier, the divergence of the two reports is small and easily to be accepted; and the close approximation of the two, especially when it is remembered that there is a not inconsiderable amount of cotton which is used for purposes other than spinning, is a confirmation of the accuracy of both. Against the census return of 47,207 bales of sea-island cotton used in the mills herein reported, the Chronicle reports 49,543 bales of that variety of cotton left for consumption in the United States after deducting the amount exported from the total crop. This is a still closer correspondence between the two sets of figures. The difference between them is no greater than may easily be explained upon the grounds already mentioned. The imports of foreign cotton during the fiscal year ended June 30, 1900, amounted to 67,398,521 pounds, of which 1,381,463 pounds was reexported. The importation during the calendar year 1899, with which the consumption during the census year corresponded more nearly, was 62,014,809 pounds, and the net importation was 61,296,346 pounds, which exceeded by about 10 per cent the amount reported in the preceding table. It has already been explained that a certain amount—the exact quantity can not be stated—is masked in the returns of cotton-hosiery mills which were not asked to specify the kind of cotton used. Relative to these figures, it should be borne in mind that, whereas, the quantities reported in commercial returns are the gross purchases of material by manufacturers, the census figures are those of cotton which was actually manufactured and which entered into the merchandise reported under the head of products.

In 1900 the consumption of cotton in cotton mills proper was as follows:

	Bales.	Pounds.
Sea island	47,207	18,442,634
Other domestic	3,516,080	1,739,714,946
Egyptian and other foreign	76,208	55,844,932
Total	3,639,495	1,814,002,512

"OTHER DOMESTIC" COTTON.

The consumption of domestic cotton, other than sea island, in the cotton mills of the country during the census year was 3,516,080 bales, as compared with 2,231,385 bales reported at the census of 1890, an increase of 58 per cent. The average weight of bales was 494.8 pounds. By geographical divisions the consumption of cotton by bales and pounds, and the average weight of bales, was as follows:

GEOGRAPHICAL DIVISIONS.	Bales.	Pounds.	Average weight of bales.
New England states	1,719,622	874,011,257	508.3
Middle states	272,947	135,004,971	494.6
Southern states	1,477,775	707,159,521	478.5
Western states	45,736	23,539,197	514.7
Total	3,516,080	1,739,714,946	494.8

The variation shown in the weight of bales between the Northern and the Southern sections of the cotton-spinning industry is in strict accordance with experience. The bales made up from the crop of the Mississippi valley and of Texas are heavier than those of the Atlantic coast states. Spinners in the Carolinas and in Georgia, therefore, relying largely upon the local supply, make use of lighter bales than manufacturers in the Eastern states, who draw largely upon the Southwest for their raw material. The average weight of bales of the entire cotton crop of the United States during the crop year ending August 31, 1900, was, according to the commercial reports, 503.69 pounds; but the average weight of bales in the Carolinas and Georgia, from which states the bulk of the cotton consumed in the South was derived, was but 489.91 pounds; whereas, the bales of Louisiana and Texas averaged a weight of 514.8 pounds.

Table 12 presents the facts relating to the cotton crop of the United States for twenty-one years, 1880 to 1900, inclusive, as reported by the United States Treasury Department.

[1] Statistical abstract of the United States. U. S. Treasury Department, 1900.
[2] The "annual crop" represents the commercial movement for the years ending August 31, and was furnished by the New York Shipping and Commercial List, the New York Commercial and Financial Chronicle, and the New Orleans Cotton Exchange.

Inasmuch as a very large percentage of the cotton supply is of American origin, this statement of the crop by bales and pounds, and of its distribution, furnishes a measure of the annual increase of the cotton manufacturing industry in the United States, as compared with its increase in the rest of the world. It will be seen that the interval of twenty years made hardly any change in the percentage of the domestic products retained and of that which was exported, the difference being merely an increase of six-tenths of 1 per cent in the amount consumed at home. The ratio varies, of course, from year to year, but on the whole the table shows that the rate of increase of domestic production is equal to that of Great Britain and the continent of Europe.

Table 13 exhibits the quantity, cost, and cost per pound of "other domestic" cotton consumed, by states, in 1880, 1890, and 1900. Inasmuch as the purpose of this table is to show the average cost of cotton, and not to compare quantities consumed—which fact is sufficiently brought out in the preceding tables—the returns for 1900 exclude the consumption in "cotton small wares" establishments, and cover those of cotton mills only, whereas for the two preceding decadal periods "cotton small wares" are included.

TABLE 13.—COTTON GOODS, QUANTITY, AND COST OF DOMESTIC COTTON, OTHER THAN SEA ISLAND, CONSUMED, BY STATES GEOGRAPHICALLY ARRANGED: 1880 TO 1900.

[1] Includes Sea island, Egyptian, and other foreign.
[2] Includes establishments distributed as follows: 1900—Arkansas, 2; Louisiana, 2; West Virginia, 1. 1890—Arkansas, 2; Louisiana, 2; Texas, 1. 1880—Florida, 1; Arkansas, 2; Louisiana, 2; Texas, 2.
[3] Includes establishments distributed as follows: 1900—California, 1; Colorado, 1; Illinois, 1; Missouri, 2; Nebraska, 1. 1890—California, 1; Iowa, 2; Missouri, 1. 1880—Illinois, 2; Michigan, 1; Minnesota, 1; Utah, 1; Wisconsin, 1.

It will be seen from an examination of Table 13 that the average price of cotton in 1899–1900 was much below that in 1890, and that the decline was still greater when compared with 1880. Another fact which has a certain bearing upon the future of cotton manufacturing is that the average price in all parts of the country was fairly uniform. In 1880 the average price in states using a considerable amount of cotton varied between 9.52 cents per pound in North Carolina and 13.26 cents in New Jersey. In 1890 the variation was between 9.32 cents per pound in Alabama and 11.05 cents in Rhode Island. In 1900 the variation in states using as many as 75,000 bales each was from 6.19 cents in Alabama to 7.16 cents in North Carolina. Of course no general inferences of great value can be drawn from such facts further than that the price of cotton tends, under the influence of a local demand for the local crop and the steady cheapening of transportation charges, to equalize itself over the whole country. Differences in the quality of cotton used in the industry in the several sections of the country, and the season at which cotton is bought—often a mere matter of lucky or unlucky prognostication on the part of manufacturers—these things have too much influence in establishing average prices to allow definite conclusions to be drawn from the figures. It will be interesting to note how far consumption is overtaking production in some of the cotton states.

CROP, 1899-1900.	PRODUCTION (NEW YORK CHRONICLE).		CONSUMPTION (CENSUS).	
	Bales.	Pounds.	Bales.	Pounds.
Virginia	413,170	206,312,308	38,118	17,832,465
North Carolina	317,530	155,589,700	404,148	189,984,759
South Carolina	266,810	130,285,991	485,024	229,899,760
Georgia	1,358,586	665,978,857	303,836	145,470,324
Alabama	202,945	102,006,245	134,371	67,987,299

It appears that the crop of South Carolina needed to be supplemented by almost exactly 100,000,000 pounds, drawn from other states, to supply its spinners; that the North Carolina crop was deficient more than 34,000,000 pounds; that Alabama made use at home of two-thirds of its crop; that the great cotton-growing state of Georgia consumed more than one-fifth of its crop; and that even Virginia, which had made less progress in the industry than the states farther South, consumed more than one-twelfth of its crop. At the present rate of progress it will not be long before the entire cotton supply of the states on the Atlantic seaboard will be taken at home. More than half of it was taken during the census year here reported; for of the 1,260,000,000 pounds raised by the 5 states mentioned, their own mills took 651,000,000 pounds.

SEA-ISLAND COTTON.

The amount of sea-island cotton here reported as consumed in the United States is not only larger than the amount reported at any previous census, but it is also larger than the commercial report for any previous year. The nearest approach to the current figures are those for the crop year 1896–97 when the American consumption is fixed at 40,670 bales. The New York Chronicle reports are taken for the years intervening between 1890 and 1900.

AMERICAN CONSUMPTION OF SEA-ISLAND COTTON.

YEARS.	Bales.	YEARS.	Bales.
1890	21,283	1896	40,530
1891	26,651	1897	40,670
1892	32,093	1898	34,140
1893	22,911	1899	38,654
1894	24,345	1900	47,207
1895	34,981		

Notwithstanding an extending use of sea-island cotton, an increase in the crop has caused a decline in the price, which at this census is but 14.8 cents per pound, as compared with 25.1 cents in 1890. The use of this material is restricted to 5 states—Massachusetts, Rhode Island, Connecticut, New York, and New Jersey—although a small quantity is returned by one establishment in North Carolina.

EGYPTIAN COTTON.

The use of Egyptian cotton for the manufacture of fine fabrics, but more particularly as the material for knit underwear, has grown greatly during the last decade. The amount imported into the country nearly doubled during the ten years 1881–1890, rising from 4,440,996 pounds, valued at $757,352, to 8,407,160, valued at $1,393,071. But in the ensuing ten years the importations have still further multiplied eightfold. The following statement shows by fiscal years the imports of foreign cotton, which was nearly all Egyptian:

YEARS.	Pounds.	Value.
1890–91	20,908,817	$2,825,004
1891–92	28,663,769	3,217,521
1892–93	43,367,952	4,688,799
1893–94	27,705,949	3,003,888
1894–95	49,332,022	4,714,375
1895–96	55,350,520	6,578,212
1896–97	51,898,926	5,884,262
1897–98	52,660,363	5,019,503
1898–99	50,158,158	5,013,146
1899–1900	67,398,521	7,960,945
Total for 10 years	447,444,997	48,905,655
Annual average	44,744,500	4,890,565

During the census year 1889–90 there was reported a use of 6,560,951 pounds of Egyptian cotton. The present returns account for a consumption of 55,844,932 pounds, which should properly be increased by an unknown amount consumed in a few hosiery establishments which spin a part, at least, of their own yarn. Egyptian cotton possesses some peculiarities which adapt it especially to the uses to which it is put. It is especially desirable, on account of its natural silkiness, for the process of mercerization.

YARN PURCHASED.

Although there has been no perceptible movement during the last ten years in the direction of the English system of treating spinning and weaving as distinct industries—in the sense that both processes are not usually carried on in one factory—yet there has been a large proportionate increase in the number and importance of yarn mills. At the census of 1890 a little less than one-eighth of the value of products reported consisted of "yarns for sale;" at this census almost exactly one-sixth of the product is so classed. Although this increase, as will presently be noted, was demanded largely for consumption in collateral industries, there was an augmented use of cotton yarn in weaving establishments. The return of cotton yarn purchased for use in cotton mills proper, in the census year 1899–1900, was 83,832,216 pounds, valued at $15,749,536, as compared with 48,779,715 pounds, valued at $10,853,536, in 1890, an increase in value of about 50 per cent. Nevertheless, the situation has not changed substantially since it was noted in the report on the Eleventh Census that the establishments classed as "cotton goods," which make use of yarn not spun by themselves, are of three classes: (1) Those which both spin and weave, but do not produce enough yarn to supply their looms; (2) those which purchase fine yarn to be converted into sewing thread; and (3) those which weave only. It is noted elsewhere that the number of spindles in Pennsylvania has diminished during the last ten years. But there are in that state, chiefly in Philadelphia and its suburbs, a great many establishments which operate looms only in the production of the highest class of fancy-woven fabrics. They are by far the largest users of the yarn here reported among materials consumed. During the census year the factories in Pennsylvania took 36,304,919 pounds of this yarn, valued at $6,741,518, about 43.3 per cent of all the yarn so taken by the mills of the United States. Pennsylvania, with but 1.6 per cent of the spindles operated in the United States, has 3.5 per cent of the looms.

YARNS OTHER THAN COTTON.

The consumption of raw fibers, other than cotton, in the cotton mills of the country is quite unimportant; but in special mills there is a large use of yarn made of such fibers. The facts relating thereto were, at the census of 1900, obtained in much greater detail than heretofore. The following statement makes such comparisons as are possible with the statistics published in 1890:

MATERIALS.	1900		1890	
	Pounds.	Value.	Pounds.	Value.
Silk	298, 716	$1, 158, 321	32, 851	$154, 336
Spun silk	208, 403	625, 658	18, 683	83, 064
Linen	1, 575, 403	350, 962	17, 722	9, 823
Worsted	687, 019	415, 904	87, 257	62, 514
Woolens	435, 361	176, 467	196, 874	131, 657
Merino	87, 064	21, 946	....	....
Mohair	21, 398	21, 435	....	....
Camel's hair	134, 595	62, 838	....	....
Jute	220, 507	17, 967	99, 938	8, 976
Mercerized cotton	16, 233	15, 752	....	....
Tussur	15, 918	19, 102	....	....
Other yarn	103, 157	10, 221	224, 729	59, 312
Total	3, 803, 774	2, 896, 573	677, 954	509, 682

It appears from the foregoing tabular statement that the use of yarn made from fibers other than cotton has increased more than fivefold in the last ten years. Such yarns are, of course, employed for mixing with cotton. With the exception of jute, and the inconsiderable amount reported indefinitely as "other yarn," they are all of higher cost than ordinary cotton yarn; and their use implies not an adulteration, but an improvement of the fabrics into which they enter.

OTHER MATERIALS.

Raw cotton and yarn account for 80 per cent of the total value of the materials used. The rest is made up of oil and starch, mill supplies, fuel, and freight. The purity of the goods manufactured in American mills is attested by the fact that no place needs to be reserved in this branch of the statistics for any articles used elsewhere for "loading" fabrics. A careful return was required of the quantity of starch consumed—a necessity in dressing warps—and it appears that it constitutes only 3.7 per cent of the weight of piece goods and yarn produced.

PRODUCTS.

Table 14 exhibits the kinds, quantity, and value of products of cotton mills in 1900, together with such comparison with the corresponding figures for 1890 as the inquiries at the Eleventh Census render possible.

TABLE 14.—PRODUCTS OF COTTON MILLS IN DETAIL: 1890 and 1900.

KINDS.	1900		1890	
	Square yards.	Value.	Square yards.	Value.

All other products	....	9, 199, 758	....	20, 084, 120

[1] No separation of print cloths was made in 1890.
[2] Drills, twills, and sateens.
[3] Not separately reported.
[4] Cotton flannels.

The total value of the products of all the mills here reported was $332,806,156, of which $243,218,155, or 73.1 per cent, represented the value of woven goods; $55,188,663, or 16.6 per cent, the value of yarn spun to be used in other mills; $11,825,218, or 3.6 per cent, the value of sewing cotton; and $22,574,120, or 6.8 per cent, the value of miscellaneous and by-products. The proportion of these several classes of goods varies but slightly from that indicated in the census returns of 1890. There was a decline of about 1 per cent in the relative value of woven goods, an increase of about 4 per cent in the relative value of yarn for sale, and a decrease in miscellaneous products. It should, nevertheless, be remarked that the more thorough classification of products at this census is responsible for an apparent decline in miscellaneous products which is not real. A large part of the "all other products" reported in 1890 should undoubtedly fall into some of the newly specified classes of woven goods. In respect to the corresponding item in the returns of the present census, a still more detailed classification would have removed from "all other products" a large quantity and value of toweling and other woven products which are not properly classified as piece goods.

An inspection of the table brings out the fact which is known to all persons acquainted with the trade in cotton goods, namely, that the demand for coarse and medium goods is many times that for fine fabrics. The largest single item is that of sheetings and shirtings, 1,212,403,048 square yards, the whole of which is made from coarse or medium yarns; and the next in point of magnitude is the 1,056,278,952 square yards of print cloths, not finer than No. 28 warp. Most of the other classes of goods are wholly or mostly woven from medium or coarse yarns. The exceptions are the finer-print cloths, 525,334,875 yards (which is only one-ninth of the gross yardage of woven goods), a certain portion of the fancy woven fabrics, a part of the twills and sateens, and a small part of the ginghams. The fact that there is a great demand for coarse and medium goods and a limited market for fine goods is pertinent to the suggestion that manufacturers who are unable to compete successfully in the production of standard plain cloths can find their salvation in turning to the spinning of fine yarns and the weaving of fine fabrics.

In comparing the quantities and values of goods in 1890 and in 1900 it will be seen that, taking both classes of print cloths, there was an increase in quantity of more than one-half, and an increase in value of little more than one-third. There was an increase in the quantity of standard sheetings and shirtings of rather more than one-fourth, but the aggregate value was almost the same in 1890 and 1900. A small increase in the quantity of ginghams is accompanied by a reduction of more than one-fifth in the gross value. The same discrepancy is to be noted throughout the list. The explanation—the greatly diminished cost of cotton during the census year 1899–1900—is an interesting illustration of the untrustworthiness of statistics showing the value of products as a test of the condition of an industry, or for the purpose of comparing one industry with another.

An interesting feature of the details respecting woven goods is the great increase in the quantity of articles classed as upholstery goods. In 1890 they were reported as of a total value of $2,070,239; in 1900 they were returned at $8,670,384, consequently, the industry has become more than four times as important as it was ten years ago. Practically the whole of this industry is located in the city of Philadelphia.

An important increase is also to be noted in the production of yarns for sale. The amount, in fact, has almost exactly doubled, and the value is two-thirds greater than in 1890. There is a large and growing demand for yarn in knitting mills and in weaving establishments which do no spinning, as well as in mills which spin too little for their own consumption. Prior to 1890 there were few yarn mills in the South, but during the last decade there have been many factories of that class put in operation. A large part of the yarn here reported can be traced to its ultimate use. Thus, we find that 83,832,216 pounds were used in other mills, classed as "cotton goods;" 55,217,994 pounds in the wool manufactures; 131,820,068 in the hosiery and knit goods manufactures; 10,860,648 pounds in cotton small wares establishments; 6,444,208 pounds in silk manufactures; 3,860,235 in cordage and twine; 810,957 pounds in linen manufactures; and 301,888 pounds in jute manufactures. This leaves but 39,037,798 pounds not accounted for, but the consumption of yarn for other purposes is large—for example, in winding wire to insulate it for electrical conduction. The production of sewing cotton has not kept pace, in expansion, with most other branches of the industry. It may be that the consolidation of the producing companies has led to a more close approximation of demand and supply. It will be noted that, in common with other branches of the cotton manufacture, the average price of sewing cotton has declined.

MATERIALS AND PRODUCTS TWICE REPORTED.

The gross value at the factory of all the products of cotton mills is reported as $332,806,156. This sum is no doubt in excess of the net product, inasmuch as in many cases the finished product of one mill is the material of another. The excess is, nevertheless, far less proportionately than is the case with many other industries, for the reason that, as is elsewhere explained, the great majority of establishments in this branch of textile manufacturing carry through their raw material, cotton, from the baled lint to the woven cloth. In the aggregate, however, there is a large consumption of partially manufactured material consumed by weaving establishments, of which some spin a quantity of yarn insufficient to supply their looms, and others do not spin at all. Following is a statement, as complete as can be made, of the partially manufactured materials consumed which must be eliminated from the total of both materials and products to show the facts regarding this industry:

ARTICLES.	Value.
Yarn:	
Cotton	$15,749,536
Silk	1,158,321
Spun silk	625,658
Worsted	415,904
Woolen	176,467
Other	520,223
Total of yarn	18,646,109
Waste of other mills	1,513,281
Oil	494,179
Starch	1,223,102
Chemicals and dyestuffs	5,671,768
Mill supplies	7,664,490
Other materials	4,614,468
Total	39,827,397

Probably a considerable amount of the chemicals and dyestuffs reported consisted either of crude materials of domestic origin, which do not appear anywhere as a product of manufacture, or of articles imported in a condition for immediate use; but it is impossible to separate the amounts from the total, or even to make a reasonable estimate of their value. The whole is therefore counted as a duplication.

Deducting the total above shown from the total value of materials used, the remainder is $133,613,993. Deducting it also from the total value of products, the remainder is $292,978,759.

DYEING AND FINISHING.

The dyeing and finishing of cotton yarn and cloth is carried on partly in cotton mills and partly in independent establishments. The statistics of this industry are presented in the reports on combined textiles, and on the dyeing and finishing of textiles. Table 15 shows the additional work done upon the products of mills after spinning or weaving in both classes of establishments, and the additional value reported to have been given to those products by the several processes.

TABLE 15.—DYEING AND FINISHING IN COTTON MILLS AND IN INDEPENDENT ESTABLISHMENTS: 1900.

PROCESS.	TOTAL.		IN COTTON MILLS.		IN INDEPENDENT ESTABLISHMENTS.	
	Quantity, pounds.	Value added.	Quantity, pounds.	Value added.	Quantity, pounds.	Value added.
Yarn:						
Bleached	12,780,518	$252,635			12,780,518	$252,635
Dyed	205,713,712	7,691,268	151,610,157	$5,464,356	54,103,555	2,226,912
Mercerized	3,018,573	487,946	2,149,722	328,330	868,851	159,616
Total yarn treated	221,512,803	8,431,849	153,759,879	5,792,686	67,752,924	2,639,163
	Square yards.	Value added.	Square yards.	Value added.	Square yards.	Value added.
Cloth:						
Bleached	1,162,593,900	$7,623,875	197,691,533	$932,452	964,902,367	$6,691,423
Dyed	685,374,965	8,923,925	125,894,626	1,338,721	559,480,339	7,585,204
Printed	1,233,191,438	21,239,782	292,741,100	5,242,695	940,450,338	15,997,087
Mercerized	7,973,506	400,118			7,973,506	400,118
Total cloth treated	3,089,133,809	38,187,700	616,327,259	7,513,868	2,472,806,550	30,673,832
Total value added		46,619,549		13,306,554		33,312,995

From Table 15 it appears that $46,619,549 was added to the value of goods produced in the cotton mills of the country, by the various processes of dyeing and finishing. Manufacturers were not asked to return the amount of yarn bleached, and the full added value was therefore not ascertained. Even without this amount the returns show that of the yarn treated 69.4 per cent was treated in the cotton mills, and only 30.6 per cent in independent establishments. On the other hand four-fifths of the cloth treated was operated upon in independent establishments. Of the 4,509,750,616 square yards of woven goods reported in Table 14, 1,233,191,438 square yards were printed; 685,374,965 square yards were dyed; 278,392,708 square yards were ginghams, and 171,800,853 square yards ticks, denims, and stripes, containing dyed yarns—a total of 2,368,759,964 square yards. This indicates that something more than one-half of the woven goods produced in cotton mills is colored by printing or dyeing before entering into consumption. The figures relating to bleaching are to be considered with full allowance for the fact that bleaching is a necessary preliminary to printing and other processes, so that the same material is twice reported. Many manufacturers in making returns of dyeing or printing did not report separately the amounts bleached, but treated the whole process as one.

FINENESS OF GOODS—AVERAGE NUMBER OF YARN.

The method adopted for ascertaining the average number of yarn spun is the same as that first introduced at the Eleventh Census. The method in use prior to that time was based upon the number of spindles producing yarn of a particular fineness. For example, the average number of yarn produced by two mills, each having 10,000 spindles, the one spinning No. 20's and the other spinning No. 30's would be No. 25. This method was faulty, inasmuch as it assumed the equal speed and efficiency of all spindles, and also because it took no account of the fact that spindles of equal efficiency making coarse yarns spin a greater weight of yarn than those making fine yarn. The new mode of calculating it is based upon the quantity of yarn produced. The average of 5,000 pounds of No. 20 and 7,000 pounds of No. 36 would be No. 29.333. There would be 100,000 hanks (of 840 yards) of No. 20 and 352,000 hanks of No. 36, and the average is ascertained by dividing the number of hanks by the number of pounds. Of course, this method does not give an absolutely accurate result, inasmuch as manufacturers can not in all cases estimate exactly what is the average number of their own production, particularly if they make yarn of many degrees of fineness; but it is more nearly correct than the former system and is the most satisfactory method yet devised. To illustrate the inaccuracy that arises in the use of the present method, there is a mill in the state of New York which has a majority of its spindles producing yarn finer than No. 40; but as it operates also a comparatively small number of mules making coarse hosiery yarn, it reports its average number as 18.

It is, and probably it always will be, true that an overwhelmingly great proportion of the cotton goods demanded for use even in wealthy communities is made of medium or coarse yarns. It will be seen from the table showing the gross spinning of fine, medium, and coarse yarns, that not much more than one-twentieth of the yarn spun is classed as fine. Nevertheless there is a constant tendency toward finer spinning. The demand for cloth classed strictly as fine increases steadily, and, among the users of the heavy goods which represent the spinning and weaving industries in pioneer times, the desire grows for the standard sheetings and shirtings made of yarn ranging from No. 25 to No. 40. Yet the perversity of averages conceals these tendencies to a great extent, as will become evident upon an examination of the following statement, showing by states and geographical divisions the average number of yarn spun in 1900 and 1890:

No. 215——4

	AVERAGE NUMBER OF YARN.	
	1900	1890
United States	21.573	22.93
New England states	25.560	26.20
Maine	22.937	22.66
New Hampshire	19.174	21.14
Vermont	27.894	25.95
Massachusetts	25.097	26.75
Rhode Island	36.541	34.73
Connecticut	30.373	29.91
Middle states	19.176	20.45
New York	23.457	27.69
New Jersey	35.370	37.14
Pennsylvania	16.489	16.65
Delaware	23.522	22.33
Maryland	9.357	9.35
Southern states	17.046	14.76
Virginia	15.287	17.04
North Carolina	18.830	15.30
South Carolina	19.040	15.13
Georgia	14.371	14.35
Kentucky	13.722	15.75
Tennessee	12.722	12.22
Alabama	14.437	12.67
Mississippi	14.344	14.58
Arkansas	5.878	....
Louisiana	15.876	....
Texas	9.580	....
Western states	19.418	15.32
Indiana	18.262	14.66
Illinois	22.000	17.20
Wisconsin	20.879	20.37
Nebraska	27.000	....
Missouri	15.426	....
Colorado	20.000	....
California	9.000	....

From the foregoing figures it would be natural to conclude that the tendency has been toward coarser spinning. But it will be seen that the average number of yarn in the Southern states, where the largest increase has taken place, has advanced two and a quarter numbers. Yet because the average in that section is still eight and a half numbers below the average in New England, the general average of the whole country is reduced. In New England there was a large increase in the spinning of coarse, medium, and fine yarns. The proportional increase of fine spinning was 59.3 per cent more than the increase of coarse, and 94.7 per cent more than the increase of medium goods; but since the actual increase in pounds of fine yarn spun was less than the increase in the two other classes, the general average is slightly reduced. Table 16, showing the aggregate amount of yarn spun, by states, geographically arranged, divided into coarse, medium, and fine, in 1900 and 1890, gives a much better idea of the situation than can be obtained from any calculation of the average number.

POWER.

The returns of power used in the cotton-manufacturing industry present the extraordinary fact, that of the 806,121 horsepower employed in all the establishments in the United States, only 12,602 horsepower, less than 1.6 per cent, was hired. It should be explained that a large number of corporations whose factories are operated by waterpower do not own the water privileges. That is to say, they pay in one form or another for the water which turns their wheels. This expense is not classed as rent, but as a part of the materials used. It is evidently an expense of the same sort as the fuel which is consumed in supplying steam power.

Although the statistics are lacking for a comparison of the kinds of power in use during the year 1900 with those employed in previous census years, yet it may be surmised with a degree of confidence that the present returns signalize a culmination of the use of steam as compared with waterpower. In the early days of the industry cotton factories were usually, one might almost say invariably, located upon waterpower. So universally was this the practice that cotton mills which were erected in coast towns, where coal could be procured at a low transportation cost for steam making, were distinguished in the titles of the corporations as "steam" mills. But the inadequacy of waterpower as the motive force for great groups of factories, and the failures and stoppages caused by drought, flood and ice, led to the addition of steam engines for a supplementary power, and to the erection of mills without reference to waterpower. This change has gone to such an extent that steam power used in the factories is more than double the waterpower employed. The numbers representing the two kinds of power are 527,186 horsepower for steam, and 250,790 horsepower for water. There are, nevertheless, some reasons for believing that there may be a reaction, the importance of which can not be predicted. The development of the use of electricity carries with it the possibility of a cheap transmission of power to a distance without serious loss. In this way it becomes feasible to make available certain waterpowers which, on account of their location or the physical characteristics of the country, have heretofore been useless. The growing importance of electricity as a motor appears in the current returns which show a total of over 18,000 electric horsepower, owned and rented. The application of electricity direct to the machinery, without the use of shafting and belting, is comparatively new, but it is certain that it has a great future, and that hereafter manufacturers will find in the system great benefits, of which a saving in expense will not be the least.

MACHINERY.

Ever since the first application of mechanical power to the movement of the spindle there has been a constant improvement in the machinery employed in the spinning and weaving of cotton. The foundation of the cotton manufacture was laid in the almost simultaneous invention of the steam engine and the earliest form of spinning machinery. Hargreaves's spinning jenny, invented in 1764 and patented in 1770; Arkwright's water frame, the invention of drawing by rollers, brought out in 1769 and improved in 1775; Crompton's mule—so called because it combined the principles of Hargreaves's and Arkwright's inventions—patented in 1779; these antedated but a short time the introduction of Watts's steam engine, which was invented in 1769, became a practicable power agent by improvements made in 1781, and was first applied to the production of cotton yarn in 1785. All of Arkwright's patents, which included improvements in carding, drawing, roving, and spinning, were thrown open in 1785. In the same year Dr. Cartwright invented the power loom, and thus completed the group of fundamental inventions of which all modern spinning and weaving machinery is but an adaptation and a series of improvements.

But there has been another series of inventions directed to the economical, rapid, and thorough preparation of the cotton for spinning, as well as a constant succession of improvements in the final processes of the manufacture, which have multiplied a hundred if not a thousand fold the efficiency of the industry. In the year 1800 the scutching machine was introduced, the invention of Snodgrass, of Glasgow. The lap machine was introduced in nearly the form it has to-day by Mr. John Crighton, of Manchester, in 1814. Mr. Crighton also effected an important reform in the processes of opening and scutching. The invention of the carding machine and its gradual evolution into the almost perfect mechanism of to-day, cover nearly the whole of the Nineteenth century. The first important improvement was made in 1823. The principle of the revolving flat was devised in 1834. After being neglected for more than twenty years it was taken up and improved in 1857, and about 1880 became, in the hands of the Messrs. Ashworth, substantially the carding machine of the present day. The combing machine was first exhibited by its inventor, Mr. Josué Heilmann, of Mulhouse, at the Paris Exposition, in 1851.

The mule, as invented by Crompton, was a semi-manual machine. Richard Roberts, in 1835, transformed it into the purely automatic machine which we see at this time, so exact and precise in its several successive motions that it seems endowed with almost human intelligence. Since Roberts's time the history of the mule has been one of development in detail and of better construction, but the changes of this sort have made it vastly more useful in speed, in precision of action, and in the quality of the yarn which it makes. The improvement in frame spinning has been much greater than in the mule. The invention of the ring and the traveler in the third decade of the last century opened a wide field to the genius of mechanicians. Improvement followed improvement in rapid succession until the Rabbeth spindle reached what seems to be the practical limit of speed, and, therefore, of the production of yarn, at about 10,000 turns a minute. The final improvements, which made ring spinning more economical and profitable than mule spinning, for all except certain special purposes, in mills wherein both spinning and weaving are carried on, were accomplished in the closing decades of the century.

The most important advance in machinery during the past decade has been in the loom. Glancing backward we find that Cartwright invented the power loom in 1785, as has been already noted. The policy of the British Government at that time and for many years afterwards forbade the exportation of machinery and of patterns for making it. Accordingly, it was necessary to reinvent the power loom for use in the manufacture of cotton in this country. The feat was successfully accomplished by Francis Cabot Lowell, in 1814. Numerous improvements were made during the ensuing three-quarters of a century. The efforts of inventors are always directed toward the discovery of devices by which the speed of machinery may be increased, of automatic motions which will diminish the amount of care and attention to be bestowed by operatives upon the machines, and to a reduction of the time during which the machines must be stopped, either after a breakage of the yarn or to replace exhausted shuttles. Stop-motions have been devised for many of the machines used in cotton mills, arrangements by which the breaking of a single thread at any point causes the whole machine to stop instantly.

The problem of the loom, so far as necessary stoppages are concerned, has been most difficult. For spinning, the process, whether on the mule or on the frame, may be said to be almost continuous, the time required for doffing forming but an inappreciable part of the whole. But the capacity of the shuttle is limited. At the speed at which modern looms are run the yarn in the shuttle box is exhausted in about eight minutes, in the manufacture of medium shirtings or print cloths. If the yarn is coarser and the speed the same, the shuttle needs to be changed still oftener. Inasmuch as the cost of labor in weaving is fully one-half the labor cost of converting a pound of raw cotton into cloth, the importance of reducing or of doing away altogether with the time occupied in changing shuttles is too evident to be more than stated. Attention was long ago turned in this direction. In 1840 an English patent was taken out for a shuttle-changing device when the weft was broken or exhausted; but it seems not to have been successful, otherwise it would have been adopted by manufacturers throughout the world. Many inventors have exercised their ingenuity to overcome the mechanical difficulty. Within the last decade the principle so long sought after has been found, but it consists not in a changing of the shuttle while the loom is in motion, but in giving the shuttle a fresh supply of weft without removing it from the loom. The success of the Northrop loom has stimulated inventors to accomplish equally brilliant results by new devices of the shuttle-changing variety. Although there are some machines which effect the change with promising efficiency, they are yet in the experimental stage.

On the other hand, the Northrop loom, which was first brought to the attention of manufacturers in April, 1895, has such self-evident advantages for the weaving of plain cloth that in less than five years, at the end of the year 1899, the output was more than 42,500 looms. This loom has two fundamental improvements—the filling-changing mechanisms and the warp-stopping devices. By the first, the time of stoppage on account of exhausted shuttles is wholly saved. By the second, the machine is stopped instantly upon the breaking of a single warp thread. In combination they add greatly to the productive capacity of the weaver. A good weaver, operating plain narrow looms, has a capacity of 8 looms. His time is chiefly occupied by replacing empty shuttles and in mending broken warp threads. The first is the more important, inasmuch as the failure to repair warp breaks merely causes an imperfection in the weaving, which is tolerated in many classes of goods; whereas an empty shuttle means a stoppage of the loom. The filling-changing mechanism reduces to a small fraction the time needed to supply looms with weft, and thus leaves most of the weaver's time free to repair warp breaks. His capacity is therefore increased to the number of looms for which he can perform this service, practically, to double or more than double the number of plain looms which he can tend. The saving which is effected is illustrated by the fact that in some cases the weaver, on leaving his work for dinner, has left all his looms running, the filling magazines all full, and on returning at the expiration of the dinner interval has found some of them still running. All those in which there had been a breakage of the warp had of course stopped, and therefore no imperfect cloth had been woven.

The stimulation to the production of a rival to this invention has already been mentioned. But the introduction of the Northrop loom has had an important reflex influence upon other parts of the cotton-manufacturing machinery. For example, an appreciable gain of time can be made if the frequency of stoppages for changing the shuttle can be diminished. Heretofore mule filling has not been adapted to the Northrop loom, where a large ring bobbin can be more readily handled than a mule cop on the spindle. Moreover, there has been in the past difficulty in making mule cops of large size that would be proof against breaking in the shuttle, or in being handled about the mill. The waste from mule filling was in many cases so great as to be prohibitive. Weavers preferred to use small cops rather than take the risks of large cops falling apart in weaving. But the problem of spinning large, well-wound mule cops of filling yarn has now been solved, and the necessary devices can be applied to old mules. A weaver tending 8 looms, and changing shuttles that contain yarn enough to supply the loom eight minutes, has to make an average change of one a minute. The larger mule cops contain enough No. 36 yarn to run twelve minutes, and of course his loom capacity is considerably increased. Many manufacturers prefer mule filling for certain fabrics on account of the soft appearance and "feel" of the cloth, as compared with ring-filling cloth, and the new mills which have been built to make the higher grades of fine cloths are still fully equipped with mules to make filling.

If the mule is being adapted to produce yarns usable where frame-spun yarn has heretofore had full sway, there has been a promising effort to adapt the ring-traveler principle to the production of a slack-twisted yarn, which could formerly be made only on the mule, at the same time winding it on the bare spindle, in cop form. This improvement is as yet only in the experimental stage. At present there seems to be a difficulty in the way of making use of the device for the production of knitting yarns, which constitutes the largest demand for yarns not immediately used by the spinner. Soft-twisted yarns for knitting purposes should be in large cops to avoid frequent piecings in the knitting machine. This does not now seem practicable, for the greater diameter of ring necessary would bring too great a strain upon the yarn. No doubt in time this difficulty can be overcome, as many difficulties greater than this have been surmounted. The attempt to solve the problem is cited as evidence that the age of invention in the marvelously developed cotton-manufacturing industry has not yet closed.

THE PROGRESS OF THE INDUSTRY AS INDICATED BY THE NUMBER OF SPINDLES.

Table 17 shows the number of cotton spindles used in textile manufactures, by states, 1890 and 1900.

TABLE 17.—NUMBER OF ACTIVE COTTON SPINDLES IN THE TEXTILE INDUSTRY, BY STATES, GEOGRAPHICALLY ARRANGED: 1890 AND 1900.

The number of working spindles is the universally accepted measure of the capacity of cotton mills, and of the growth of the industry in any particular state or region. It is admittedly an imperfect measure; but it is not only more accurate than would be any expression in terms of capital employed, number of hands or their wages, quantity or value of materials consumed, or weight or value of product, but it is also a better gauge than is available for most industries. The present mill of 50,000 spindles is a vastly larger factory in all respects than was the mill of 50,000 spindles in 1850, and the 19,000,000 spindles of the year 1900 undoubtedly produce five times as great an amount of goods as the 7,000,000 spindles of 1870. Nevertheless, the necessity manufacturers are under to adopt improvements in machinery produces such an equalizing effect upon the several establishments at any one time that the percentage of correction needed is not great; and the rate of progress in the efficiency of machinery is so well known that it is easy to make allowance for it in comparisons of one time with another.

The grand total of active producing cotton spindles in all the textile mills of the United States during the census year 1899–1900 was 19,472,232, as compared with 14,384,180[1] at the Eleventh Census, a numerical increase of 5,088,052 spindles, or 35.4 per cent. These spindles were located as follows:

	1900	1890
In cotton mills	19,008,352	14,188,103
In hosiery and knit-goods mills	206,698	69,830
In worsted mills	95,356	68,225
In woolen mills[1]	59,460	58,022
In cotton small wares establishments	42,600	(2)
In cordage and twine factories	59,766	(3)
Total	19,472,232	14,384,180

[1] Including carpets. [2] Included in cotton mills. [3] Not reported.

The indicated increase in the number of spindles in mills other than cotton factories is apparent rather than real. A company in New England having 75,000 spindles, which in 1890 made both woven goods and knit goods, and was then classed as operating a cotton factory, now makes hosiery and knit goods exclusively,

[1] The total number of spindles in the United States as reported at the Eleventh Census was 14,550,323, of which 166,143 were idle spindles in cotton mills. At this census no idle spindles which are likely to be put in operation again were reported from any state.

and being classed with that industry swells the total unduly. In many cases, both in 1890 and in 1900, companies that produce both cotton and woolen or worsted goods, or mixed goods, made divided returns of their operations; some such companies made but one return, being classified according to the relative importance of their cotton or their woolen business. The fact of their making one return or divided returns at one census and not at the other explains partially the apparent increase in 1900. No doubt a certain part of the increase is real.

Although the gross number of operating spindles in mills of all kinds, 19,472,232, is to be taken as the true measure of the magnitude of the cotton industry in the United States, the present report deals exclusively with the spindles in cotton mills proper. The percentage of increase in them in the whole country is almost exactly 34 per cent. If we estimate that the average efficiency of spindles has increased 5 per cent during the same period, the ability of American mills to supply a demand for goods has increased about 40 per cent. Numerically there has been an addition of 2,014,832 spindles, or 18.6 per cent, in New England; of 13,529 spindles in number, or 0.8 per cent, in the Middle states; of 2,744,188 spindles in number, or 176.6 per cent, in the Southern states; and of 47,700 spindles in number, or 29 per cent, in the Western states. Taking account of the spinning capacity of spindles, the growth of the industry in the New England states is probably not greatly above that which is indicated by the actual number of spindles, since the mills in that part of the country were in advance of the South in installing improved spindles. On the other hand, not only has the number of spindles in the Southern states become nearly threefold that reported in 1890, but the spindles themselves are for the most part of the latest and most efficient types. With respect to one state the test of capacity by the number of spindles wholly fails. The industry in Pennsylvania is largely one of weaving yarn made elsewhere. Although the state ranks fifth in the value of the products of its cotton mills, and fourth among the states in the amount of wages paid to employees, it is only the twelfth according to the number of spindles. It shows a considerable increase of looms, and the industry has in fact expanded during the decade, but the number of spindles has declined.

Table 18 shows the mule and frame spindles in cotton mills, by states, geographically arranged: 1880, 1890, and 1900.

[1] Includes in 1880, 11,575 spindles reported by states other than those named.

[2] Includes in 1880, 22,100 spindles reported by states other than those named.

Attention was called in the report upon the Eleventh Census to the steady substitution of frame spindles for mules. The change has been going on to a marked degree during the past ten years. It would, perhaps, not be accurate to assert that mules have been to any great extent removed from old mills and ring spindles placed in them. The more correct view is that substantially all the new spinning is frame spinning. In New England the increase in mule spindles is less than 100,000; of frame spindles, nearly 2,000,000. In the South ten years ago there were only 108,474 mule spindles; there are now reported 180,534; but as contrasted with this very moderate increase we have an addition of almost 2,700,000 frame spindles. In the Middle states the mule has more than held its own. Ten years ago there was an excess of about 11,000 mule spindles over ring spindles. By the present count the excess is about 70,000. It is well known that although for most purposes in cotton manufacturing the yarn made upon ring spindles is altogether satisfactory, there is a demand for slack-twisted yarn chiefly for knit underwear, which has heretofore been produced by the mule only. Moreover, a mechanical difficulty which has not been overcome has been experienced in employing ring spindles for spinning upon cops, where the yarn made in one mill must be transported to another part of the country for consumption in hosiery mills. It is, therefore, not probable that there will be a reduction in the number of mules in use, and there may even be an increase; but the economy in the production of yarn by ring spindles, and the fact that the machinery can be operated by labor not so highly skilled as is required for mule spinning, will doubtless cause the tendency to install frame spindles in new spinning and weaving mills to continue. It will be observed that in Rhode Island there has been an actual decrease of ring spindles and an increase of mules. The mills of that state produce a large amount of fine yarn, and many of them are engaged extensively in spinning yarn for knitting mills. The ascendency of the mule in New Jersey is explained by the fact that the industry in that state is for the most part devoted to the production of fine sewing thread, to which the mule is by far the better adapted.

No radical improvement has been made during the past decade in spinning machinery of either kind, nor do the makers of such machinery anticipate great changes in the future. The mule is already a perfect machine, in the sense that it is automatic in every part and that in none of the various operations which it performs without human guidance does any part act as a drag upon others. Inasmuch as the spindles are now operated at as high a speed as is compatible with the spinning of good yarn, it follows that in order to increase the production sensibly it would be necessary to improve the machine not in one part only but in many parts. With respect to the ring spindle the quantity of yarn it can make of any particular count is directly proportioned to the speed of the spindle itself. Ten thousand turns a minute comes near to being the limit of the ring spindle under present conditions, because at a speed above that the travelers are apt to fly off badly. It it estimated that the average speed of the spindle on No. 28 warp yarn is about 9,000 turns. The production of yarn per spindle varies greatly with the number of yarn spun, and the speed varies in almost like proportion—that is, on coarse yarns a spindle running 7,000 turns a minute is running relatively as fast as when it is going 10,000 turns a minute on fine yarns.

During the ten years 1880–1890 the number of frame spindles sold by all manufacturers and placed in the old and new mills was 6,000,193. The corresponding number for the period 1890–1900 was 8,901,408. The total for the period of twenty years exceeds the whole number of ring spindles in the United States, a fact which suggests that substantially all the spindles of older types have been replaced. There were in 1880 in all the Northern states 10,111,387 spindles. No count was taken of the number of mule and frame spindles; but during the ensuing decade 1,569,589 new ring spindles were placed in old frames, and 3,561,896 spindles in new frames were installed, replacing either mules or old-fashioned ring spindles thrown out. At the close of the decade, at the census of 1890, there were in Northern mills 7,255,369 ring spindles. In the last ten years 3,520,640 spindles in new frames have been placed in mills which were built prior to 1890, in addition to 1,742,120 spindles in old frames. Thus more than one-half of the spindles in use ten years ago in Northern mills have since been replaced. The absolute increase of spindles in the South between 1880 and 1890 was 1,011,952. The number of new spindles installed in that part of the country during the same period was 868,708, which, it will be noticed, was 143,244 less than the total increase. During the early years of the Southern development it was not unusual to equip mills with machinery discarded by Northern mills. But in the last decade the numerical increase of frame spindles in the South has been 2,672,128, and the number of new spindles has been 3,283,884, showing that not only were all, or substantially all, the spindles in the new mills of the most modern type, but that about 600,000 old spindles in old mills were replaced by new. Combining the twenty years we find that there is a present total of 4,117,654 frame spindles in the South, and that 4,152,592 new spindles have been supplied to them in that time. The installation of new spindles, by years, and by a geographical division into North and South, is shown by the following table:

TABLE 19.—NUMBER OF FRAME SPINDLES SOLD, SUMMARY: JANUARY 1, 1890, TO JANUARY 1, 1900.

CONSUMPTION OF COTTON PER SPINDLE.

The length of yarn spun is, in general, directly proportioned to the speed of spindles. The weight of yarn spun upon spindles of equal efficiency is proportioned to the coarseness or fineness of the yarn. Thus it might happen that spindles of an ancient pattern, producing No. 10 yarn, would consume several times as much raw cotton as an equal number of the high-speed modern spindles would convert into No. 50 yarn. Consequently, in studying the table which shows the average consumption of cotton per spindle in the several divisions of the country, it must be borne in mind that the indication is a resultant of two forces acting in opposite directions.

It will be seen that the tendency is, as it was during the preceding decade, to an enlarged average consumption. In the whole country it has gone up from 70.43 pounds in 1880, to 78.79 pounds in 1890, and 95.43 pounds in 1900. The increase is due chiefly to the greatly enlarged extent of the industry in the South. For although the average increase per spindle in that section is but little more than 3 pounds, yet the number of spindles which consume more than twice the average of New England spindles is three times as great as in 1890, and the proportion of the whole is much larger. Although the circumstance of the excessive increase of spinning in the South as compared with the rest of the country masks the actual facts of the case, yet an analysis of the figures by sections gives some useful indications. Thus in New England there has been an increased relative production of fine yarn, and yet the average annual consumption of cotton has increased by 7 pounds, or rather more than 10 per cent. We may, perhaps, infer that the average efficiency of spindles increased somewhere between one-eighth and one-seventh. On the other hand, the average consumption per spindle in the Southern states increased but a little more than 3 pounds a year, or about 2 per cent. But there was a notable increase in the number of yarn spun in those states. For example, in North Carolina from No. 15.30 to No. 18.90, and in South Carolina from No. 15.13 to No. 19.04. It would require spindles averaging from 20 to 25 per cent greater efficiency to accomplish the conversion of an equal weight of cotton into the finer yarn; and since the actual consumption has also increased, we may fairly conclude that the average efficiency of spindles operated in Southern mills has increased by from 25 to 30 per cent, and that they are on the whole quite up to the average of the whole country. The industry, being stationary, or declining, in the Middle and Western states, except as regards the weaving business in Philadelphia, the facts regarding those divisions of the country call for no special comment. The situation presented is to be found in the following statement:

COTTON CONSUMED PER SPINDLE.

GEOGRAPHICAL DIVISIONS.	1900	1890	1880
	Pounds.	*Pounds.*	*Pounds.*
United States	95.43	78.79	70.43
New England states	72.94	65.95	62.72
Middle states	88.24	78.46	78.58
Southern states	164.65	161.41	155.94
Western states	111.07	147.55	171.55

Table 20, which is a continuation of one in the report on the Eleventh Census, is valuable rather in detail and for purposes of comparison than in any general deduction that may legitimately be drawn from it. This will appear from a consideration of the fact that although the number of spindles to each wage-earner has increased 5.64 in New England and 1.42 in the South—the two sections which combined contain 90 per cent of all the spindles in the country—the number of spindles to each wage-earner in the United States as a whole has decreased 1.02. The explanation is a simple one, namely, the marvelous increase of the industry in the South, where the number of persons employed by a mill of a given size is much greater than in the great factory towns of the North. As employees become more skilled and experienced, a greater average amount of machinery can be put in charge of each individual. This result is already beginning to appear in the labor returns of the southern mills; but a great proportionate increase in the number of spindles in the South, and of hands employed, showing, even at the improved condition, an average number of spindles to hands barely half that in New England, makes the comparison for the whole country, as between 1890 and 1900, misleading.

TABLE 20.—COTTON GOODS, NUMBER OF SPINDLES TO EACH WAGE-EARNER, AND THE AMOUNT PAID FOR LABOR TO EACH SPINDLE, BY STATES, GEOGRAPHICALLY ARRANGED: 1880 TO 1900.

[1] Included in "All other states."
[2] Includes establishments distributed as follows: Southern states—1900, Arkansas, 2; Louisiana, 2; West Virginia, 1; 1890, Arkansas, 2; Louisiana, 2; Texas, 1; 1880, Florida, 1; Arkansas, 2; Louisiana, 2; Texas, 2. Western states—1900, California, 1; Colorado, 1; Illinois, 1; Missouri, 2; Nebraska, 1; 1890, California, 1; Iowa, 2; Missouri, 1; 1880, Illinois, 2; Michigan, 1; Wisconsin, 1; Minnesota, 1; Utah, 1.

The figures examined in detail are nevertheless instructive and useful. It will be seen that the number of spindles to each wage-earner has increased in three of the four geographical divisions and in most of the states. The decline in the Middle states is to be ascribed chiefly to the fact mentioned elsewhere—that the industry in Pennsylvania is becoming more and more a weaving industry and that the number of spindles has declined. This feature becomes almost startlingly apparent in the last column of the table, where the labor cost per spindle is correctly reported as more than twice that of any other state. Indeed, the character of the industry in Pennsylvania differs so widely from that of any other state that it is not properly included in any table intended to show averages for the whole country.

With reference to the "labor cost per spindle" it is to be said that it shows upon the whole an increase, by states, by geographical divisions, and for the United States. It thus indicates a certain increase of wages, as the column showing the relation of the number of spindles to that of wage-earners indicates an increase of skill. But even here it is necessary to exercise caution in making deductions, for the problem is complicated by the fact that, premising an equal amount of skill on the part of operatives, a coarse-goods mill requires more machinery and more hands for a given amount of output than a fine-goods mill. The average spinning in the South is coarser than that in New England, and consequently a larger force is needed. Moreover, the matter of the labor cost per spindle is complicated by considerations of the hours of labor in a working day, of the proportion of women and children, as compared with men, employed, and of other matters of less importance than these. The table invites analysis by students of industrial problems, but it would be hazardous to base any conclusions whatever upon it without a careful weighing of special conditions in each state—in some cases the conditions in individual manufacturing cities.

LOOMS.

Inasmuch as the American cotton manufacturing industry is essentially a weaving as well as a spinning industry, it follows naturally that the number of looms employed keeps pace practically with the corresponding number of spindles. Against an increase of 34 per cent in spindles, during the decade, there has been an increase of 38.7 per cent in the number of looms. In both cases, "cotton goods" only in 1900 are compared with all cotton manufactures, including "cotton small wares" in 1890. The total number of looms in 1900 was 450,682, compared with 324,866 in 1890. There was a numerical increase of 48,769 in New England, of 1,060 in the Middle states, of 73,744 in the Southern states, and of 2,243 in the Western states.

An analysis of the looms as classified in the following table brings out no important facts which are not deducible from other statistics here presented, but it is confirmatory of the inferences to be drawn from them. For example, it appears from the statement of looms operated upon fancy weaves, that there was an increase of 22,453 in the number of such looms, and that 12,735 of the increase was in New England mills and 7,673 in mills of the Middle states; which is in accordance with the fact of a large increase in the fine spinning and weaving of the one section and of a wonderful growth of the weaving of upholstery and similar goods in Philadelphia. On the other hand, of the great numerical increase of 73,744 looms in the Southern states, 66,130 represent plain looms of all widths, compared with an increase of 33,621 plain looms in the New England states. It is an interesting fact that the increase in the number of looms in the whole country operated in the weaving of goods more than 36 inches wide exceeds the increase in the number of looms making goods of less width.

[1] Included with bags and other special fabrics in 1890.

Table 22 presents for 1900 the number and capacity of spinning mills, weaving mills, and mills which do both spinning and weaving, by states, geographically arranged.

Table 22 furnishes a basis for future comparisons, as well as showing the situation with respect to the operations carried on in the cotton mills of the United States. It will be seen from this table that, of the total number of establishments, more than half both spin and weave. In the matter of capacity the proportion is vastly greater, as 83.6 per cent of the spindles, and 96 per cent of the looms, are installed in what may be termed complete mills. Even these large proportions would be increased were the mills of the Middle states eliminated. More than one-third of all the spindles and looms in those states are in mills which spin only, and more than one-third of the looms in mills which weave only. This circumstance is due to the fact that half the product of New Jersey mills is sewing cotton, and that weaving is the principal feature of the industry in Pennsylvania. Excluding the Middle states, the percentage of spindles in spinning and weaving mills is 85 per cent and that of looms is almost 99 per cent. The figures for the Southern states indicate a tendency to erect yarn mills. In North Carolina more than two-fifths of the spindles are the equipment of such mills, and the proportion is large in some of the other Southern states also.

MERCERIZATION.

During the past ten years the process known as mercerizing has been introduced, or, more strictly, reintroduced, as an adjunct of the cotton manufacturing industry. The process derives its name from its discoverer, John Mercer, an Englishman, who was born in 1791 and died in 1864. Mercer was a man of humble origin, by trade a handloom weaver, and self-taught. Entering a print works as an ordinary workman, he became interested in chemical processes, was made experimental chemist to the works, and in a short time introduced several new styles in calico printing. He was the first to prepare sulphated oil, which revolutionized the turkey-red industry; was the inventor of the blue-print photographic process, and even devised and improved several pharmaceutical preparations. In 1852 he was elected a Fellow of the Royal Society. About the year 1845 or 1846 appeared the first notice of the mercerizing process, and it was patented in 1850. It excited great attention at the first world's fair, in London, in 1851, and great commercial success was anticipated for it; but for various reasons it did not become successful in Mercer's lifetime, nor, in its original form, at any time.

The process of mercerizing, proper, consists in treating vegetable fiber, chiefly cotton, in the condition of yarn or of woven goods, to the action of caustic soda dissolved in water, and treating it subsequently with pure water and with dilute sulphuric acid for the purpose of washing out or extracting chemically the soda that remains in the yarn or fabric. The process effectuates both a chemical and a physical change in the constitution of the fiber. The wing of the cottonseed is pure cellulose, the chemical symbol of which is $C_{12}H_{20}O_{10}$—12 atoms of carbon, 20 of hydrogen, and 10 of oxygen. The caustic soda and the water in which it is held in solution unite with the cellulose; but the soda is afterward removed by washing with water and by "souring" with acid, and that which remains is hydrated cellulose—that is, cellulose combined with water. It is probably not strictly accurate to say that the cellulose and water are chemically combined, since the water contained may be removed by drying without restoring the cellulose to its original condition; but, on the other hand, after the desiccation the mercerized yarn or cloth will reabsorb water from the atmosphere naturally.

The structural change in the fiber is a marked one. The filament of cotton is a flattened tube or band, the sides of which are pressed closely together, leaving a central cavity which is enlarged at each edge of the flattened tube. It is opaque, and the surface is not smooth. The fiber has also a slight natural twist. All these characteristics are modified by the mercerizing process. The tube becomes rounded into cylindrical shape; the cavity is made smaller and the walls of the tube thicker; the surface is made smoother and the opacity is diminished; and the fiber acquires a spiral form. These are not the only physical changes introduced by the process, for there is a perceptible shrinkage in the length of either yarn or cloth treated by Mercer's formula. As will presently be noticed, the modern method overcomes the shrinkage, but as originally introduced the loss in linear dimension varied from 15 to 25 per cent. Moreover, the weight, and consequently the specific gravity, of the yarn or fabric is increased, as is also the strength of the material, this last gain varying from 35 to nearly 70 per cent, according to the conditions under which the mercerizing is done. Another important result of the process is that mercerized cotton has a much greater affinity for certain dyes and mordants than cotton which has not been so treated.

The changes heretofore mentioned were those which Mercer specified in his application for a patent. The chief advantages which he claimed were the greater strength of yarn or cloth and the greater affinity for dyes. These are not the advantages which have caused the reintroduction of the process. Reference has been made to the fact that mercerizing causes a contraction of the fiber and a loss of length. Advantage was taken of the shrinkage to produce crepon effects in cloth, particularly in union cloth, but it was not availed of to any large extent. It has been discovered, however, that if the mercerizing be done under tension—that is, if it be simply held from shrinking, but not stretched, while the material undergoing treatment is immersed in the caustic bath and while the alkali is being removed by water and acid—the fiber becomes more translucent, the surface smoother, and the yarn or woven goods treated acquire a luster similar, and not greatly inferior, to that of silk. The same result can be produced by stretching the material operated upon to its original length immediately after it has been subjected to the caustic bath, and before it has lost its pliable condition. The acquisition of a glossy appearance by mercerized goods was noticed in the early days of the process, but it is only recently that the increased luster imparted by holding the material from shrinking caused a revival of the manufacture.

The improved process in mercerization while the goods are in a state of tension is the subject of protracted patent litigation which has not yet been brought to a decision. The process itself is a simple one, but must be conducted with great care. As applied to yarn it consists in passing it through the bath between rollers which prevent all contraction, and then through the water bath and a weak solution of sulphuric acid under the same conditions. The rollers serve also the purpose of squeezing out the caustic, the water, and the acid, and so facilitating and rendering complete the removal of all chemicals which might cause a contraction after the tension is relaxed.

The uses to which mercerized material may be put are various. The process has not been applied with success to ordinary upland cotton, but only to Egyptian and sea-island cotton, which are naturally somewhat silky. These are the varieties of cotton which are employed in the production of underwear and the finest of woven goods, which are made much more beautiful by the luster imparted as well as by the brilliancy of the dyeing. It is believed, however, that the fact that mercerized yarn loses something of elasticity in gaining strength, is against its general availability in the manufacture of hosiery and knit goods.

The amount of yarn mercerized in cotton mills during the census year was 809,468 pounds. In dyeing and finishing establishments 868,851 pounds of yarn and 7,973,506 square yards of cloth were mercerized. The total additional value given to yarn and cloth by mercerizing, in all establishments, was $679,490.

Table 23 presents a comparative summary of the entire industry, cotton goods and cotton small wares, by states and territories, geographically arranged for the several censuses from 1840 to 1900, inclusive; and Table 24 presents the detailed statistics of cotton goods for 1900.

[6] The error referred to in note 7 is also contained in this total.
[7] Owing to error in the published statistics for 1880 the cost of cotton in Indiana is shown to be in excess of the total cost of all materials used.
[8] Included in "All other Western states."
[2] Includes establishments distributed as follows: 1900, California, 1; Colorado, 1; Illinois, 1; Missouri, 2; Nebraska, 1. 1890, California, 1; Iowa, 2; Missouri, 1. 1880, Michigan, 1; Minnesota, 1. - 1870, Iowa, 1.

[1] Includes establishments distributed as follows: Southern states—Arkansas, 2; Louisiana, 2; West Virginia, 1. Western states—California, 1; Colorado, 1; Illinois, 1; Missouri, 2; Nebraska, 1.

COTTON SMALL WARES.

At the census of 1900 for the first time a separate classification was made of the establishments producing cotton small wares, including cotton lace, edgings, boot and shoe lacings, corset lacings, lamp and stove wicks, tapes, webbings, and trimmings.

A small number of these establishments may have been reported at the Eleventh Census under the head of "millinery and lace goods," and some others may have been included in the class of "boot and shoe findings." Most of them, however, were included with cotton goods. Inasmuch as a few only of these establishments make use of raw cotton, or operate spindles, and since their products are quite distinct in character from those of ordinary cotton mills, it seems desirable to group them by themselves, in order to avoid misleading deductions from the statistics of the cotton manufacture proper, to recognize the importance of a rapidly expanding industry, and to lay a basis for future comparisons.

Nevertheless, the following tables do not give an exact view of the magnitude of the industries included in this group. The rule necessarily followed in classifying establishments is to combine those whose chief product, measured by value, is similar. Evidently no rule of classification gives an entirely satisfactory result. In the present instance there are cotton mills that make nothing but sewing cotton, and establishments which must be classed as producing cotton small wares that make a certain quantity of sewing cotton. Although tape and webbings are frequently a minor and incidental product of cotton mills, a small establishment which buys its yarn and makes tape and webbings exclusively may not properly be classed as such a mill.

These considerations will explain why the use of a considerable amount of raw cotton and the operation of a certain number of cotton spindles are reported in a class of mills which, as a rule, do not spin their own yarn. They will also indicate that neither do the following tables disclose the entire product of the articles included under the designation of cotton small wares, nor do all the products of the mills here reported fall properly under that designation. But a fairly accurate statement can be deduced from a comparison with the reports of other textile industries.

Table 25 presents the leading statistics of cotton small wares for 1900.

TABLE 25.—COTTON SMALL WARES: SUMMARY, 1900.

Number of establishments	82
Capital	$6,397,385
Salaried officials, clerks, etc., number	189
Salaries	$226,625
Wage-earners, average number	4,932
Total wages	$1,563,442
Men, 16 years and over	1,367
Wages	$671,516
Women, 16 years and over	3,173
Wages	$828,732
Children, under 16 years	392
Wages	$63,194
Miscellaneous expenses	$462,534
Cost of materials used	$3,110,137
Value of products	$6,394,164
Active spindles, number	42,600
Looms, number	5,070
Cotton consumed, bales	7,213
Cotton consumed, pounds	3,640,878

The geographical distribution of the establishments reporting is as follows: New England states, 32; Middle states, 47; Georgia, 1; Ohio, 1; Indiana, 1. The several industries are of a class which tends to spring up within cities or in their suburbs, and a large proportion of those here reported are in, or in the immediate vicinity of, New York, Philadelphia, Boston, and Providence. They are for the most part small establishments. The average capital indicated is something less than $80,000. There are, however, some large establishments in Rhode Island. The combined capital of three of them is nearly $2,000,000, which is almost one-third of the amount reported for the whole country. The elimination of the returns of these three mills would bring the average capital down to about $56,000. The average number of hands employed in each establishment was 60; outside of Rhode Island, it was but 41. An inspection of the average number employed during each month indicates great steadiness of employment, the slight falling off during the summer months being no greater than is easily explained by the practice of allowing employees to take a vacation.

The chief materials used are shown by the following statement:

Materials.	Pounds.	Cost.
Raw cotton	3,640,878	$264,541
Cotton yarn	10,860,648	1,873,032
Woolen yarn	274,351	91,251
Worsted yarn	47,308	33,414
Silk yarn	43,709	134,296
Spun-silk yarn	9,852	25,394
Other yarn	718,444	139,666
Raw cotton and yarns	15,595,190	2,561,594
All other materials		548,543
Total cost		5,671,731

Ninety-three per cent in weight and 83 per cent in value of the raw or spun fiber used was cotton, but in the aggregate not a little of the product was mixed as to material.

A classification of products can not be made. Manufacturers were not asked to report with exactness the specific character of their goods, and indeed, the variety and the absence of standard units of quantity would have rendered such specification valueless. Nevertheless, from the total value of products reported, $6,394,164, the following items should be subtracted as not coming properly under the classification of cotton small wares: Upholstery goods, $35,000; yarns for sale, $27,403; sewing cotton, $83,453; and twine, $71,465—a total of $217,321. On the other hand, in order to obtain the actual total of cotton small wares produced in all the mills of the country, and not merely of these here reported, it is necessary to add to the remainder the sum of $328,801, value of tape and webbings made in cotton mills, and a large but unknown sum out of the item of more than $5,000,000 reported in the returns of cotton manufacturing proper, under the head of "All other products of cotton."

Table 26 presents the detailed statistics for the industry for 1900.

TABLE 26.—COTTON SMALL WARES, BY STATES: 1900.

	United States.	Massachusetts.	New Jersey.	New York.	Pennsylvania.	Rhode Island.	All other states.[1]

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 216. WASHINGTON, D. C. June 28, 1902.

MANUFACTURES.

PRINTING AND PUBLISHING.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I transmit herewith, for publication in bulletin form, a report on printing and publishing, prepared under my direction by Mr. William S. Rossiter, of New York, acting in the capacity of an expert special agent of the division of manufactures of the Census Office.

This report is divided into two parts: Part I, tables and analysis; Part II, progress in the printing and publishing industry.

The statistics of the industry are presented in Part I in 19 main tables. Table 1 gives a general summary of the industry by classes for 1900, and Table 4 a comparative summary for 1890 and 1900. In Table 5 are presented comparative statistics relating to the main division of the industry, newspapers and periodicals, covering the period 1880 to 1900. All tables which follow, with the exception of Table 18, relate to this division of the subject. Table 11 classifies newspapers and periodicals according to period of issue and character of publication, 1880 to 1900, while Tables 15 and 19 deal with number and circulation, 1850 to 1900, and with average circulation per issue, 1880 to 1900, respectively, of newspapers and periodicals classified by period of issue. Table 21 gives the number of newspapers and periodicals in 1880, 1890, and 1900, classified according to the language in which printed. Tables 25 and 27 give cost of paper used and value of products, respectively, in 1900. In Table 28 the states and territories are ranked according to the aggregate circulation per issue of newspapers and periodicals in 1900. Table 29 gives statistics relating to daily publications in 50 cities for 1900, and Table 30 gives similar statistics for 27 cities for 1880, 1890, and 1900. Table 33 presents, by states and territories, the circulation and the number of inhabitants to each copy per issue of all newspapers and periodicals published in 1900. Table 34 is a comparative summary, by states and territories, of the newspaper and periodical industry for the years 1880, 1890, and 1900. Table 35 is a comparative statement, by states and territories, of the average and aggregate circulation per issue of newspapers and periodicals published in 1880, 1890, and 1900. Table 42 gives, by states and territories, the number of publications in 1880, 1890, and 1900, classified according to period of issue and character of publication. Table 49 gives, by states and territories, for newspapers and periodicals reporting in 1900, the aggregate circulation per issue and the aggregate number of copies issued, classified according to period of issue. Table 54 is a summary, for cities of over 20,000 inhabitants, of book and job printing in 1900. Table 58 is a detailed summary, by states and territories of the newspaper and periodical industry in 1900.

In addition to these main tables, a number of derivative tables have been prepared, in order to bring out comparisons of special interest in connection with the topics discussed in the text.

In Part II is presented a detailed description of the principal mechanical improvements and of the changes in news gathering which have marked this industry since 1890, and in some cases since 1880.

In drafting the schedules of inquiry for the census of 1900 care was taken to preserve the basis of comparison with prior censuses. Comparison may be made safely with respect to all the general heads of the inquiry, except those relating to capital, salaried officials, clerks, etc., and their salaries, the average number of employees, and the total amount of wages paid. Live capital, that is, cash on hand, bills receivable, unsettled ledger accounts, raw materials, stock in process of manufacture, finished products on hand, and other sundries, was first called for at the census of 1890. No definite attempt was made, prior to the census of 1890, to secure a return of live capital invested.

Changes were made in the inquiries relating to employees and wages in order to eliminate defects found to exist on the form of inquiry adopted in 1890. At the census of 1890 the average number of persons employed during the entire year was called for, and also the average number employed at stated weekly rates of pay, and the average number was computed for the actual time the establishments were reported as being in operation. At the census of 1900 the greatest and least numbers of employees were reported, and also the average number employed during each month of the year. The average number of wage-earners (men, women, and children) employed during the entire year was ascertained by using 12, the number of calendar months, as a divisor into the total of the average numbers reported for each month. This difference in the method of ascertaining the average number of wage-earners during the entire year may have resulted in a variation in the number, and should be considered in making comparisons.

At the census of 1890 the number and salaries of proprietors and firm members actively engaged in the business or in supervision were reported, combined with clerks and other officials. In cases where proprietors and firm members were reported without salaries, the amount that would ordinarily be paid for similar services was estimated. At the census of 1900 only the number of proprietors and firm members actively engaged in the industry or in supervision was ascertained, and no salaries were reported for this class. It is therefore impossible to compare the number and salaries of salaried officials of any character for the two censuses.

Furthermore, the schedules for 1890 included in the wage-earning class, overseers, foremen, and superintendents (not general superintendents or managers), while the census of 1900 separates from the wage-earning class such salaried employees as general superintendents, clerks, and salesmen. It is possible and probable that this change in the form of the question has resulted in eliminating from the wage-earners, as reported by the present census, many high-salaried employees included in that group for the census of 1890. With the exception of these and several other changes in the special features of the schedules, which do not affect the value of the statistics for comparative purposes, the investigation has been conducted along the lines followed at the census of 1890.

In some instances the number of proprietors and firm members, shown in the accompanying tables, falls short of the number of establishments reported. This is accounted for by the fact that no proprietors or firm members are reported for corporations.

The reports show a capital of $292,517,072 invested in the 22,312 establishments reporting for the industry. This sum represents the value of land, buildings, machinery, tools, and implements, and the live capital utilized, but does not include the capital stock of any of the corporations. The value of the products is returned at $347,055,050, to produce which involved an outlay of $36,090,719 for salaries of officials, clerks, etc.; $84,249,889 for wages; $55,897,529 for miscellaneous expenses, including rent, taxes, etc.; and $86,856,290 for materials used, mill supplies, freight, and fuel. It is not to be assumed, however, that the difference between the aggregate of these sums and the value of the products is, in any sense, indicative of the profits in the manufacture of the products during the census year. The census schedule takes no cognizance of the cost of selling, or of interest on capital invested, or of depreciation in plant. This statement is necessary in order to avoid erroneous conclusions from the figures presented.

Very respectfully,

S. N. D. North

Chief Statistician for Manufactures.

PRINTING AND PUBLISHING.

By William S. Rossiter, *Expert Special Agent.*

The separation of the statistics of printing and publishing into "newspapers and periodicals" and "book and job printing" is necessarily so difficult that a complete division has not been attempted in the tables and discussion which appear in this report.

In this industry the practice of the large cities differs sharply from that of the smaller communities. In the former, book and miscellaneous printing and the printing and publishing of newspapers and periodicals are separated into two distinct industries. While it is true that type and printing presses are employed in both, the plant of a large city newspaper is adapted solely to its own routine requirements, would be practically useless in a job office, and seldom contains enough job material even to produce its own stationery. In the large communities newspaper proprietors have secured their experience in their own profession, and frequently are unfamiliar with job printing. The city job printer, on the other hand, considers his calling a distinct one, knows little of the mechanical requirements of the daily paper, and does not regard newspapers as competitors in the remotest sense. These are the extremes. Between them are the small publications and the numerous trade periodicals, which seldom own their own plants. Publications of this description patronize job printers to avoid the installation of individual plants, but in any division of the products of the industry they should, of course, be classed with newspapers.

In villages, towns, and cities of less than 20,000 inhabitants, with few exceptions, the newspaper office is the job office, and the accounts of the two ventures are so interwoven that satisfactory separation is impossible. The newspaper is merely one item of the total product, but generally gives the establishment its name, directs its policy, and often determines the success or failure of the office.

At the Tenth Census newspapers and periodicals were treated in an able and exhaustive report by Mr. S. N. D. North. The job office, however, received no attention, except in the most general way, at either the Tenth or the Eleventh Census. In 1900 the job offices in the large cities were so numerous, represented so great an investment, used such a diversity of materials, and turned out products of so great value, that more than passing reference to this branch of the industry is clearly due.

This report is divided into two parts: Part I, tables and analysis; Part II, progress in the printing and publishing industry. In Part I are presented 55 tables, preceded by a summary. Of these tables, 4 relate to the general subject of printing and publishing, 50 to newspapers and periodicals, and 1 to book and job printing. Of these tables the more important are so constructed as to be comparable with the tables presenting the statistics of this industry at the Eleventh Census. The remaining tables are merely comparisons derived from the 19 main tables, and with a few exceptions contain no original figures.

In Part II is presented a detailed description, also preceded by a summary, of the principal mechanical improvements, and of the changes in news gathering, which have marked this industry since 1890, and in some cases since 1880.

I. TABLES AND ANALYSIS.

The more important conclusions, which seem justified from careful consideration of the tables appearing in this report, may be thus summed up:

When the two branches of the industry are separated—as far as separation of products so closely related is possible—the total value of all book and job printing products is about equal to the total value of all distinctive newspaper products; the former, including the printing and publishing of music, being $168,930,707, or 48.7 per cent of the total, and the latter $175,789,610, or 50.7 per cent of the total.

The capital invested in both branches of this industry showed a marked increase, while the value of products per establishment declined. The number of establishments in the newspaper and periodical branch, proportionately 83 to every 100 publications in 1890, remained nearly stationary in 1900, being 84 to every 100 publications.

Of all newspaper and periodical establishments 63.3 per cent were owned by individuals, 19.7 per cent in partnership, and only 17.0 per cent by corporations, indicating that combinations of any consequence are unlikely in this industry.

The total number of wage-earners increased only 10 per cent, but the value of products earned by them increased 24 per cent. There was a much greater relative increase among women than men, suggesting that competition may have led to a search for a less expensive form of labor.

Of the total value of products, advertising formed 43 per cent, subscriptions and sales 35.8 per cent, and book and job printing, including miscellaneous products, 21.2 per cent. The proportion of subscriptions and sales steadily declined from 1880, while the proportion which advertising formed steadily increased until it was over half. This suggests that publications depend more and more upon advertising as their principal source of income.

In 1890 the increase in the number of all publications was greater than the increase in population, but in 1900 the increase in number of publications and in population was about the same. It appears, however, that the per cent of increase in the number of daily newspapers and the per cent of increase in urban population remained about the same for two decades, suggesting a certain degree of relationship between these figures.

During the decade there was an increase in the proportion of daily, triweekly, semiweekly, and monthly publications, indicating that the first three mentioned have attracted support from the weekly, and that the monthly has drawn away support from the quarterly.

There was a marked decline in the proportion of publications devoted to special topics, and an advance only in the classes devoted to news topics and to general reading. The total circulation per issue of dailies was enough to supply one for every five inhabitants. The total circulation per issue of weeklies and monthlies was one to two inhabitants.

Publications printed in English formed 94.3 per cent of all publications reporting for 1900, showing a considerable increase over the corresponding figures for the preceding decade. The figures for publications printed in foreign languages indicate a rather close connection with the movement of immigration. The publications printed in foreign languages appear to depend to a large extent upon recent arrivals speaking the language in which the publication is printed. The increase or decrease is, in general, in proportion with the increase or decrease in immigration. The decrease in the proportion of all publications printed in foreign languages may be compared with the facts brought out in Volume II, Twelfth Census, page cxxv, that in 1900 12.2 per cent, and in 1890 15.6 per cent of the foreign born white population at least 10 years of age were unable to speak English, suggests that the immigrants reaching the United States during the past decade have been more ignorant and less interested in the perusal of publications than those who preceded.

One and one-quarter billion pounds of paper were used during the census year. Of this amount 77.6 per cent was consumed for newspapers, 16.4 per cent for books and periodicals, and 6 per cent for job printing, but the proportionate cost was 58.7 per cent, 24.7 per cent, and 16.6 per cent, respectively.

Daily evening newspapers increased more rapidly than daily morning papers. In 1890 there were two evening papers to every morning paper; in 1900 the proportion was about one to three.

The circulation per issue of daily papers in certain large cities, compared with the population, indicates that the inhabitants of certain cities were tributary, in the matter of publication, to certain others. In the circulation of weeklies and monthlies, special publications issued in certain states had a marked effect upon the standing of the product of those states in this industry, as, for example, in Maine and Tennessee.

On analyzing the total circulation reported for each state, it is found that 10 leading states supplied four-fifths of the circulation per issue of all publications. This fact is shown to be true, to a greater or less degree, of all of the principal classes of publications, indicating the concentration of circulation in certain populous states.

However, the influence exerted by 10 states in circulation, is not maintained in number of establishments, capital, or value of products. During the last two decades the number of establishments increased more rapidly in states having a small number of establishments than in those having many. This also suggests, to some extent, concentration of establishments in the more populous states.

All but 16 states and territories showed an increase in the number of publications to each 1,000 inhabitants, but the per cent of increase in aggregate circulation per issue declined in 39 states.

The proportion of inhabitants to each weekly was far more uniform than the proportion to each daily, ranging in the former case from 2,016 for Nevada to 20,407 for Rhode Island; in the latter from 4,703 for Nevada to 191,474 for South Carolina.

Weekly publications were most numerous in proportion to inhabitants in the West and Northwest. New England ranked high in dailies but low in weeklies, suggesting that in that densely settled region the daily had to some extent supplanted the weekly. During the decade the number of inhabitants to each weekly publication increased in 26 out of 49 states, but in less than half of the states and territories did the increase in the number of weeklies keep pace with the increase in population.

The proportion of inhabitants to dailies decreased in 31 states and territories, showing a marked gain in the number of dailies in proportion to the population. All states bordering upon the Great Lakes, and 15 out of 21 seaboard states, showed an increase in the proportionate number of daily newspapers to the number of inhabitants. The states in which the daily lost ground were, in general, those in the far Northwest, where the weekly made its principal gain.

Of all the minor geographic divisions, the Southern North Atlantic—New York, New Jersey, and Pennsylvania—show the most striking advance in the proportion of the total circulation reported. In circulation of daily newspapers all states and territories showed a decided increase. In circulation of weekly publications the Southern South Atlantic group showed a decrease, but all other groups of states and territories showed a moderate increase. In circulation of monthly publications a decrease was shown in the Southern South Atlantic and the Western South Central groups; elsewhere in the United States the increase was very large.

While circulation was centralized, both for the 10 states mentioned as possessing a preponderance of the circulation, and for geographic divisions, no such centralization existed in number of establishments. New England and the Southern North Atlantic states possessed but 21.6 per cent of all establishments, while all except 4 of the states bordering on the Atlantic and Pacific oceans and the Great Lakes showed a per cent of increase less than the average increase for the United States.

The distribution of capital by geographic divisions varied radically from that of the number of establishments. In 8 out of 11 minor geographic divisions the proportion of the total capital reported was less in 1900 than in 1890. The only marked advance was in the Southern North Atlantic group, and this advance was made at the expense of nearly all the others. This fact suggests that the centralization of the industry made most rapid progress in this group. It should be noted that in all divisions the increase was large. So great, however, was the increase in capital in the group mentioned, that it materially affected the per cent of increase for the United States; this was 52.4 per cent, but for the United States, exclusive of the Southern North Atlantic group, it was only 39.3 per cent.

The value of products, considered by minor geographic divisions, showed greater uniformity than the other items mentioned. All divisions showed advances in 1900 except the Southern North Atlantic group.

Table 1 presents the totals, at the census of 1900, for the three classes into which this industry is divided. As already explained, complete separation was impracticable. The value of products for newspapers and periodicals includes the value of a large amount of job printing—shown in Table 5 to be $44,859,226. If this amount be added to $124,071,481, the combined value of products reported for book and job printing and the printing and publishing of music in Table 1, the resulting amount, $168,930,707, or 48.7 per cent of the total value of the products of the industry, represents that share which properly may be claimed for book and job printing, as distinguished from newspapers and periodicals; for the latter the value of products amounted to $175,789,610, or 50.7 per cent of the total. The remaining six-tenths of 1 per cent is a miscellaneous item which can not be classified.

TABLE 1.—SUMMARY BY CLASSES OF PRINTING AND PUBLISHING, 1900.

CLASSES.	Number of establishments.	Capital.	Salaried officials, clerks, etc. — Number.	Salaried officials, clerks, etc. — Salaries.	Wage-earners — Average number.	Wage-earners — Total wages.	Miscellaneous expenses.	Cost of materials used.	Value of products.
Total	22,312	$292,517,072	37,799	$36,090,719	162,992	$84,249,954	$55,897,529	$86,856,990	$347,055,050
Newspapers and periodicals	15,305	192,443,708	27,579	27,015,791	94,604	50,333,051	38,544,642	50,214,904	222,983,569
Book and job	6,920	97,759,398	9,906	8,830,413	67,610	33,541,701	16,690,190	36,191,712	121,799,096
Music	87	2,313,966	314	244,515	778	375,202	663,097	449,674	2,272,385

Classing the printing and publishing of music with book and job printing, the totals in Table 1 are divided between the two branches of the industry in the following proportions:

TABLE 2.—*Proportion in which the totals are divided between the two branches, 1900.*

	Newspapers and periodicals.	Book and job printing.
Number of establishments	68.6	31.4
Capital	65.8	34.2
Salaried officials, clerks, etc	73.0	27.0
Salaries	74.9	25.1
Wage-earners	58.0	42.0
Wages	59.7	40.3
Miscellaneous expenses	69.0	31.0
Cost of materials used	57.8	42.2
Value of products	64.3	35.7

It is here shown that newspapers and periodicals possessed a smaller proportion of capital than of number of establishments, indicating that the average capital per establishment was lower for that class than for book and job printing. Doubtless this is due to the fact, already explained, that book and job offices are generally located in the larger cities.

A comparison of the average capital, cost of materials, and value of products per establishment in the two main branches of the industry, not including the printing and publishing of music, is presented in Table 3.

TABLE 3.—*Comparison of the average capital, cost of materials, and value of products in the two main branches of the industry, 1900.*

	Newspapers and periodicals.	Book and job printing.
Capital	$12,574	$14,127
Cost of materials used	3,281	5,230
Value of products	14,569	17,601

From Table 1 it appears that 74.5 per cent of the value of all products of newspapers and periodicals was expended for wages, materials, and other items of expenditure, while the corresponding per cent for book and job printing was 78.2. In the newspaper and periodical class the cost of materials represented 22.5 per cent of the value of products, and in the book and job printing class 29.5 per cent, or about one-third greater. Were it possible to extricate from the statistics for the newspaper and periodical class the figures for book and job work produced in newspaper offices, it is probable the difference in these percentages would be still more significant. Newspapers and periodicals generally use inexpensive raw materials, while the materials required by the book and job printing office are varied and much more expensive.

If the ratio between cost of materials and value of products in the book and job printing class be applied to the value of book and job work produced in newspaper offices, it will appear that, of the total cost of materials shown in Table 5 for newspapers and periodicals, an expenditure of $36,891,714 was made for materials for newspapers and periodicals, and of $13,323,190 for those for book and job work produced in newspaper offices. According to these figures the cost of materials for newspapers and periodicals was 21 per cent of the value of newspaper products, and for book and job printing it was 29.7 per cent of the book and job products shown in Tables 1 and 5—indicating that the ratio of cost of materials to value of products was more than 40 per cent greater for book and job printing than for the printing and publishing of newspapers and periodicals.

Table 4 presents a comparative summary for the whole industry for 1890 and 1900. Comparison with the figures for the censuses of 1850 to 1880, although much to be desired, is impracticable. The figures for the earlier decades, and even some of those for 1880, are not comparable with those of the Eleventh and Twelfth censuses. The difficulty in separating the two parts of the industry, which already has been noted appears to have resulted in an underestimate of the number of establishments at one or more censuses. This, with other points of difference, renders the figures for 1850 to 1880, inclusive, practically valueless for purposes of comparison.

TABLE 4.—*Comparative summary of printing and publishing, 1890 and 1900, with per cent of increase.*

	1900	1890	Per cent of increase.
Number of establisbments	22,312	16,566	34.7
Capital	$292,517,072	$195,387,445	49.7
Salaried officials, clerks, etc., number	37,799	[1]28,391	33.1
Salaries	$36,090,719	[1]$26,272,756	37.4
Wage-earners, average number	162,992	136,836	19.1
Total wages	$84,249,954	$78,810,319	6.9
Men, 16 years and over	125,964	110,434	14.1
Wages	$74,288,521	$71,310,415	4.2
Women, 16 years and over	28,765	19,026	51.2
Wages	$8,878,073	$6,604,046	34.4
Children, under 16 years	8,263	7,336	12.0
Wages	$1,083,360	$895,858	20.9
Miscellaneous expenses	$55,897,929	$46,971,768	19.0
Cost of materials used	$86,856,290	$68,[illegible]58,915	26.1
Value of products	$347,055,050	$275,452,515	26.0

[1] Includes proprietors and firm members, with their salaries; number only reported in 1900.

The figures for all the items appearing in Table 4 have become so great that a small per cent of increase now represents an absolute increase greater than that shown by a relatively high per cent in earlier decades. While the percentages of increase for the several items are very moderate, the absolute increases are gratifyingly large.

For the censuses from 1850 to 1880, inclusive, the statistics of capital were regarded, even at the time of enumeration, as difficult to secure and of uncertain value. Gen. F. A. Walker, Superintendent of the Ninth Census, expressed this opinion: "No man in business knows what he is worth; far less can he say what portion of his estate is to be treated as capital."[1] Prior to 1890 the inquiry concerning capital was a general one, different in form from that now employed.

NEWSPAPERS AND PERIODICALS.

A comparative summary of the figures relating to newspapers and periodicals, from 1880 to 1900, inclusive, is presented in Table 5.

To some extent this table also illustrates the difficulty of making satisfactory comparisons prior to 1890. Out of 23 items shown for 1890 and 1900, only 9 were reported in 1880, the number of establishments, capital, and certain other items being omitted.

TABLE 5.—*Comparative summary of newspapers and periodicals, 1880 to 1900, with per cent of increase for each decade.*

	DATE OF CENSUS.			PER CENT OF INCREASE.	
	1900	1890	1880	1890 to 1900	1880 to 1890

	DATE OF CENSUS.			PER CENT OF INCREASE.	
	1900	1890	1880	1890 to 1900	1880 to 1890
Number of publications[1]	18,226	14,901	10,132	22.3	47.1
Aggregate circulation per issue[2]	114,299,334	69,138,934	31,779,686	65.3	117.6
Aggregate number of copies issued during the census year[3]	8,168,148,749	4,681,113,530	2,067,848,209	74.5	126.4

[1] Does not include certain publications which did not report operations as follows: In 1880, 1,182; in 1890, 2,715; in 1900, 3,046.
[2] "Aggregate circulation per issue" is the sum of the totals for the average circulation per issue reported by each establishment.
[3] Obtained for each class of publication by multiplying the aggregate circulation per issue by the number of issues during the year.

PUBLICATIONS NOT REPORTING.

In any discussion of the statistics of newspapers and periodicals, early reference should be made to the number of publications from which no report was received.

The numbers reporting and not reporting at the censuses of 1880, 1890, and 1900 were as follows:

TABLE 6.—*Publications reporting and not reporting, 1880 to 1900.*

YEAR.	NUMBER OF PUBLICATIONS.			Per cent those not reporting form of total.
	Total.	Reporting.	Not reporting.	
1900	21,272	18,226	3,046	14.3
1890	17,616	14,901	2,715	15.4
1880	11,314	10 132	1,182	10.4

The number of publications classed as not reporting was ascertained by reference to the standard newspaper directories. By this method of comparison it appears that at the Twelfth Census the number of publications not reporting amounted to 14.3 per cent of the total, a proportion slightly less than that for 1890. Of the 3,046 publications stated as not reporting, a considerable number undoubtedly had gone out of existence; many others were so small and unimportant that they were in no respect a factor in this enumeration; and still others were doubtless of a class not reported by the census. It is clear, therefore, that the number of unreported publications which, by reason of standing, capital, and value of products, were entitled to consideration, was so small that had the totals been obtained, they would have but slight influence upon the figures presented in this report. Therefore, the publications not reporting in 1900 will be regarded as a negligible quantity.

NUMBER OF ESTABLISHMENTS AND PUBLICATIONS.

As the census of 1880 did not record the number of establishments, the figures relating to this subject can be compared only for 1890 and 1900. The proportion of establishments to publications remained practically stationary during the decade, being 82.9 to every 100 publications in 1890, and 84 in 1900. In the absence of information concerning the number of establishments in 1880, it is interesting to observe that if the ratio for 1880 was the mean of those given above, the number of establishments in 1880 was approximately 8,450, but for obvious reasons no statistical value can be claimed for this figure.

By considering here the details presented in Table 58 concerning number of establishments, it appears that 9,686, or 63.3 per cent of the total number, were owned and operated by individuals; 3,016, or 19.7 per cent, were owned and operated by some form of partnership; and 2,603, or 17.0 per cent, were owned and operated by corporations (including 183 miscellaneous forms of ownership). These figures indicate the complete absence of the extended combinations and consolidations so frequently encountered in other industries.

Comparison of Tables 4 and 5 reveals the fact that the increase in the number of all establishments, 34.7 per cent, was more rapid than in the number in the newspaper and periodical class, which increased 23.8 per cent. This is due to the marked growth in the number of establishments in the book and job printing class, which increased 67.8 per cent.

It appears from Table 5 that the increase in the number of publications was less rapid from 1890 to 1900 than during the previous decade, and that the increase in the total number of copies of newspapers and periodicals issued during the census year, though very large, amounting to 74.5 per cent, was much less than that shown in 1890, which amounted to 126.4 per cent.

CAPITAL.

Analysis of the statistics of capital and products presented in Table 5, is given below:

TABLE 7.—*Average capital, average value of products, and per cent that value of products forms of capital, 1890 and 1900.*

YEAR.	Average capital.	Average value of products.	Per cent that value of products forms of capital.
1900	$12,574	$14,569	115.9
1890	10,214	14,549	142.4

In 1890 the average capital was $10,214, and in 1900 it was $12,574, an increase of 23.1 per cent. The average value of products, however, was almost stationary; therefore, the per cent of value of products to capital, which was 142.5 in 1890, fell to 115.9 in 1900. These figures are confirmatory of a change especially characteristic of the last decade, by which increasing capital is required to produce the same or even a smaller value of products.

Comparison of Tables 4 and 5 also shows that the increase in capital in newspaper and periodical establishments, 52.4 per cent, was more rapid than in all establishments, in which it was 49.8 per cent.

WAGE-EARNERS.

Table 5 shows that during the decade from 1890 to 1900 the total number of employees in the newspaper and periodical class increased 10 per cent. Table 8 shows the changes in the proportion of men, women, and children employed.

TABLE 8.—*Total number of wage-earners, and proportion of men, women, and children employed, 1890 and 1900.*

YEAR.	Total wage-earners.	PER CENT OF TOTAL.		
		Men.	Women.	Children.
1900	94,604	77.8	15.7	6.5
1890	85,975	81.9	11.2	6.9

The proportion of women to the total number increased from 11.2 to 15.7, a difference of 4.5 per cent. This gain was made practically at the expense of male wage-earners, the proportion of whom decreased from 81.9 to 77.9, a difference of 4.0 per cent. The proportion of children employed for wages remained practically stationary.

It has been explained in Volumes VII and VIII of the Twelfth Census Reports that for comparative purposes the figures for 1890 and 1900 relating to wage-earners and wages are less trustworthy than other items reported, because of changes in classification. In the reports mentioned these changes are explained in detail. Should the figures given in Table 5 be accepted as permitting an approximate comparison, it would appear that an increase of 10 per cent in wage-earners secured an increase of 24 per cent in value of products, and that the absolute increase in male wage-earners was but 3,229, while the absolute increase in female wage-earners was 5,228. Indeed, the latter figure would have been even larger had the age classification remained the same in 1900 as in 1890.

VALUE OF PRODUCTS.

The total value of all products of newspaper and periodical establishments increased $43,123,819, or 24 per cent, between 1890 and 1900. Of the items composing the total value of products, by far the lowest increase, 10.5 per cent, was shown for "subscriptions and sales." This fact, taken in connection with the decided increase in the amount of paper used, illustrates one of the marked features of the development of the industry—the increase in the number of pages issued by almost all newspapers and magazines. The causes of this increase in the size of publications are discussed elsewhere in this report.

Of the total value of products given in Table 5, advertising forms 43 per cent, subscriptions and sales 35.8 per cent, and book and job printing and all other products together 21.2 per cent. Of these three items book and job printing shows the largest per cent of increase during the last decade. Comparison of the percentages of increase in advertising and in subscriptions and sales for the decades from 1880 to 1890 and from 1890 to 1900 shows a shrinkage from 82 per cent to 34.6 per cent in the former and from 45.1 per cent to 10.5 per cent in the latter.

The decline in the relative importance of subscriptions and sales and the advance of advertising are clearly shown for three census years in Table 9.

TABLE 9.—*Proportion which advertising and subscriptions and sales form of total value of newspaper products, 1880 to 1900.*

YEAR.	Advertising, per cent.	Subscriptions and sales, per cent.
1900	54.5	45.5
1890	49.6	50.4
1880	44.0	56.0

A comparison, for 1890 and 1900, of the proportion contributed to the total value of all products by the two items referred to above, shows a decline in subscriptions and sales, an advance in advertising, and also a slight advance in book and job printing.

TABLE 10.—*Proportion which advertising, subscriptions and sales, and book and job printing form of the total value of all products, 1890 and 1900.*

YEAR.	Per cent which advertising forms of value of products.	Per cent which subscriptions and sales form of value of products.	Per cent which book and job printing forms of value of products.
1900	43.0	35.8	21.2
1890	39.6	40.2	20.2

Tables 9 and 10 establish the important fact that publishers are depending more on advertising and less on subscriptions and sales for financial return. This conclusion is confirmed by the fact that the most notable increases for the past decade, shown in Table 5—except that for paper, already referred to—are in "aggregate circulation per issue" and "aggregate number of copies issued during the census year," suggesting the conclusion that the publishers of newspapers and periodicals, pushed by competition and by the necessity for an increase of circulation to meet the exactions of the advertiser have increased their capital and forced a larger circulation, which has not shown a proportionate increase in the financial return.

PERIOD OF ISSUE AND CHARACTER OF PUBLICATION.

Publications are classified in Table 11 by period of issue and by character.

TABLE 11.—*Classified according to period of issue and character of publication, 1880 to 1900, with per cent of increase for each decade.*

	NUMBER OF PUBLICATIONS REPORTING.			PER CENT OF INCREASE.	
	1900	1890	1880	1890 to 1900	1880 to 1890
Total	18,226	14,901	[1]11,314	22.3	31.7
Period of issue:					
Daily	2,226	1,610	971	38.3	65.8
Triweekly	62	84	73	82.4	[2]53.4
Semiweekly	637	194	133	228.3	45.9
Weekly	12,979	10,814	8,633	20.0	25.3
Monthly	1,817	1,734	1,167	4.8	48.6
Quarterly	237	225	116	5.3	94.0
All other classes	268	290	221	[2]7.6	31.2
Character of publication:					
News, politics, and family reading	14,867	11,326	8,863	31.3	27.8
Religion	952	1,025	553	[2]7.1	85.4
Agriculture, horticulture, dairying, and stock raising	307	263	173	16.7	52.0
Commerce, finance, insurance, railroads, and trade	[3]710	671	363	5.8	84.8
General literature, including magazines	239	291	189	[2]17.9	54.0
Medicine and surgery	111	123	114	[2]9.8	7.9
Law	62	47	45	31.9	4.4
Science and mechanics	66	83	68	[2]20.5	22.1
Fraternal organizations	200	216	149	[2]7.4	45.0
Education and history	[4]259	256	248	1.2	3.2
Society, art, music, and fashion	88	152	72	[2]42.1	111.1
Miscellaneous	[5]365	448	477	[2]18.5	[2]6.1

[1] Includes 1,182 publications not reporting operations, as they can not be excluded from the classification.
[2] Decrease.
[3] Includes 520 "trade journals."
[4] Includes 139 "college and school periodicals."
[5] Includes 72 "Sunday newspapers."

It will be observed from Table 11 that while the triweekly, a class with unimportant totals, suffered a severe decline during the decade from 1880 to 1890, the other classes of publications under "period of issue" increased by percentages ranging from 25.3 to 94. In the decade from 1890 to 1900 there were no decreases, but the increases recorded for the daily, weekly, monthly, and quarterly classes were much smaller than for the same classes during the preceding decade. The most noteworthy increase was in the semiweekly publications, of which there were 133 in 1880, 194 in 1890, and 637 in 1900. The increase shown at the last-named date was 443 publications, or 228.4 per cent. This is in marked contrast to the moderate advances recorded for the other classes, and doubtless reflects an effort, on the part of a considerable number of publishers of weekly newspapers in towns located near large cities, to overcome the injurious effects of competition with city dailies. There have been many instances, during the decade, in which a weekly has been advanced to a semiweekly, thus doubling the number of issues with little or no increase in the subscription price.

As shown by this table, the absolute increase in the number of publications during the decade was 3,325. For the decade ending in 1890 the per cent of increase in the number of all publications was greater than the per cent of increase in population, the former being 31.7 per cent and the latter 24.9. In the decade from 1890 to 1900 the percentages for both items decreased, becoming 22.3 for all publications and 20.7 for population—a similarity which, while interesting, was doubtless merely a coincidence. It is worthy of note, however, that for two decades the per cent of increase in the number of daily newspapers has been nearly the same as the per cent of increase in urban population. The foregoing facts, together with the number of ininhabitants to each publication, are presented in Table 12.

TABLE 12.—*Number of inhabitants to each publication, 1880 to 1900, and per cent of increase for each decade in urban population and in number of daily newspapers.*

YEAR.	Number of inhabitants to each publication.	PER CENT OF INCREASE IN PRECEDING DECADE.	
		In urban population.	In number of daily newspapers.
1900	4,170	36.8	38.3
1890	4,224	61.4	65.8
1880	4,433	....	....

The two following tabular comparisons give the percentage which each class forms of the total number of publications for 1880, 1890, and 1900, when classified by "period of issue" and by "character of publication."

TABLE 13.—*Per cent that each class, by period of issue, forms of total number of publications, 1880 to 1900.*

PERIOD OF ISSUE.	1900	1890	1880
Daily	12.2	10.8	8.6
Triweekly	0.3	0.2	0.6
Semiweekly	3.5	1.3	1.2
Weekly	71.2	72.6	76.3
Monthly	10.0	11.6	10.3
Quarterly	1.3	1.5	1.0
All other classes	1.5	2.0	2.0

TABLE 14.—*Per cent that each class, by character of publication, forms of total number of publications, 1880 to 1900.*

CHARACTER OF PUBLICATION.	1900	1890	1880
News, politics, and family reading	81.6	76.0	78.3
Religion	5.2	6.9	4.9
Agriculture, horticulture, dairying, and stock raising	1.7	1.8	1.5
Commerce, finance, insurance, railroads, and trade	3.9	4.5	3.2
General literature, including magazines	1.3	2.0	1.7
Medicine and surgery	0.6	0.8	1.0
Law	0.3	0.3	0.4
Science and mechanics	0.4	0.6	0.6
Fraternal organizations	1.1	1.4	1.3
Education and history	1.4	1.7	2.2
Society, art, music, and fashion	0.5	1.0	0.7
Miscellaneous	2.0	3.0	4.2

From Table 13 it will be observed that for the twenty-year period from 1880 to 1900 the daily, the semiweekly, and the quarterly show small relative advances, and the weekly and the monthly show small declines. The changes shown for the past decade are of especial interest; the quarterly falls out of the advancing class, but the daily and the semiweekly continue to show moderate advances, made at the expense of the quarterly as well as of the weekly and the monthly. This result is a manifestation of the energetic and impatient spirit of the period.

Examination of the above comparison of character of publications reveals the fact that during the decade from 1880 to 1890 there was a slight decline in the relative importance of publications devoted to news, politics, and general reading, but that publications devoted to religion, to agriculture and kindred pursuits, to business interests, to general literature, to fraternal orders, and to society, art, music, and fashion, benefiting by the decline of the first-named class, showed small advances. The figures for the Twelfth Census show that a marked change took place during the last decade. The advance of publications devoted to special subjects was checked, while those devoted to news, politics, and general reading made a decided relative increase at the expense of all others, except those devoted to law, a relatively insignificant class, which remained stationary. The reason for the change thus indicated is unmistakable. Publications devoted to specialties slowly yielded ground to the large daily newspapers, which invaded every field of journalism.

This noteworthy situation seems to have been due principally to three causes: The resistless activity of the period, which made the Sunday edition of the daily newspaper a department store of journalism, ransacking all lines of thought and every public interest for material to present; the perfection of the composing machine, by the use of which one competent operator can accomplish the work of from 5 to 10 compositors; and the development of the inexpensive and satisfactory methods of illustration known as the "line cut" and the "half-tone," which made possible the rapid transference of a photograph to the columns of a newspaper.

It is impossible to measure the effect of the invention of mechanical composition. If it were not for the entirely new situation which it produced, the will and the ability to expand the daily from old-fashioned proportions might have struggled in vain against the high cost of hand composition, notwithstanding the mental activity of the period. The daily press and many other periodicals have been prompt to seize upon this advance in the industry, and are now equipped for machine composition. In this manner a revolution has been accomplished in the output of many publications; the number of printed pages has been greatly increased; the freer use of composition has made possible the introduction of departments or columns devoted to periodic or even daily consideration of special subjects, often cleverly treated; and the daily paper, or the Sunday edition of the daily, has to some extent supplanted publications devoted to specialties. The reading matter now presented is not only satisfying to the reader, but, in amount, often beyond his capacity to assimilate. This is true especially of many of the Sunday publications, which varied in 1900 from 24 to 120 pages, with special departments or supplements devoted to leading subjects, such as literature, art, religion, science, sports, music, the drama, etc.

Table 15 presents the number and circulation of newspapers and periodicals, classified according to period of issue, from 1850 to 1900.

Table 15.—NUMBER AND CIRCULATION OF NEWSPAPERS AND PERIODICALS, CLASSIFIED ACCORDING TO PERIOD OF ISSUE, 1850 TO 1900.

YEAR.	ALL CLASSES.			DAILY.		TRIWEEKLY.		SEMIWEEKLY.	
	Number.	Total circulation per issue.	Aggregate number of copies issued during the census year.	Number.	Total circulation per issue.	Number.	Total circulation per issue.	Number.	Total circulation per issue.
1900	18,226	114,299,334	[1]8,168,148,749	2,226	15,102,156	62	228,610	637	2,832,868
1890	14,901	69,138,934	4,681,113,530	1,610	8,387,188	34	50,067	194	561,743
1880	[2]11,314	[3]31,779,686	2,067,848,209	971	3,566,395	73	68,086	133	264,910

1850	2,526	5,142,177	426,409,978	254	758,454	115	75,712	31	53,511

YEAR.	WEEKLY.		MONTHLY.		QUARTERLY.		ALL OTHER CLASSES.[4]	
	Number.	Total circulation per issue.	Number.	Total circulation per issue.	Number.	Total circulation per issue.	Number.	Total circulation per issue.
1900	12,979	39,852,052	1,817	39,519,897	237	11,217,422	268	5,546,329
1890	10,814	28,954,515	1,734	19,624,038	225	8,124,500	290	3,436,888
1880	8,633	[3]16,266,830	1,167	[3]8,139,881	116	[3]1,944,299	221	[3]1,379,285
1870	4,295	10,594,643	622	5,650,843	49	211,670	109	1,381,470
1860	3,173	7,581,930	280	3,411,959	30	101,000	16	807,750
1850	1,902	2,944,629	100	740,651	19	25,875	105	543,345

[1] Obtained, for each class of publications, by multiplying the average circulation for each issue by the number of issues during the year.
[2] Includes 1,182 publications not reporting circulation, as they can not be excluded from the classification.
[3] The circulation of 5 weeklies, 1 semimonthly, 14 monthlies, and 12 quarterlies not reported separately, amounting to 150,000, is given only for "all classes."
[4] Includes publications issued semimonthly, semiannually, annually, etc.

By dividing a total circulation of 100 per cent proportionately among the different classes, for a period of half a century, the following results are obtained:

TABLE 16.—*Per cent that circulation per issue of each class forms of total circulation per issue, 1850 to 1900.*

PERIOD OF ISSUE.	1900	1890	1880	1870	1860	1850
All classes	100.0	100.0	100.0	100.0	100.0	100.0
Daily	13.2	12.1	11.2	12.5	10.8	14.7
Triweekly	0.2	0.1	0.2	0.8	0.8	1.5
Semiweekly	2.5	0.8	1.9	1.2	1.3	1.0
Weekly	34.9	41.9	51.2	50.8	55.5	57.3
Monthly	34.6	28.4	26.0	27.1	25.0	14.4
Quarterly	9.8	11.7	6.1	1.0	0.7	0.5
All other classes	4.8	5.0	4.4	6.6	5.9	10.6

From Table 16 it will be observed that the daily class, after fluctuating during the period from 1850 to 1880, advanced from 11.2 per cent in 1880 to 13.2 per cent in 1900; that the weekly declined steadily in relative importance from 57.3 per cent, or more than half of the circulation of all newspapers and periodicals, in 1850, to 34.9 per cent in 1900. Of the other classes the most notable change in circulation was shown by the monthlies, which advanced 6.2 per cent during the last decade. It is probable that this change is due to the establishment of inexpensive magazines, which have a large circulation, and which, in their present perfection, are distinctly a product of the decade from 1890 to 1900. Among the causes which have made them possible are cheapened composition and illustration, and the improvements in the manufacture of printing presses.

TABLE 17.—*Absolute increase in the total circulation per issue of each class, 1850 to 1900.*

PERIOD OF ISSUE.	1890 to 1900	1880 to 1890	1870 to 1880	1860 to 1870	1850 to 1860
All classes	45,160,400	37,359,248	10,937,211	7,179,066	8,521,232
Daily	6,714,968	4,820,793	964,848	1,123,112	719,981
Triweekly	178,543	[1]18,019	[1]87,019	47,935	31,458
Semiweekly	2,271,125	296,833	17,713	72,032	121,654
Weekly	10,897,537	12,687,685	5,672,187	3,012,713	4,637,301
Monthly	19,895,859	11,484,157	2,489,038	2,238,884	2,671,308
Quarterly	3,092,922	6,180,201	1,732,629	110,670	75,125
All other classes	2,109,446	2,057,598	[1]2,185	573,720	264,405

[1] Decrease.

This comparison, drawn from Table 15, throws additional light upon the increase in the circulation of newspapers and periodicals during the past decade. With the exception of the weekly and the quarterly, each class showed a greater absolute increase from 1890 to 1900 than during any other decade of the half century. For both the weekly and the quarterly, the increase during the decade from 1890 to 1900 was exceeded only by that of the preceding decade. This statement emphasizes the rapid growth in the circulation of monthly publications. The normal increase in the circulation of this class of periodicals, which during the twenty years from 1860 to 1880 remained nearly constant at about 2,500,000, advanced in 1890 to 11,484,157, and in 1900 this figure was almost doubled, the absolute increase being 19,895,859.

TABLE 18.—*Aggregate circulation per issue of daily, weekly, and monthly publications, and circulation per 1,000 inhabitants, 1880 to 1900.*

PERIOD OF ISSUE.	AGGREGATE CIRCULATION PER ISSUE.			CIRCULATION PER 1,000 INHABITANTS.		
	1900	1890	1880	1900	1890	1880

Weekly	39,852,052	28,954,515	16,266,830	524	460	324
Monthly	39,519,897	19,624,038	8,139,881	520	312	162

From Table 18 it appears that the total circulation per issue of daily newspapers was sufficient to supply about one in every five inhabitants, and of weeklies and monthlies each about one in every two inhabitants. In this respect the increase was most marked in the monthly class.

The average circulation per issue of newspapers and periodicals, by period of issue, from 1880 to 1900, is presented in Table 19.

TABLE 19.—*Average circulation per issue, 1880 to 1900.*

PERIOD OF ISSUE.	AVERAGE CIRCULATION PER ISSUE.		
	1900	1890	1880
All classes	6,271	4,640	3,122
Daily	6,784	5,209	4,137
Triweekly	3,687	1,473	1,001
Semiweekly	4,447	2,896	2,136
Weekly	3,071	2,678	2,113
Monthly	21,750	11,317	7,834
Quarterly	47,331	36,109	16,505
All other classes	20,695	11,851	6,474

Representing by percentages the fluctuations shown in this table, the movement of circulation for the past two decades was as follows:

TABLE 20.—*Per cent of increase in average circulation, by periods of issue, from 1880 to 1890 and from 1890 to 1900.*

PERIOD OF ISSUE.	1890 to 1900	1880 to 1890
All classes	35.2	48.6
Daily	30.2	25.9
Triweekly	150.3	47.2
Semiweekly	53.6	35.6
Weekly	14.7	26.7
Monthly	92.2	44.5
Quarterly	31.1	118.8
All other classes	74.6	83.1

The tendencies already pointed out appear again in this comparison. Of the important classes, the daily, semiweekly, and monthly show decided advances in the percentage of increase in average circulation during the decade just ended, while the weekly shows a marked decline.

PUBLICATIONS IN DIFFERENT LANGUAGES.

Table 21 presents an interesting classification of the total number of publications reported, into the languages in which they are published.

TABLE 21.—*Newspapers and periodicals classified according to language in which printed, 1880 to 1900.*

LANGUAGE.	NUMBER OF PUBLICATIONS. 1900	1890	1880
Total	18,226	14,901	[1] 11,314
English	17,194	13,848	10,515
Armenian	....	1	....
Bohemian	28	22	13
Bohemian and English	1	1	....
Catalan	....	....	1
Chinese	5	3	2
Dutch	12	16	9
Finnish	7	4	....
French	27	40	41
French and English	4	5	....
Gaelic	....	1	....
Gaelic and English	3	3	....
German	613	727	641
German and English	20	27	....
German and Hebrew	3	4	....
Hebrew	13	5	....
Hungarian	2	1	....
Indian and English	3	1	3
Irish	....	....	1
Italian	35	13	4
Italian and English	....	1	....
Lithuanian	9	1	....
Polish	33	18	2
Portuguese	2	2	2
Scandinavian [2]	115	112	49
Slavonic, not specified	4	2	....
Spanish	39	29	26
Spanish and English	1	7	....
Volapuk	....	1	....
Volapuk and English	....	1	....
Welsh	....	4	5
Welsh and English	1	1	....
All other languages	52	....	....

[1] Includes 1,182 publications not reporting operations, as they can not be excluded from the classification.
[2] Includes Danish, Norwegian, and Swedish.

There were 15 different languages or combinations of languages represented in 1880, 30 in 1890, and 25 in 1900. The principal languages in which increases in the number of periodicals published were shown in 1900, were English, Bohemian, Hebrew, Italian, Polish, Scandinavian, and Spanish. Decreases were shown in the number of periodicals published in Dutch, French, and German. The languages represented by publications in 1880 or in 1890, but not in 1900, were Armenian, Catalan, Gaelic, Irish, "Volapuk," and Welsh. The proportion of the total number of publications printed in each of the principal languages in 1880, 1890, and 1900 is best shown by percentages, as follows:

TABLE 22.—*Per cent that number of publications in each of the principal languages forms of the total number, 1880 to 1900.*

LANGUAGE.	1900	1890	1880
English	94.3	92.9	92.9
Bohemian	0.2	0.2	0.1
French	0.2	0.3	0.4
German	3.4	4.9	5.7
Italian	0.2	0.1	....
Polish	0.2	0.1	....
Scandinavian	0.6	0.8	0.4
Spanish	0.2	0.2	0.2

In 1880, 92.9 per cent of all publications were printed in English; in 1890, although the number of languages or combinations represented was doubled, the proportion of periodicals printed in English remained unchanged; but in 1900 it had advanced to 94.3 per cent. This advance is significant, when considered in connection with the accompanying decrease from 7.1 per cent in 1890 to 5.7 per cent in 1900 in the proportion of publications printed wholly or in part in other languages. On closer examination of Table 22 it will be observed that during the past decade there was an increase in the proportionate number of publications printed in Italian and in Polish; that there was a decline in the relative importance of publications printed in French, German, and the Scandinavian tongues; and that the proportion of publications printed in Bohemian and Spanish remained the same in 1900 as in 1890.

By considering the percentages of increase or decrease in the number of publications printed in the principal languages, in connection with the statistics of population born in the countries in which those languages are spoken, additional light is thrown on the figures presented in Table 21.[1]

TABLE 23.—*Comparison of the per cent of increase or decrease in the number of publications printed wholly or partly in the principal foreign languages, with the per cent of increase or decrease in population born in the countries in which those languages are spoken, from 1880 to 1890 and from 1890 to 1900.*

COUNTRY.	PER CENT OF INCREASE OR DECREASE IN NUMBER OF PUBLICATIONS. 1890 to 1900	1880 to 1890	PER CENT OF INCREASE OR DECREASE IN FOREIGN BORN POPULATION. 1890 to 1900	1880 to 1890
France	[1] 31.1	9.8	[1] 7.8	5.8
Germany	[1] 16.0	17.6	[1] 4.2	41.6
Italy	150.0	250.0	165.2	312.8
Poland and Russia	85.0	900.0	144.7	291.1
Scandinavia	2.7	128.6	14.0	112.0

[1] Decrease.

The percentages of increase and decrease in number of publications appearing in Table 23, though based upon figures too small to be of any value in themselves, are of great interest in comparison with the percentages given in the second part of the statement, because they indicate the degree of sympathy existing between the increase or decrease in the number of publications printed in the language and devoted to the interests of any one country, and the movement of emigration from that country. From these figures it is reasonable to conclude that publications of this character depend for support, to a large extent, upon comparatively recent arrivals, and that in general, when emigration from a country decreases, the number of publications printed in the language of that country decreases, and when immigration shows an increase the number of publications also increases. In 1900 the Scandinavian countries furnished the only exception to the conclusion that immigrants, after settling in the United States, soon lose interest in their native land to the extent of ceasing to support publications printed in their mother tongue. The immigration of Scandinavians decreased, while the

[1] Twelfth Census, Population, Part I, page clxxi.

number of publications printed in the Scandinavian languages showed a slight increase.

If the number of residents of the United States in 1900 reporting birth in each of six important foreign countries be divided by the total number of publications printed in the language of their native country, the following figures appear:

TABLE 24.—*Number of residents of the United States born in specified countries to each publication printed in the languages of those countries, 1880 to 1900.*

COUNTRY.	1900	1890	1880
Bohemia	5,413	5,135	6,566
France	3,366	2,515	2,609
Germany	4,213	3,693	3,068
Holland	8,754	6,114	6,454
Italy	13,834	13,041	11,058
Scandinavia	9,255	8,333	8,985

It will be recalled that the number of inhabitants to each publication in 1900 has been shown to be 4,169. From Table 24 it appears that the number of residents of the United States in 1900 born in each of the above-named countries, except France and Germany, to each publication printed in their native tongue, was much larger than the average for the United States. In each case, also, the figures for 1900 show an increase over 1890—that is, a decrease in the proportionate number of publications printed in the language of each of these countries to the number of natives of each residing in the United States.

QUANTITY AND COST OI PAPER USED.

Table 25 shows the quantity and cost of paper used, and the average cost per pound, in 1900.

TABLE 25.—*Quantity, cost, and average cost per pound of paper used, 1900.*

KIND.	Pounds.	Cost.	Average cost per pound (cents).
Total	1,233,142,248	$37,823,856	3.1
News	956,335,921	22,197,060	2.3
Book and periodical	202,296,263	9,356,490	4.6
Job printing	74,510,054	6,270,306	8.4

In this table is presented a division of the paper used in 1900, according to the several classes of products which, combined, produced the total value of products of newspaper and periodical establishments. About one and a quarter billions of pounds were used during the census year. This large quantity was utilized in the following proportions:

	Per cent.
News	77.6
Book and periodical	16.4
Job printing	6.0

It is important, however, to observe that these proportions in weight do not by any means hold good in cost. The latter shows the following proportions:

	Per cent.
News	58.7
Book and periodical	24.7
Job printing	16.6

TABLE 26.—*Per cent that quantity and cost of paper used form of total, 1890 and 1900.*

KIND.	QUANTITY.		COST.	
	1900	1890	1900	1890
Newspapers	77.6	74.1	58.7	61.1
Books and periodicals	16.4	25.9	24.7	38.9
Job printing	6.0		16.6	

It is clear that while the quantity of paper used for newspapers far exceeds that consumed in the other branches of the industry, it is proportionately much less expensive.

The average cost per pound shown in Table 25 adds confirmation to the deduction drawn from Table 5, that the cost of materials for book and job work was over 40 per cent greater than that for newspapers and periodicals. If the item of paper alone were considered, this per cent would be increased. The average cost per pound of paper consumed by newspapers and periodicals combined was 2.3 cents. The average cost per pound of paper for books and periodicals and job printing combined was 5.6 cents.

VALUE OF PRODUCTS.

The items composing the total value of products of newspaper and periodical establishments are presented in detail in Table 27.

TABLE 27.—*Value of products, with per cent which each class forms of the total, 1900.*

	Value.	Per cent of total.
Total	$222,983,569	100.0
Newspaper products:		
Advertising	95,861,127	43.0
Subscriptions and sales	79,928,483	35.9
Book and job printing products:		
Book and pamphlet publications	18,407,528	8.3
Sheet music and books of music	544,802	0.2
Job printing	22,793,322	10.2
Bookbinding	2,067,450	0.9
Blank books	554,557	0.3
Electrotyping, engraving, etc	491,567	0.2
All other products	2,334,733	1.0

The relative importance of these items was considered at some length under Table 5.

RANK OF STATES AND TERRITORIES ACCORDING TO CIRCULATION.

In Table 28 is shown the rank of the several states and territories, according to aggregate circulation, in each class of newspapers and periodicals, by period of issue. This table is of interest as showing relative position at the Twelfth Census, but obviously presents nothing of statistical value, since a decline in rank does not necessarily imply a decrease in aggregate circulation, but may be due, on the contrary, to greater increase of population, or greater increase in the circulation of publications of other classes, or in other sections of the country.

TABLE 28.—RANK OF STATES AND TERRITORIES ACCORDING TO AGGREGATE CIRCULATION PER ISSUE OF NEWSPAPERS AND PERIODICALS, 1900.

STATES AND TERRITORIES.	All classes.	Daily.	Triweekly.	Semi-weekly.	Weekly.	Monthly.	Quarterly.	All other classes.
Alabama	32	30	16	37	32	38		20
Arizona	47	45			48	49

New Jersey	9	12		39	18	29	8	1
New Mexico	49	48			47	48	29	32
New York	1	1	1	1	1	1	1	2
North Carolina	29	31		19	25	34	30	27
North Dakota	39	41		32	38	36		
Ohio	4	4	3	4	4	6	3	3
Oklahoma	42	44		46	39	45		40
Oregon	26	29		25	28	21		31
Pennsylvania	2	2	4	3	3	3	2	8
Rhode Island	36	21	22	33	44	44	22	
South Carolina	38	40	20	21	36	35		36
South Dakota	31	42		42	34	28		13
Tennessee	8	16		31	7	14	5	23
Texas	19	19		10	13	24	27	24
Utah	41	39	11	17	46	32	32	19
Vermont	35	38		29	37	27	31	22
Virginia	22	26	9	26	22	19	9	25
Washington	27	27	19	30	29	26	19	30
West Virginia	33	32		35	27	41		38
Wisconsin	15	14	14	8	11	18	12	16
Wyoming	48	50	19	45	49	37		

It will be observed that the four most populous states—New York, Pennsylvania, Illinois, and Ohio—maintain the same rank in aggregate circulation that they do in population. At that point uniformity in rank ceases, except in the case of Nevada, which is last in rank, both in population and in aggregate circulation.

Table 29 presents statistics relating to daily publications in 50 cities, for 1900; Table 30 gives the same information for 27 cities, for 1880, 1890, and 1900.

TABLE 29.—STATISTICS RELATING TO DAILY PUBLICATIONS IN 50 CITIES, 1900.

[1] Not reported separately.

DAILY NEWSPAPERS IN LARGE CITIES.

Scrutiny of Table 29 reveals the fact that in the 50 largest cities in the United States in 1900 there were published 451 daily newspapers, of which 204 were published in the morning and 247 in the evening, showing an excess of 43, or 17.4 per cent, for evening publications. The average number of dailies per city was 9—4.1 for morning and 4.9 for evening newspapers. Six cities reported the same number of morning as of evening newspapers; 14 cities reported more morning than evening newspapers; and 28 cities reported a greater number of evening than morning newspapers. An examination of the data given in Table 30 reveals the following figures:

TABLE 31.—*Number of morning and evening daily newspapers in 26 cities, with number of cities showing excess in each class, 1880 to 1900.*

YEAR.	DAILY NEWSPAPERS.			NUMBER OF CITIES SHOWING EXCESS IN—		Number of cities showing no difference.
	Total.	Morning.	Evening.	Morning.	Evening.	
1900	332	157	175	8	15	3
1890	309	163	146	11	12	3
1880[1]	217	124	93	15	4	2

[1] Five cities not separately reported.

Table 31 presents an interesting proof that evening newspapers have been increasing more rapidly than morning newspapers. In 1880, 21 leading cities reported 124 morning dailies and 93 evening dailies. In 1900 the same cities, with 5 new ones added because of increase in population, reported 157 morning newspapers and 175 evening newspapers—an increase of 33 publications in the former class and of 82 in the latter. Considering the cities as units, 15 out of 21 showed, in 1880, an excess of morning dailies, and 4, an excess of evening dailies, while in 2 cities the classes were equal. Out of the 26 largest cities in the United States in 1900, 15 showed an excess of evening publications and 8 an excess of morning publications, and 3 reported the same number in each class.

The tendency here shown for a limited number of large cities is confirmed by the figures for the United States.

In 1890 the total number of daily newspapers was 1,610, of which 559 were published in the morning and 1,051 in the evening; in 1900 there were 595 morning papers, an increase of 6.4 per cent, and 1,631 evening papers, an increase of 55.2 per cent. This difference appears more striking when it is recalled that the increase, during the decade, in all daily publications was 38.3 per cent. In 1890 the proportion of evening dailies to morning dailies was about 2 to 1; in 1900 about 3 to 1.

Intelligent consideration of the figures, for the cities treated in Tables 29 and 30, drawn from a comparison of aggregate circulation per issue with population, presupposes knowledge of their limitations. The figures thus secured, while interesting in themselves, possess no especial statistical value, because they are seriously affected by local conditions. It will be observed that the "rank of cities according to number of inhabitants to each copy per issue" bears no relation to the rank of these cities in population. What the aggregate circulation within a city really is, has never been ascertained. Were these statistics obtainable, it would doubtless appear that a fairly constant ratio exists between aggregate circulation and number of inhabitants.

According to figures presented in Tables 29 and 30, the rank of a city depends upon its ability to market, outside of its own limits, its newspaper and periodical products. The most important factors affecting rank as here recorded are the existence of a large adjacent community; of very populous and extended suburbs; and of a large tributary section. Of the first class, New York is the most conspicuous example: Brooklyn, which, although a part of New York city, is given separately in Table 30 for purposes of comparison, depends almost exclusively upon New York for newspaper and periodical service; Jersey City and Hoboken, N. J., are equally dependent; while Newark and Paterson, N. J., both within a radius of 20 miles, rely upon New York, to a great extent, for newspapers and periodicals. In this class, also, should be mentioned Allegheny, Pa., an independent municipality, but virtually a part of Pittsburg. Of the second class, Philadelphia, Pa., and Cincinnati, Ohio, are examples. Boston, Mass., is an example of the third class; the publications of that city not only fulfill most of the requirements of the many near-by cities, but circulate freely throughout all parts of New England.

The effect of these local conditions is twofold—the rank of the larger city is advanced, and that of the adjacent smaller city is reduced.

TABLE 32.—*Comparison of the number of inhabitants to each copy per issue in certain large cities, with that of adjacent smaller cities, 1900*

LARGE CITIES.	Rank.	Number of inhabitants to each copy per issue.	ADJACENT SMALLER CITIES.	Rank.	Number of inhabitants to each copy per issue.
New York (Manhattan and Bronx boroughs)	[1]5	0.78	Brooklyn	[1]25	12.22
			Newark	40	3.43
			Jersey City	43	10.54
			Paterson	41	4.55
Philadelphia	10	1.28	Camden		4.69
Boston	3	0.74	Fall River	42	5.56
			Cambridge	44	45.94
San Francisco	6	1.13	Oakland		4.03
Cincinnati	1	0.63	Covington		13.42
Pittsburg	4	0.76	Allegheny		(2)
Kansas City, Mo	2	0.72	Kansas City, Kans.		22.35

[1] As shown in Table 30. [2] No daily papers.

Table 32 shows that in 1900 Cambridge, Mass., was a conspicuous example of dependence upon a larger city for newspapers and periodicals. Cambridge is practically a part of Boston. While it is a community noted for intelligence and cultivation, and the seat of a famous university, it has patronized the publications of its larger neighbor, thus elevating the rank of the latter and establishing an apparently low record for itself.

Business managers of daily newspapers in the larger cities have been prompt to take advantage of the constantly improving mail service, and of the increased ease and speed of railway communication. The improvements along these lines during the past twenty years are reflected in the changes shown by Table 29. In 1880 no city reported a circulation as great as the number of its inhabitants. The five cities having the smallest number of inhabitants to a copy per issue were—

Pittsburg	1.41
New York	1.58
San Francisco	1.63
Boston	1.64
St. Paul	2.08

The figures here given for Pittsburg would have entitled it to eleventh place in 1900. In 1880 there were but 4 cities with less than 2 inhabitants to a copy; in 1890 there were 15 cities with less than 2, and 2 cities with less than 1; but the city which ranked first in that year would have been fifth in 1900, when 19 cities had less than 2 inhabitants to a copy, and 4 cities had less than 1. It is likely that the figures for 1880 approximately reflect local demand, while those for 1900 reflect systematic and elaborate extension.

CIRCULATION.

In Table 33 are presented, for each state and territory, the population, circulation, and number of inhabitants to each copy per issue, in 1900.

TABLE 33.—*Aggregate circulation and number of inhabitants to each copy per issue, by states and territories, 1900.*

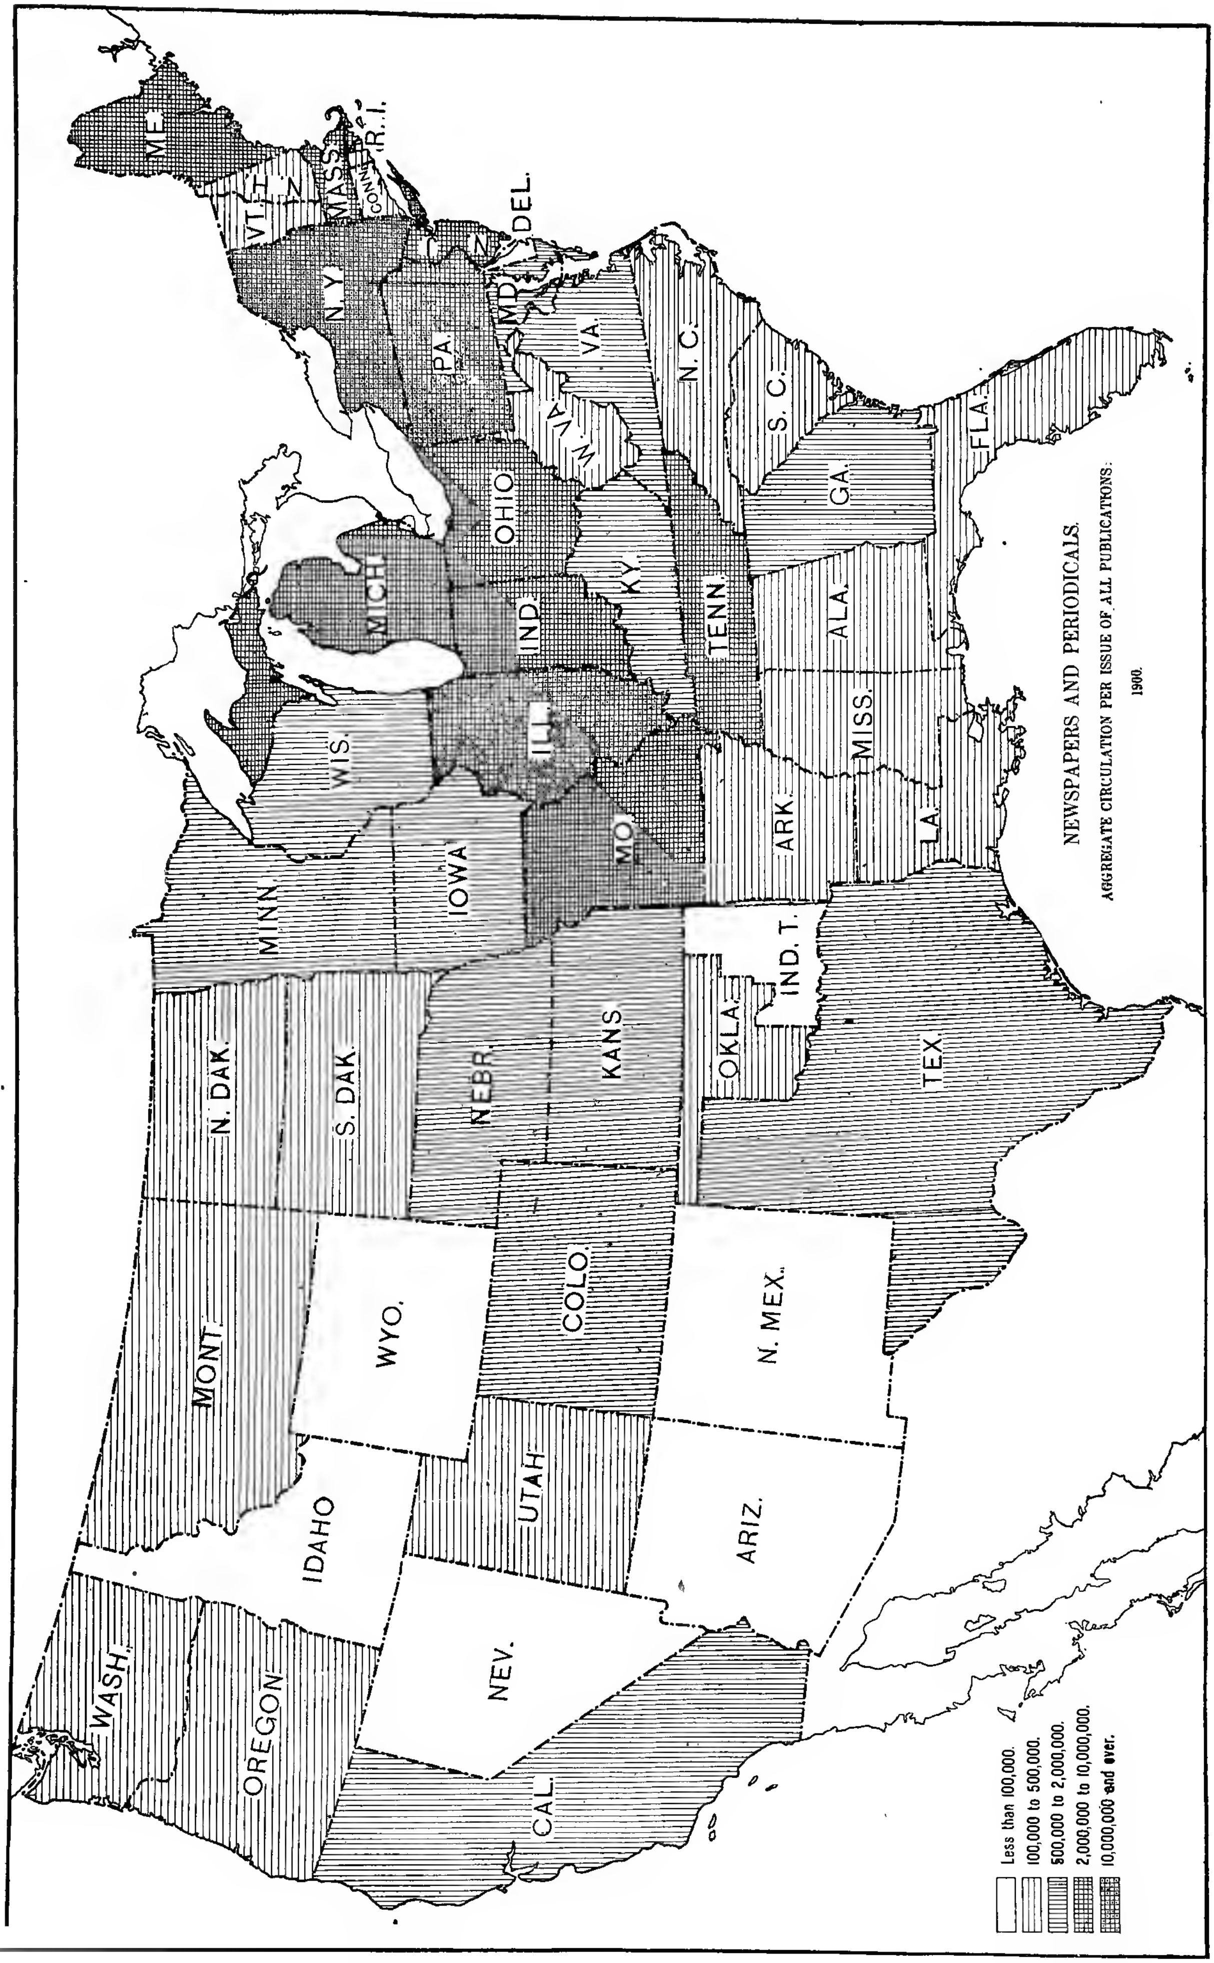
Washington	518,103	307,128	1.69
West Virginia	958,800	226,013	4.24
Wisconsin	2,069,042	1,426,499	1.45
Wyoming	92,531	32,687	2.83

The conditions described in connection with Tables 29 and 30, as to "number of inhabitants to each copy per issue," apply also to this table. The large cities showing heavy circulation in Tables 29 and 30 are important publishing centers, distributing their products far beyond city and state boundaries. This improves the relative standing of the states which produce, as compared with those which consume. The most notable example is New York, which may be termed the national producing center for leading publications of nearly all classes, as it distributes periodical literature over the entire United States, recording the enormous total of 37,626,095 aggregate circulation per issue of all classes, or more than three times the product of any other state. Another example is Maine, which records the noteworthy aggregate circulation per issue of all classes of 6,434,065 copies, the number of inhabitants to each copy per issue being a fraction so small that in this particular Maine heads the list of states. It is clear that the market for the products of these centers of commercial activity is a national one. The relation, therefore, of population to aggregate circulation might almost be termed fortuitous. On the other hand, it must not be overlooked that the states which are large exporters are likely to be also large importers of periodical literature.



NEWSPAPERS AND PERIODICALS.
AGGREGATE CIRCULATION PER ISSUE OF ALL PUBLICATIONS: 1900.

The aggregate circulation per issue attained by the periodicals of each state, when considered as representing the extent to which the enterprise of citizens markets the product of an industry at home and abroad, possesses much significance. This feature of Table 33 is considered in detail in connection with Tables 34 and 35.

Table 34 presents a comparative summary of the main facts relating to the industry, by states and territories, 1880 to 1900. Table 35 presents a comparative summary of average and aggregate circulation per issue, classified according to period of issue, by states and territories, 1880 to 1900.

TABLE 34.—COMPARATIVE SUMMARY OF NEWSPAPERS AND PERIODICALS, BY STATES AND TERRITORIES, 1880 TO 1900.

[1] Publications which were in existence, but from which no returns were received.
[2] Obtained, for each class of publications, by multiplying the aggregate circulation per issue by the number of issues during the year.
[3] Includes the employees engaged in the book and job printing branch of the industry, and their wages.
[4] For purposes of comparison the figures for "book and job printing" and "all other products" are excluded.
[5] In 1880 Indian Territory and Oklahoma were reported as Indian Territory, and North Dakota and South Dakota as Dakota; the 1880 figures are included only in the totals.
[6] Includes 1,182 publications not reporting operations, as they can not be excluded from the classification.

TABLE 34.—COMPARATIVE SUMMARY OF NEWSPAPERS AND PERIODICALS BY STATES AND TERRITORIES, 1880 TO 1900—Continued.

STATES AND TERRITORIES.	Year.	NUMBER OF PUBLICATIONS. Total.	Reporting.	Not reporting.[1]	Aggregate circulation per issue.	Aggregate number of copies issued during the census year.	WAGE-EARNERS. Average number.	Total wages.	Pounds of paper used.	VALUE OF NEWSPAPER PRODUCTS. Total.	Advertising.	Subscriptions and sales.

[3] Indian Territory and Oklahoma were reported as Indian Territory in 1880. Average circulation, all classes, 2,030; weekly, 2,030. Aggregate circulation, all classes, 4,060; weekly, 4,060.

[4] Includes 1 semiannual.

Consideration of Tables 33, 34, and 35 permits a significant grouping of facts relating to aggregate circulation and to the circulation of daily, weekly, and monthly publications. Of a total of 114,299,334 aggregate circulation per issue for all newspapers and periodicals, 10 states—New York, Pennsylvania, Illinois, Ohio, Maine, Massachusetts, Missouri, Tennessee, New Jersey, and Michigan, ranking in the order given—supplied 79.5 per cent in 1880, 79.8 per cent in 1890, and 81.8 per cent in 1900. Of a total of 15,102,156 aggregate circulation per issue for all daily newspapers, 10 states—New York, Pennsylvania, Illinois, Ohio, Massachusetts, Missouri, California, Indiana, Michigan, and Minnesota, ranking in the foregoing order—supplied 78.1 per cent in 1880, 77.1 per cent in 1890, and 78.9 per cent in 1900. Of a total of 39,852,052 aggregate circulation per issue for all weekly newspapers and periodicals, 10 states—New York, Illinois, Pennsylvania, Ohio, Massachusetts, Missouri, Tennessee, Iowa, Minnesota, and Indiana, ranking in the order given—supplied 75.1 per cent in 1880, 71.9 per cent in 1890, and 76.6 per cent in 1900. Of a total of 39,519,897 aggregate circulation per issue of monthly newspapers and periodicals, 10 states—New York, Maine, Pennsylvania, Illinois, Massachusetts, Ohio, Missouri, Michigan, Indiana, and Minnesota, ranking in the order named—supplied 91 per cent in 1880, 87.4 per cent in 1890, and 92.5 per cent in 1900. These facts are shown in Tables 36, 37, 38, and 39.

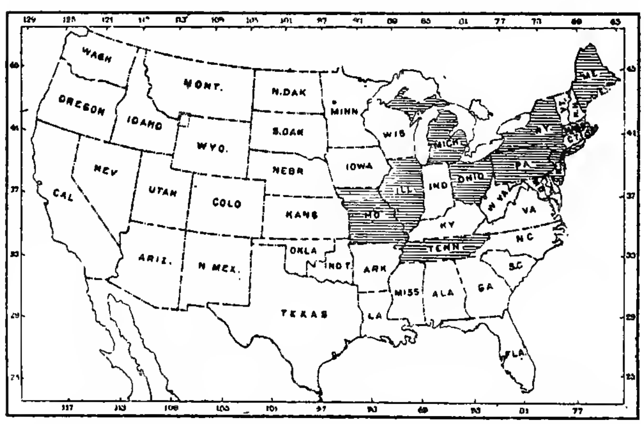
CARTOGRAM 1.—*Ten states possessing 81.8 per cent of aggregate circulation per issue of all publications, 1900.*



By reference to cartogram 1, the geographic relation of the preponderance exerted by the 10 leading states is clearly perceived. The 10 states which possess 81.8 per cent of the aggregate circulation of all publications form a belt beginning at the eastern border of Kansas, and extending—with a break at Indiana—through Massachusetts, Maine, New York, and New Jersey to the Atlantic Ocean. From this belt Michigan is an offshoot northward and Tennessee southward. The 10 states leading in circulation of dailies form almost the same belt, made more marked by the addition of Indiana; California and Minnesota, also, are added, and Maine, New Jersey, and Tennessee omitted. The 10 states possessing the largest weekly and monthly circulation per issue are similar in general location, showing a band which extends from the Kansas border to Maine—Maine and Minnesota being isolated in the monthly class.

The tabular statements relating to this subject show that the production of monthlies is centralized in a few states to a greater degree than that of any other class of periodicals, 10 states possessing 92.5 per cent of the aggregate circulation. The production of weekly periodicals is most decentralized, perhaps because the weekly is the publication of the average community, and as a class is less the particular product of any state, or group of states, than any other class of publications.

While the figures presented in the foregoing comparisons indicate clearly the great importance of a small number of states in the aggregate circulation per issue, as well as in the circulation per issue for different classes, the fact is important that in number of establishments, capital, and value of products this preponderance is not so clearly maintained. The states already shown to possess more than four-fifths of the aggregate circulation of all newspapers and periodicals, reported but 45.4 per cent of all establishments, namely, 8,279 out of a total of 18,226. Moreover, these states showed a steady and considerable decrease in the proportionate number of establishments, having 54.2 per cent of the total in 1880, 50.7 per cent in 1890, and 45.4 per cent in 1900. They were not the 10 states having the largest numbers of establishments. The 10 states having the largest number of establishments reported but 60.4 per cent of the whole number in the United States in 1880, 59.2 per cent in 1890, and 56.8 per cent in 1900. Thus the relation which the number of establishments in the states selected bore to the whole number in 1880, 1890, and 1900 was also a declining one. It is clear, therefore, that in the last two decades the number of establishments has increased more rapidly in some states with a comparatively small number of establishments than in those possessing the largest number. In the latter class of states there appears to have been an actual decrease in number of establishments, though, as previously shown, not in actual circulation—an evidence, possibly, of consolidation.

Of the total capital, the 10 states possessing the largest circulation per issue of all publications, reported 65.6 per cent in 1890 and 68.9 per cent in 1900. Of the total value of products, they reported 69.8 per cent in 1880, 69.6 per cent in 1890, and 71.1 per cent in 1900.

THE RELATION OF CIRCULATION TO POPULATION.

It has been pointed out, in connection with Tables 29, 30, and 33, that the circulation of newspapers and periodicals reported by each state and by each large city, is in reality a product not governed by local consumption, but intended for distribution regardless of state lines, distances being limited only by the ability and energy of the producers in securing patronage. While the circulation reported by each state is of great importance as representing a product, it is difficult to dissociate this product from the state's own requirement, and to remember that of the total circulation reported, the state itself may use but a fraction. In some respects the number of publications forms a more reliable basis of comparison than circulation—the latter being often so exceptional as to make the standing of the state or territory appear very different from what it really is. In Table 40 the number of publications has been used as a basis, except in the last two columns, which are inserted because they furnish several interesting conclusions.

TABLE 40.—*Number of publications to each 1,000 inhabitants, by states, per cent that number of publications in each state forms of total number, and per cent of increase in aggregate circulation per issue, 1890 and 1900.*

[1] Decrease.
[2] See note 6, page 25
[3] See note 2, page 26.

All but 16 states and territories showed an increase, during the past decade, in the number of publications to each 1,000 inhabitants, but in the majority of cases the increase was slight.

The number of publications to each 1,000 inhabitants was greatest in Nevada, where there was a marked decline in population—showing that the decreasing communities in that state retained local publications already in existence.

The states and territories showing, in 1900, an increase of more than 100 per cent in aggregate circulation per issue, were Colorado, the District of Columbia, Idaho, Indian Territory, Maine, Missouri, New Jersey, New York, Oklahoma, and Tennessee. Of these, Colorado, Idaho, Indian Territory, and Oklahoma doubtless owed their increase to the influx of population during the decade, and Maine and New Jersey to special publications producing a condition which is to some extent misleading for comparative purposes. The decline in the per cent of increase in aggregate circulation per issue, as compared with that shown in 1890, is very marked, appearing in no less than 39 states and territories. Upon this fact, however, the greater accuracy of enumeration in 1890, as compared with 1880, has an important bearing.

Table 41 presents the figures for the 16 states and territories showing a decrease in the number of publications to each 1,000 inhabitants.

TABLE 41.—*Comparison of increase in aggregate circulation per issue with increase in population, for the 16 states and territories showing decrease in number of publications per 1,000 inhabitants, 1900.*

STATES AND TERRITORIES.	Per cent of increase in aggregate circulation per issue.	Per cent of increase in population.
Arizona	52.6	68.0
Connecticut	[1]7.8	21.7
Delaware	54.5	9.6
Florida	4.7	35.0
Georgia	[1]25.1	20.6
Kansas	90.9	2.9
Massachusetts	33.0	25.3
Montana	84.3	75.2
New Hampshire	[1]18.9	9.3
New Jersey	102.4	30.4
New York	108.7	21.1
North Dakota	60.7	70.9
Oklahoma	719.4	518.2
Pennsylvania	19.1	19.9
Rhode Island	14.6	24.0
Washington	50.2	46.5

[1] Decrease.

It appears that in 8 of these 16 states and territories in which the number of publications per 1,000 inhabitants decreased, the circulation of existing publications nevertheless increased more rapidly than the population. These were Delaware, Kansas, Massachusetts, Montana, New Jersey, New York, Oklahoma, and Washington. This fact indicates clearly an extension of the circulation of existing publications, rather than the establishment of new ones. This tendency is not confined to the 7 states and the territory mentioned, but is characteristic of many of the states, especially the older ones.

Table 42 shows the total number of publications classified according to period of issue and character, by states and territories, from 1880 to 1900.

[4] In 1880 "trade journals" were included with "commerce, finance, insurance, and railroads," "Sunday newspapers" with "miscellaneous," and "college and school periodicals" with "education and history."

[5] Includes 217 children's publications and Sunday school papers.

[6] Indian Territory and Oklahoma reported as Indian Territory in 1880.

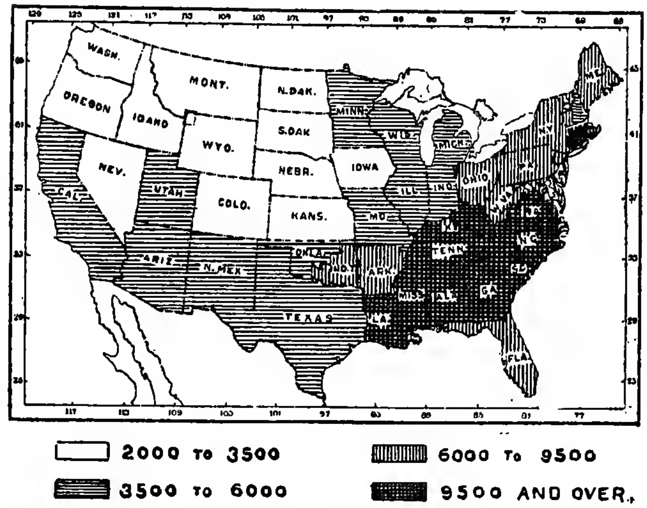
Michigan	34,585	Tennessee	126,288
District of Columbia	34,840	South Carolina	191,474

From the rearrangement of states and territories given in Tables 44 and 45, it will be observed that in 1900 the proportion of inhabitants to each weekly publication was far more uniform than that to each daily. The range of number of inhabitants to each weekly publication is shown to be between 2,016, for Nevada, and 20,407, for Rhode Island.

On dividing the entire list of states and territories, arranged by rank according to the number of inhabitants to each weekly publication, into four groups, it appears that the first group is composed of the states and territories having from 2,000 to 3,500 inhabitants to each weekly publication; the second, from 3,500 to 6,000; the third, from 6,000 to 9,500; and the fourth, from 9,500 upward. The geographic relations of the states and territories composing these groups are clearly illustrated in cartogram 2, in which the United States is divided into irregular but practically contiguous sections. The smallest numbers of inhabitants to each weekly publication are shown in the middle West and Northwest. The next class forms an irregular section beginning with California, and extending, with practically no break, through Texas, Oklahoma, and Missouri to Lake Michigan and Minnesota. It is clear that the inhabitants of the states shown in this class depend less

CARTOGRAM 2.—*Number of inhabitants to each weekly publication, by states and territories, 1900.*



upon weekly publications than do those of the preceding class. The third class appears principally in the group of populous states beginning with Ohio and extending northeast to Maine. The fourth class is composed of Massachusetts, Rhode Island, Connecticut, Kentucky, Tennessee, and all the Southern states except Florida.

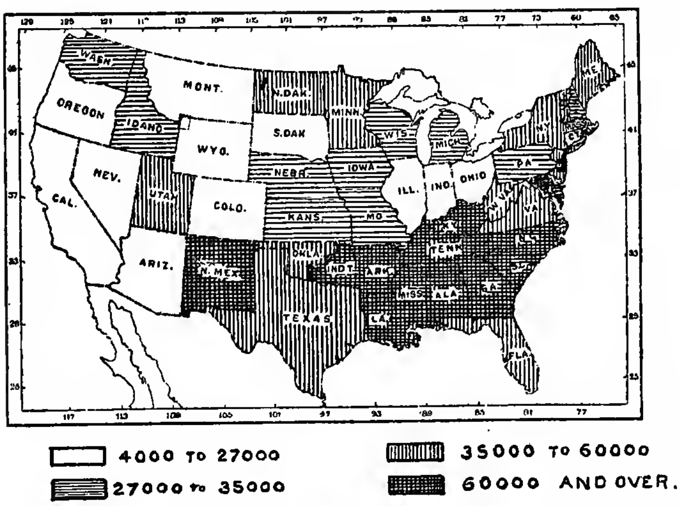
It is evident that the high ratio of inhabitants to weekly periodicals indicates either a low percentage of publications, in general, to number of inhabitants, or else the substitution, for weekly newspapers, of publications issued more frequently. In the case of the three New England states above mentioned it appears, by reference, in the comparative table, to the column relating to the number of inhabitants to each daily publication, that Massachusetts and Connecticut are shown in the two classes having the largest proportion of daily publications to inhabitants. In the case of Rhode Island, 81.2 per cent of the population resides in cities of over 8,000 inhabitants. Considering this exceptional rate and the small area, there is little probability of success in the publication of weekly newspapers in Rhode Island. The proportion of dailies to population is higher than that of weeklies, but proximity to New York and to the large cities of Massachusetts and Connecticut, has led to considerable dependence on those centers for daily newspapers, thus producing a comparatively low rank for dailies also.

By referring to page 68 it will be observed that the sections which are the most liberal patrons of the "patent insides" method of publishing weekly newspapers are the Eastern and Western North Central groups of states. Of the "patent insides" used in the United States, over 60 per cent were sent to these states. It will be noted by cartogram 2 that this section is the chief stronghold of the weekly.

When the number of inhabitants to each daily newspaper is made the basis of classification, the proportion varies from 4,704, for Nevada, to 191,474, for South Carolina. In the populous states the proportion of population to each daily publication varies from 20,000 to 40,000. On dividing the states and territories, as in the case of weekly publications, into 4 groups or classes, it appears that the proportion of population to each daily newspaper ranges, in the first class, from 4,000 to 27,000; in the second, from 27,000 to 35,000; in the third, from 35,000 to 60,000; and in the fourth, from 60,000 upward.

The conditions which surround the publication of daily newspapers are so complex—depending largely upon locality, character of the population, ambition of the community, proximity to large cities, and especially upon ability to be an active producer of circulation rather than a receiver of it from elsewhere—that it is not surprising to find that the comparison is less significant than that for weeklies. The proportions of inhabitants to daily publications are shown geographically in cartogram 3.

Cartogram 3.—*Number of inhabitants to each daily publication, by states and territories, 1900.*



In general, the far Western states, which showed high averages in the proportion of population to weekly publications, showed a similar proportion for daily publications. Obviously, this is due to the ambition and energy of isolated communities, which by reason of distance must produce their own daily publication or go without one.

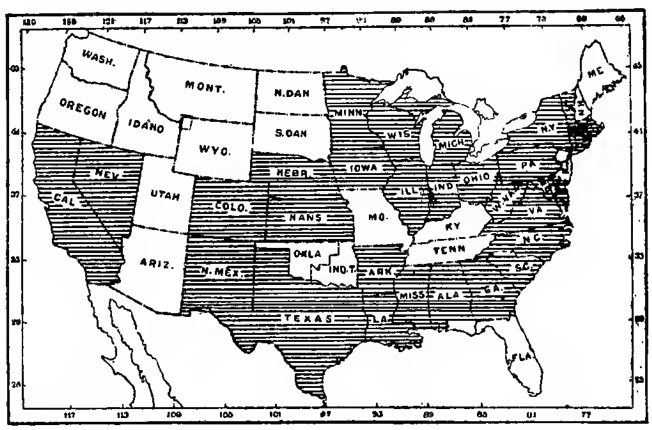
The region in which, with respect to population, both daily and weekly papers are least numerous, is in general the group of states east of the Mississippi and south of the Ohio and Potomac, where there is less than 1 daily to every 60,000 people, and less than 1 weekly to every 9,500. The region in which they are most numerous is in general the states of the Western division, in most of which there is more than 1 daily to every 35,000 people, and more than 1 weekly to every 3,500. In other words, publications of this character are most numerous in the western and northwestern parts of the country, and least numerous in the southeastern part.

The fact that the New England states with largest population are in the highest or next to the highest class in number of inhabitants to each daily newspaper, but rank low in number of inhabitants to each weekly publication suggests that in that densely peopled region, with highly developed facilities for rapid distribution to a numerous public, the daily has in some measure supplanted the weekly.

During the last decade the number of inhabitants to each weekly publication increased in 26 out of 49 states and territories, from which fact it appears that in more than half the states and territories the increase in the number of weekly publications failed to keep pace with the increase in population.

In the case of the daily newspaper the changes wrought during the decade from 1890 to 1900 are more striking. Out of 49 states and territories it appears that in 31 the proportion of inhabitants to each daily publication decreased, while in the other 18 the increase in number of publications failed to keep pace with the increase in population. The marked advance of the daily in proportion to population, shown in a majority of the states, is represented in cartogram 4.

Cartogram 4.—*States ana territories in which there was a gain in number of daily newspapers in proportion to population.*



It will be observed that those states and territories which showed a gain in the number of inhabitants to each daily newspaper were, for the most part, those containing large cities, which acted as purveyors of news to adjacent states or territories. Massachusetts, for example, supplied portions of New England; New York and Pennsylvania supplied New Jersey; Ohio supplied Kentucky; the large cities of Minnesota formed centers of distribution for North Dakota and South Dakota; and on the Pacific coast California was the center for publications of the daily class. All the states bordering upon the Great Lakes, and 15 out of 21 seaboard states, showed an increase in the proportionate number of daily newspapers to inhabitants. In this group are found all but 9 of the states and territories showing an increase in the number of daily publications to inhabitants. In general, the states in which the daily lost ground during the decade ending in 1900 were those in the far Northwest, and in that section were recorded the most marked gains made by the weekly.

DISTRIBUTION, BY GEOGRAPHIC DIVISIONS, OF CIRCULATION, NUMBER OF ESTABLISHMENTS, CAPITAL, AND VALUE OF PRODUCTS.

The consideration of the geographic distribution of circulation, number of establishments, capital, and value of products which follows, employs the following grouping of the states and territories by minor geographic divisions:

NORTH ATLANTIC DIVISION.

New England.—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut.

Southern North Atlantic.—New York, New Jersey, Pennsylvania.

SOUTH ATLANTIC DIVISION.

Northern South Atlantic.—Delaware, Maryland, District of Columbia, Virginia, West Virginia.

Southern South Atlantic.—North Carolina, South Carolina, Georgia, Florida.

NORTH CENTRAL DIVISION.

Eastern North Central.—Ohio, Indiana Illinois, Michigan, Wisconsin.

Western North Central.—Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, Kansas.

SOUTH CENTRAL DIVISION.

Eastern South Central.—Kentucky, Tennessee, Alabama, Mississippi.

Western South Central.—Louisiana, Arkansas, Indian Territory, Oklahoma, Texas.

WESTERN DIVISION.

Rocky Mountain.—Montana, Idaho, Wyoming, Colorado, New Mexico.

Basin and Plateau.—Arizona, Utah, Nevada.

Pacific.—Washington, Oregon, California.

Circulation.—The preponderance of certain states in circulation, before noted, is again indicated upon examining aggregate circulation by geographic divisions.

TABLE 46.—*Aggregate circulation per issue of all classes of publications, by main geographic divisions, with per cent which circulation in each division forms of total, 1890 and 1900.*

DIVISION.	AGGREGATE CIRCULATION FOR ALL CLASSES.		PER CENT OF TOTAL.		Per cent of increase, 1890 to 1900.
	1900	1890	1900	1890	
United States	114,299,334	69,138,934	100.0	100.0	65.3
North Atlantic	65,577,439	37,208,013	57.4	53.9	76.2
South Atlantic	3,551,594	2,385,414	3.1	3.5	48.9
North Central	35,747,654	23,742,919	31.3	34.3	50.6
South Central	6,417,164	3,765,571	5.6	5.4	70.4
Western	3,005,483	2,037,017	2.6	2.9	47.5

The North Atlantic and North Central divisions combined possessed 88.2 per cent of the aggregate circulation per issue in 1890, and 88.7 per cent in 1900. The North Atlantic division advanced 3.5 per cent, while the North Central declined 3 per cent, during the decade.

In Table 47 the circulation per issue of all classes, and of dailies, weeklies, and monthlies, in 1890 and 1900, with the per cent of increase, is shown by minor geographic divisions, together with the per cent of the total circulation for the United States, in 1890 and in 1900, reported for each division.

TABLE 47.—*Aggregate circulation per issue of all classes, by minor geographic divisions, with per cent which circulation for each division forms of total, 1890 and 1900.*

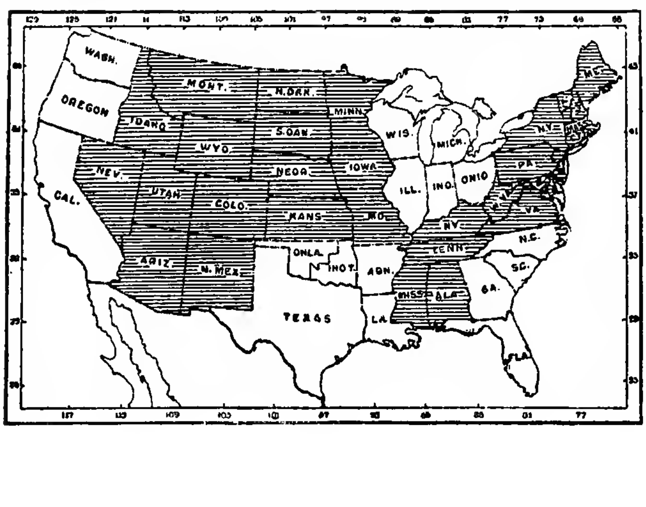
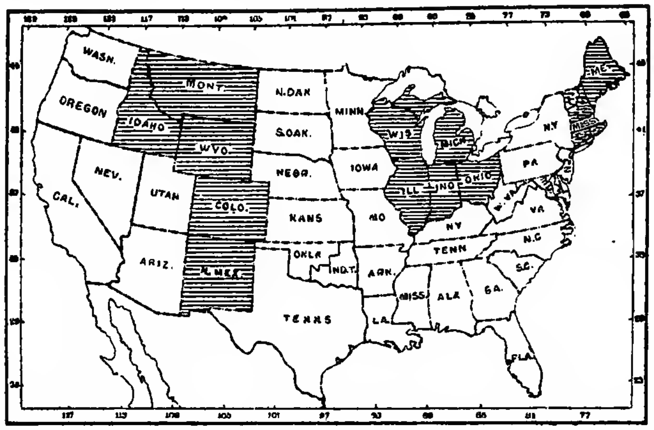
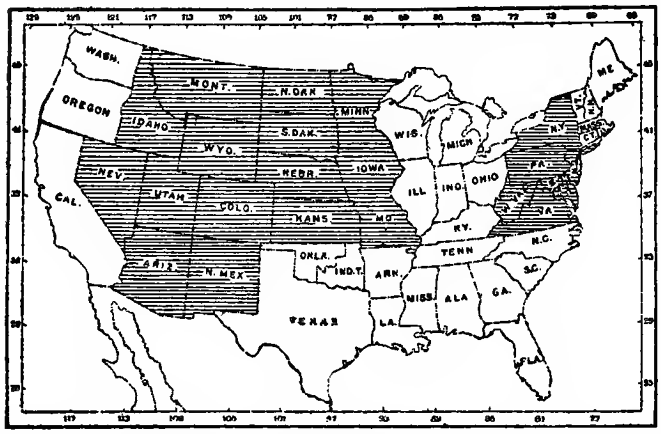
Cartogram 5.—*Minor geographic divisions in which the rate of increase in circulation per issue of all classes was more rapid than the rate of increase for the United States, 1900.*



Cartogram 6.—*Minor geographic divisions in which the rate of increase in circulation per issue of dailies was more rapid than the rate of increase for the United States, 1900.*



Cartogram 7.—*Minor geographic divisions in which the rate of increase in circulation per issue of weeklies was more rapid than the rate of increase for the United States, 1900.*



Cartogram 8.—*Minor geographic divisions in which the rate of increase in circulation per issue of monthlies was more rapid than the rate of increase for the United States, 1900.*

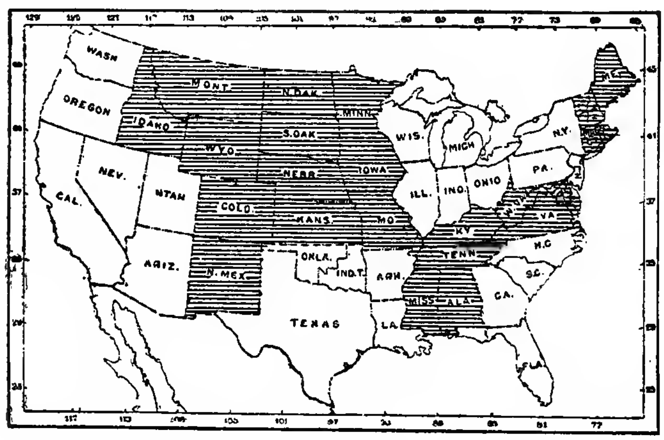


Table 47, in connection with cartograms 5, 6, 7, and 8, shows that in circulation of all classes there was a large increase in each division except the Southern South Atlantic. The most striking advance in the proportion of the total circulation reported was in the Southern North Atlantic group—New York, Pennsylvania, and New Jersey. The Western North Central group—Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas—also showed a decided advance. In daily circulation all divisions showed a large increase, though but three showed a greater proportion of the total circulation of daily newspapers for the United States than in 1890; of these the New England states and the Eastern North Central group—Ohio, Indiana, Illinois, Michigan, and Wisconsin—showed the most decided advance. In the circulation of weekly newspapers and periodicals the Southern South Atlantic group showed a slight decrease, while the remaining groups all showed a moderate increase. The most striking advance in the proportion of the total circulation of weekly publications reported was in the Southern North Atlantic group. In monthly circulation a decrease was shown in the Southern South Atlantic and Western South Central groups. In the other divisions a large increase was shown. The greatest advance in the proportion of the total circulation of monthly publications reported was shown for New England and the Western North Central group.

In Table 48 is presented a comparison of the aggregate number of copies issued during the census years 1890 and 1900, by main geographic divisions, with the per cent which the number of copies for each division forms of the total. The proportions in 1900 agree substantially with those for the circulation per issue of all publications for the same geographic divisions, the greatest difference being 6.6 per cent in the North Atlantic division.

TABLE 48.—*Aggregate number of copies issued during the census year, by main geographic divisions, with per cent which number for each division forms of total, 1890 and 1900.*

DIVISION.	AGGREGATE NUMBER OF COPIES ISSUED DURING THE CENSUS YEAR.		PER CENT WHICH NUMBER OF COPIES FOR EACH DIVISION FORMS OF TOTAL.		Per cent of increase, 1890 to 1900.
	1900	1890	1900	1890	
United States	8,168,148,749	4,681,113,530	100.0	100.0	74.5
North Atlantic	4,150,978,811	2,305,659,459	50.8	49.3	80.0
South Atlantic	361,278,033	221,901,227	4.4	4.7	62.8
North Central	2,810,281,262	1,604,549,714	34.4	34.3	75.1
South Central	449,933,789	281,679,126	5.5	6.0	59.7
Western	395,676,854	267,333,004	4.9	5.7	48.0

Table 49 is of interest principally as showing the relation between the distribution of aggregate circulation per issue and that of the aggregate number of copies issued during the census year.

TABLE 49.—CIRCULATION OF NEWSPAPERS AND PERIODICALS CLASSIFIED

Number of establishments.—It has already appeared that the circulation of newspapers and periodicals is largely centralized in certain states. Table 50 indicates that if the industry be measured by number of establishments, rather than by output, no such centralization exists.

TABLE 50.—*Number of establishments, by minor geographic divisions, with per cent which number in each forms of total, 1890 and 1900.*

DIVISION.	NUMBER OF ESTABLISHMENTS.		PER CENT WHICH NUMBER IN EACH DIVISION FORMS OF TOTAL.		Per cent of increase, 1890 to 1900.
	1900	1890	1900	1890	
United States	15,305	12,362	100.0	100.0	23.8
New England	800	815	5.2	6.6	[1]1.8
Southern North Atlantic	2,509	2,479	16.4	20.1	1.2

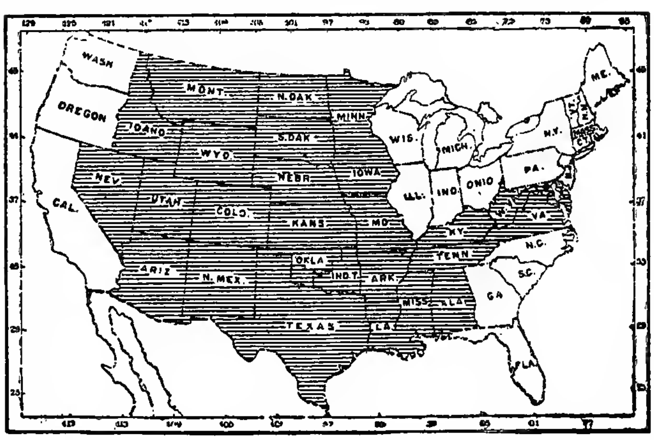
Western North Central	3,700	2,846	24.2	23.0	30.0
Eastern South Central	786	597	5.1	4.8	31.7
Western South Central	1,161	674	7.6	5.5	72.3
Rocky Mountain	429	281	2.8	2.3	52.7
Basin and Plateau	123	53	0.8	0.4	132.1
Pacific	859	848	5.6	6.9	1.3

[1] Decrease.

From Table 50 it appears that of the total number of establishments in 1900, New England—already shown to be an important factor in the publishing industry—possessed only 5.2 per cent, and that the Southern North Atlantic states—a group immensely influential in the production of periodicals—showed only 16.4 per cent. Thus, these two groups combined represented but 21.6 per cent of the total number of establishments. The changes in relative importance from 1890 to 1900 were not marked; 5 divisions showed declines, and in but 2 was the advance sufficiently great to be worthy of notice. Cartogram 9 presents those

CARTOGRAM 9.—*Minor geographic divisions in which the rate of increase in the number of establishments was greater than the rate of increase for the United States, 1900.*



minor geographic divisions showing a per cent of increase in number of establishments exceeding the per cent of increase for the United States. From this cartogram it appears that in all of the states bordering on the Atlantic and Pacific oceans, except Delaware, Maryland, and Virginia, and in all of the states bordering on the Great Lakes, except Minnesota, the per cent of increase in number of establishments is less than that for the United States. The states showing these relatively low percentages of increase contain most of the large cities, and are the ones in which consolidation of establishments is most likely to occur.

Capital.—The distribution of capital by minor geographic divisions is shown, in Table 51 and by reference to cartogram 10, to vary in a marked degree from the distribution of the number of establishments.

TABLE 51.—*Capital, by minor geographic divisions, with per cent which capital in each forms of total, 1890 and 1900.*

DIVISION.	CAPITAL.		PER CENT WHICH CAPITAL IN EACH DIVISION FORMS OF TOTAL CAPITAL.		Per cent of increase, 1890 to 1900.
	1900	1890	1900	1890	
United States	$192,443,708	$126,269,885	100.0	100.0	52.4

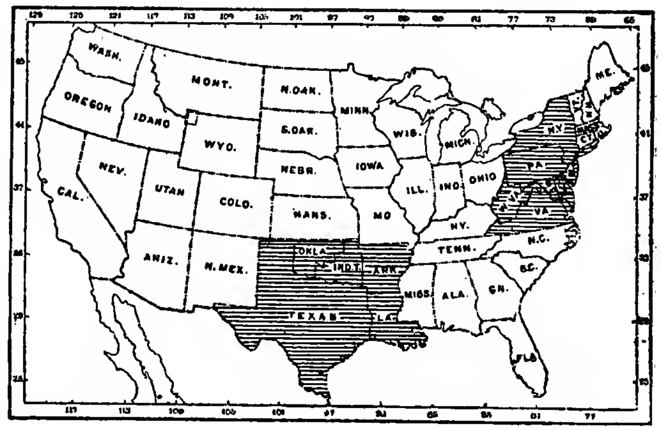
In 8 out of the 11 divisions the per cent which the capital invested formed of the total capital was less in

CARTOGRAM 10.—*Minor geographic divisions in which the rate of increase in capital was more rapid than the rate of increase for the United States, 1900.*



1900 than in 1890. The only marked advance was made in the Southern North Atlantic group—New York, Pennsylvania, and New Jersey—which increased its lead at the expense of nearly all of the other divisions. In other words, during the decade just ended, the centralization of this industry, as measured by capital invested therein, has made most rapid progress in the Southern North Atlantic group, and this in spite of the fact that in each division the absolute increase in capital was large. The very high per cent of increase for the United States was of course due, to some extent, to the enormous advance shown in the group mentioned. The per cent of increase for the remainder of the United States was only 39.3 per cent.

Value of newspaper and periodical products.—In Table 52 is presented, by geographic divisions the combined value of advertising, and subscriptions and sales. These figures show greater uniformity in relative importance than any other figures for this industry. The advance is greatest in New England, and there it is but 1.5 per cent; in 3 divisions it is fractional; 1 presents the same proportion as in 1890; and 6 show declines, all of which are insignificant. In every division except the Southern South Atlantic there was an increase in the value of such products.

TABLE 52.—*Value of products, by minor geographic divisions, with per cent which value of products for each forms of total, 1890 and 1900.*

DIVISION.	VALUE OF PRODUCTS.		PER CENT WHICH VALUE OF PRODUCTS IN EACH DIVISION FORMS OF TOTAL.		Per cent of increase, 1890 to 1900.
	1900	1890	1900	1890

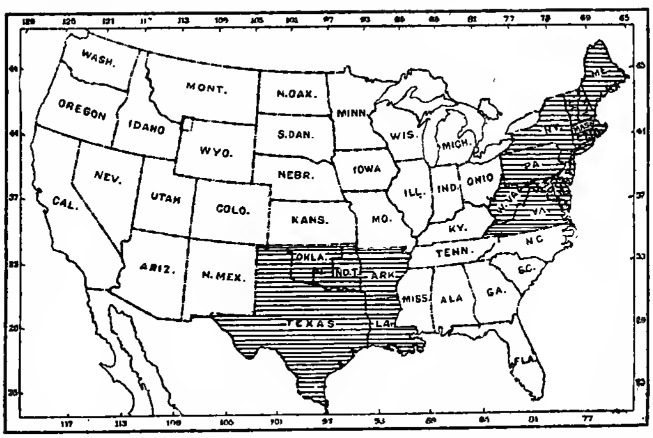
[1] Decrease.

CARTOGRAM 11.—*Minor geographic divisions in which the rate of increase in value of product was more rapid than the rate of increase for the United States, 1900.*



In cartogram 11 are indicated the minor geographic divisions showing a per cent of increase in value of products greater than the per cent for the United States.

It will be observed, from cartograms 9, 10, and 11, that the Western South Central group has exceeded the percentage for the United States in all three particulars—number of establishments, capital, and value of products—doubtless because of the influence of Texas.

Consideration of the proportions which each minor geographic division contributed to the totals for number of establishments, capital, and value of products, shows that 8 divisions ranked higher in number of establishments than in capital or value of products; that 1, the Southern North Atlantic, ranked highest in capital; and 1, New England, ranked highest in value of products. It is shown by Table 53 that the North Atlantic division, comprising New England, New York, New Jersey, and Pennsylvania, although having only 21.6 per cent of all establishments, possessed 52.2 per cent of all the capital, and produced 50.6 per cent of the total value of products; that 6 divisions possessed substantially the same proportion of each item, and that 3 possessed a decidedly greater proportion of the total number of establishments than of capital or value of products.

TABLE 53.—*Per cent of number of establishments, capital, and value of products in each minor geographic division, 1900.*

DIVISION.	Number of establishments.	Capital.	Value of products.
United States	100.0	100.0	100.0

Pacific	5.6	3.4	4.4

The detailed statistics for newspapers and periodicals are given in Table 58, which appears at the end of this report

BOOK AND JOB PRINTING.

Table 54 presents the number of establishments, capital, value of products, and wage statistics for this branch of the industry in 1890 and 1900, for cities containing 20,000 inhabitants and over.

TABLE 54.—SUMMARY OF BOOK AND JOB PRINTING FOR CITIES HAVING A POPULATION OF 20,000 OR OVER, 1900.

All other cities[1]		31	131,431	7	4,328	119	60,599	10,051	50,623	175,992

[1] Includes Bayonne, N. J., 2; Easton, Pa., 2; East St. Louis, Ill., 2; Everett, Mass., 1; Gloucester, Mass., 2; Joplin, Mo., 2; McKeesport, Pa., 2; Muskegon, Mich., 2; Newburg, N. Y., 2; Newport, Ky., 2; Norristown, Pa., 1; Orange, N. J., 2; Passaic, N. J., 1; Quincy, Mass., 2; Sheboygan, Wis., 1; South Omaha, Nebr., 1; Superior, Wis., 2; Taunton, Mass., 2.

In 1900, cities of 20,000 inhabitants and over contained 79.0 per cent of the separate job printing establishments of the country, with 95.8 per cent of the capital invested in such establishments, and 97.7 per cent of the value of products.

Table 55 compares the totals for cities of 20,000 and over with those for all other localities.

TABLE 55.—*Number of establishments, capital, and total and average value of products shown for cities of 20,000 or more inhabitants, and for other localities, 1890 and 1900.*

LOCALITY.	Year.	Number of establishments.	Capital.	Value of products.	Average value of products per establishment.
Cities of 20,000 or over	1900	5,466	$92,850,506	$118,943,242	$21,761
	1890	3,491	64,053,816	90,034,844	25,791
Other localities	1900	1,454	4,045,672	2,855,854	1,964
	1890	607	3,092,629	3,505,987	5,776

Between 1890 and 1900 the number of establishments in cities increased 56.6 per cent, but the value of products increased only 32.1 per cent, showing a decrease in the average value of products per establishment.

While the per cent of increase, between 1890 and 1900, in number of establishments outside of the cities was very large, in the value of products a decrease was shown, resulting in a much lower value of products per establishment in 1900 than in 1890. To some extent this change may be due to a more careful enumeration in 1900, by which were included certain small establishments that escaped notice in 1890.

Table 54 shows wide variations in number of establishments, capital, and value of products, in relation both to one another and to population. Large job printing establishments are often attracted to a given city by special causes quite distinct from population, as in the case of a state capital, in which a large amount of official printing is required. Of this class Albany, N. Y., Richmond, Va., and Hartford, Conn., are examples.

II. PROGRESS IN THE PRINTING AND PUBLISHING INDUSTRY.

When judged by modern ideas of progress, the art of printing was nearly stationary for four hundred years. Printing has been the most generous contributor to human progress, the handmaiden of all the arts and industries, and perhaps the most powerful factor in making the Nineteenth century the leader of all centuries in genius and invention; but it has been reserved for the last two decades to record the most substantial advances in the many and exacting details connected with the satisfactory production of a printed page. The invention of the 10-cylinder press, by Robert Hoe, in 1853, was declared by the lords of the privy council of England to be "one of the greatest steps ever made in printing." But in the far more difficult field of machine composition, inventors made no appreciable progress during the greater portion of the Nineteenth century; as late as 1880 the extended report of the Tenth Census upon this industry, after presenting evidence of the activity and progress of the period, declared: "While all these improvements have been following each other in the printing and delivery of newspapers, the ingenuity of man has not yet invented a substitute for the setting of type by hand, the method of composition remaining precisely the same as it was when printing was first invented."[1]

The first step toward the solution of this problem was taken in 1886, by Ottmar Mergenthaler, who invented the linotype machine, which shortly afterwards came into general use, and has been followed by several ingenious and successful inventions similar in purpose. Although only beginning to be felt, the effect of these inventions is already significant, and in them doubtless may be found the cause of many of the abrupt changes which are shown on contrasting the figures given for 1890 and 1900 in the tables for newspapers and periodicals. These remarkable inventions can not fail to affect more and more the future progress of the industry.

Types have no existence in the product of the linotype machine; the unit is the line, which is known as a "slug." By pressing keys the operator assembles brass matrices, and upon the completion of a line these are pressed forward against a bar of molten type metal, casting the line, or slug, in condition for printing. By continuation of this process the matrices return automatically to their receptacles.

Other inventors also attacked the problem of mechanical composition, and there have been placed upon the market the Lanston monotype, a combination of a keyboard by which a strip of paper is punched, and a machine casting individual types from matrices indicated by the passage of compressed air through the holes in the punched paper strip; the Goodson graphotype, also a combination of two machines, operated by electricity, and casting individual types; and the Scudder monoline, a Canadian machine somewhat like the linotype, except that the matrices are located upon a disk. The monoline machine has not been placed upon the American market.

Mechanical composition and distribution of foundry type are accomplished successfully by the Dow, Simplex, Empire, and other machines.

The question of wages has been somewhat affected by the introduction of these radical departures in composition. In 1850 a compositor in New York city received $1.50 per day, or $9 per week. Ordinary job compositors now receive $18, and operators upon machines receive considerably more. It is the opinion of many large employers of labor in this industry, that the invention of labor-saving machines has merely served to increase the demand for labor in new channels, so that the number of wage-earners employed has actually increased rather than diminished. The introduction of machine composition has been of decided benefit to the employee, offering a new field of employment at high wages. This fact is illustrated by the experience of the Typographical Union of New York city, in 1900, when called upon hastily to supply 150 men for a special piece of work in connection with city printing. Every effort was made to secure them, but in that great center of population and labor it was impossible to obtain, at short notice, more than 100 men fitted for the work.

[1]Tenth Census: The Newspaper and Periodical Press, by S. N. D. North, page 102.

During the decade type founding made marked progress in several of its branches. The Benton punch cutter and the Barth type-casting machine enabled the founder to dispense with much of the laborious and expensive detail connected with his calling, and to reduce materially the cost of type to the printer. To some extent the use of these machines offset the inroads which the use of machine composition made into the business of the type founder, and permitted him to increase greatly the output of special faces and artistic display type.

In the measurement of type bodies a revolution was effected. A uniform series of sizes, known as the "point system," was introduced about 1890, supplanting everywhere the earlier method, by which each foundry used a different size of "body." This radical change permitted the use of the type of one foundry with that of any other, and meant as much to the printer as the change from local to national currency meant to the nation.

In stereotyping, a device known as the autoplate was invented in 1900, by means of which the time required for casting plates was considerably reduced, and in electrotyping the value and efficiency of the foundry were enormously increased by the use of a strong current of electricity to hasten the deposit of copper, so that the time required by the process may now be controlled by the electrotyper to suit his customer.

The greatest advances in press building since 1880 have been made in perfecting presses. These machines are now constructed of such enormous size and with such great capacity that it is possible to obtain, at short notice, a newspaper press which will produce 100,000 impressions per hour, printed in 12 colors. The greatest advance in printing presses, however, was the construction of perfecting presses capable of producing the finest type and cut work as rapidly as though printing newspapers. Such machines, which were an impossibility in 1880, and an experiment in 1890, are now in general use, and are necessary to the production of the large number of inexpensive magazines and newspaper special supplements, profusely illustrated, which have become an important feature of current literature.

The great advance in the direction of printing in colors from plates, by means of which the printer has invaded the business of the lithographer, created a demand which the press maker met with a machine capable of printing the three primary colors and producing several more by combination at one impression, so that a complete picture in many colors may be the product of one impression.

In the field of illustration the decade has witnessed advances second only to the invention and commercial success of composing machines. The art of steel engraving, carried to great perfection about the middle of the century, has become practically a lost art, and by 1900 wood engraving was neglected and unprofitable, being replaced by the "line cut" and the "half tone."

These two classes of illustration are obtained by a combination of photography and etching. In producing the line cut the drawing is photographed and the negative printed upon a zinc plate. The lines of the photograph are then protected and acid is permitted to eat away the exposed portions, producing a relief. The mechanical details of the half tone resemble to some extent those of the line cut, but the process is much more delicate, and the element of individual skill plays a more important part. The relief upon the plate is secured by small dots obtained by photographing the drawing through two glass plates which have been closely ruled. The negative is then printed upon a copper plate, which is subsequently etched.

The effect of the extraordinary activity in invention and improvement, sketched above as characteristic of this great industry since 1880, has been twofold: To the printer himself it has been injurious rather than helpful; to the public it has been of incalculable advantage—a potent factor in elevating the standards of good taste.

It has already been pointed out that by the introduction of labor-saving devices in this industry, the wage-earner has doubtless benefited both in employment and in higher wages. As a matter of fact, the employing printer and not the wage-earner, suffered from new inventions and improvements in machinery. The type founder and the press maker secure protection from the ills of competition by consolidation, but no such relief is afforded to the printer. Indeed, from the nature of his calling, no effective combination could be organized. Extraordinary activity in mechanical invention and improvement, added to increasing competition, forced the printer to sacrifice to the interests of his business a large share of his narrow margin of profit. It is unlikely that there is any other industry in which there is so small a financial return for so much labor and uncertainty. Printers have seldom grown rich from their calling; their recompense has been generally in the character of their product. So far as wealth from his occupation is concerned, the printer of to-day, like his predecessor of centuries ago, lives entirely in the future.

Of far greater consequence, however, is the consideration of the quality of the product. There has been a remarkable advance, since 1880, in artistic composition and in artistic results in all classes of printing. The styles of printing employed during the last two or three decades may be divided into three general periods. The first period was that in which a great number of type faces were employed in all display work and title pages, apparently with the idea that several kinds of shaded and display type were necessary for effective presentation. This style of composition was accompanied by elaborate ornamentation, such as rule work, scroll work, impossible cranes, birds, frogs, and conventional designs. Such work was not artistic in any sense, and could be regarded as interesting and commendable only from the standpoint of ingenuity.

The second period was marked by the imitation of alleged ancient designs and type faces. In the Seventeenth century printing was placed under very great restrictions in England. In consequence of this, a large number of small printing shops sprang up in obscure places, being generally known as "holes." These shops often used secondhand and worn-out dresses of type, and, operating secretly, produced pamphlets and small books of a very poor grade. Where ornamentation or special letters were necessary, the printer himself cut them, generally in crude and barbarous fashion. Thus there was a distinct decline in the printing of that period, due to the product of this multitude of interdicted shops. Certain artists of the present day, coming across this class of work, endeavored to imitate what was not really a subject for imitation, for it did not represent the best work of the period. Advertisers seized upon these oddities with avidity, and for a time there was a considerable movement toward such extreme results; but this fashion appears to be already on the wane. It obtained little foothold on the title pages or in the ornamentation of standard books.[1]

The third period was one of better taste, the simplest types being used in the preparation of titles and display. At no period in the history of the industry has more beautiful work been produced in the combination of types and paper than during the decade which has just ended. Indeed, in the progress of this industry paper is a factor which should not be overlooked.

In 1862 the kind of news paper ordinarily used was made of cotton rags. It was imperfect, poor in color, and manufactured in the crudest manner. The price was 24 cents per pound. In 1900 stock of the same quality could not have been marketed for 2 cents per pound. The extensive use of wood pulp, and the great variety of qualities, weights, and surfaces made possible by increased skill and by improved paper-making machinery, are factors which must not be neglected in any careful survey of the advance of printing.

The volume of advertising circulars and pamphlet literature was never before so large or of such mechanical excellence as during the last decade. The educational effect upon the public at large of presenting in the most attractive and artistic form the ordinary details concerning commercial wares, can not be overestimated.

The underlying cause of this advance, however, is the fact that the untiring search for improvement

[1] Theodore L. DeVinne, to the writer.

has not been confined to the printing industry; other lines of commercial activity, scoring their triumphs, turned to the printer for exploitation by combinations of types, cuts, and paper so original and artistic as to compel attention and merit preservation. To this demand the printer was quick to respond. He became in many cases a designer, and firms were organized, with and without plants, to make a specialty of designing artistic combinations of types and material. This class of designing printers was practically a product of the last decade.

Leaping beyond the narrow limits of the modest and ugly circulars, leaflets, and handbills of two generations ago, the business community thus educated itself, through the activity of the period, to demand, for advertising purposes, the most beautiful products of the press.

In the realm of bookmaking no striking changes were recorded, but the advance in good taste and in artistic beauty of product was a marked characteristic of this branch of the industry. Fashions in bindings changed annually, but a widening range of materials and patterns, more daring use of designs and inks, and the invention and general use of automatic binding machinery supplemented improvements in printing, permitting lower prices for books and promoting phenomenal sales. It is a significant coincidence that the decade which witnessed extraordinary advance in all details of mechanical production in this industry, should be characterized also by the most noteworthy advance in the good taste and appreciation of the general public.

In connection with daily newspapers the beneficial results of the use of composing machines and of improvements in plate making, in presses, and in methods of illustration, are so obvious that they need not be discussed in detail. Many of the advances in mechanical construction, which already have been sketched, profoundly affected this class of publications.

The growth of the Sunday edition of the daily newspaper is worthy of notice. In 1900, 7 morning daily newspapers in New York published Sunday editions, aggregating nearly 400 pages. These enormous publications were composed of sections of 8, 12, or 16 pages devoted to news, literature, advertising, and comic illustrations in colors. The last-mentioned feature—made possible by the advance in color printing on perfecting presses—though carried to extremes, showed no sign of reaction.

There was no radical change in the gathering of news or in the management and scope of daily papers. One characteristic of the decade, however, was the great increase in the quantity of news published. Partly because of the ambitious and progressive spirit of the period, and partly because of the lavish expenditures of capital made by reorganized or newly established publications in order to break into the patronage of prosperous competitors and secure a foothold, the dailies of the great cities became the purveyors of the news of the world to an extent never before attempted. In many cases—especially in New York city, where the daily newspapers are of national repute—it was freely admitted that this expenditure was carried beyond the bounds of business prudence.

In 1886 the *New York World* reported the battle of Majuba Hill in six lines, but so rapid was the extension of news gathering that, fourteen years later, events in the same quarter of the globe were reported to the great American dailies by cable as fully as though close at hand. The destruction of St. Pierre, Martinique, in 1902, by an eruption of Mont Pelee, may be mentioned as an illustration of this tendency. Cablegrams concerning that great disaster reached American newspapers by way of Brazil, the Azores, and Great Britain, costing the recipients from $2 to $4 per word, with fees for precedence.

To some extent this outlay for increased news service has been met by organizing groups of newspapers in different cities to receive and publish duplicates of expensive cables or dispatches, but in few cases has this arrangement lifted more than half the burden. During the greater part of the decade the most stirring current events occurred on the other side of the globe; the war between China and Japan, the conquest of the Philippines, the war in South Africa, and the campaign of the Allies in the Far East required in turn costly presentation, while the operations of the Spanish War off Cuba, followed with wonderful efficiency by the American newspapers, involved immense expenditure. Many of the larger dailies maintained special yacht service between the scene of the conflict and Jamaica or Key West.

Upon the public the effect of such extensive news gathering was very marked; there was a decided increase in human interest; the world became a great neighborhood.

In the revenues of newspapers, however, there was no corresponding increase to offset the drain of increased expenditures for news.

The recent public sale of the Philadelphia Record, which may be regarded as representative of large and prosperous publications, adds confirmation to the foregoing statements. An accurate analysis of the business of the Record for most of the decade under consideration shows the following:

TABLE 56.—SUMMARY OF RECEIPTS AND EXPENDITURES OF THE PHILADELPHIA RECORD, WITH INCOME PER COLUMN FROM ADVERTISING: 1893 TO 1900.[1]

YEAR.	RECEIPTS.			EXPENDITURES.				PER CENT OF TOTAL EXPENDITURES.			Income per column from advertising.
	Total.	Advertising.	Subscriptions, sales, and miscellaneous.	Total.	News-gathering and wages.	Paper.	All other.	News-gathering and wages.	Paper.	All other.	
1893	$815,474	$487,360	$328,114	$617,542	$302,907	$227,489	$87,146	49.1	36.8	14.1	$59
1894	797,285	477,225	320,060	571,344	265,366	231,547	74,431	46.4	40.5	13.0	62
1895	848,478	552,587	295,892	598,369	281,303	239,266	77,800	47.0	40.0	13.0	60
1896	964,904	630,751	334,153	661,429	305,948	275,520	79,961	46.3	41.7	12.1	60
1897	885,934	594,337	291,597	668,328	332,325	266,195	69,808	49.7	39.8	10.4	59
1898	980,742	645,426	335,316	757,908	389,878	292,287	75,743	51.4	38.6	10.0	58
1899	1,073,917	722,205	351,712	769,019	411,931	291,693	65,395	53.6	37.9	8.5	57
1900	1,209,445	855,810	353,635	921,561	490,352	352,137	79,072	53.2	38.2	8.6	55

[1] Prospectus of the sale of the Philadelphia Record, Exhibit 1.

It will be observed from this summary that the proportion of expenditure for news gathering rose from 46.4 per cent in 1894 to 53.2 per cent in 1900, a difference of 6.8 per cent, and the earning power of a column of advertising fell from $62 to $55, a difference of $7 per column, or more than 10 per cent.

In connection with increase in expenditures it should be noted that toward the close of the decade there appeared a perceptible hardening in the price of paper. Urgency of demand had made such inroads into the supply of lumber available for wood pulp, that it was clear that unless more liberal laws were enacted the price of paper was likely to rise rather than become lower.

Because of competition, many newspapers cut the price of their issue to 1 cent per copy, and in spite of increasing circulation, there was thus an actual decrease in revenue from sales.

In the meantime, advertising, the other source of newspaper income, showed no marked increase. The department store, though a liberal advertiser, did not compensate for the multitude of smaller retailers whom it supplanted. Taking advantage of the concentration effected in advertising, as elsewhere, the department store advertising agent offered contracts for as much as a thousand columns at a time, and these huge figures extorted from the publisher the lowest possible price.

By 1900 it had become customary for large advertisers to form combinations; it is said that the patronage of fewer than twenty advertisers forms more than half the total quantity of advertising appearing in the daily newspapers of New York city. The only new source of income in the field of advertising was found in newcomers—principally tobaccos, whiskies, cereals, and books. Of these interests the publisher, formerly the most conservative advertiser, became the most daring. The professional advertising agent might be termed another cause of loss to the daily paper, to the amount of the commissions exacted. Between the opposing perplexities of competition and combinations of the advertisers there has been a decline in the advertising earning power of leading newspapers.

After passing 300,000 circulation, the value of advertising becomes a race between the receipts from that source and the cost of white paper. The advertising in one of the New York evening papers with circulation much exceeding 300,000 was recently declared to entail a cost of 21 cents per line for white paper. Evidently the publisher who secures a circulation of huge proportions confronts the necessity of securing from his advertising patrons a return of the cost of the paper space which they occupy, with a margin of profit. For reasons already noted, the profit is in many cases uncertain, and, as the decade drew to a close, for certain newspapers in the great cities a new problem arose.

The population had become so vast, and means of communication with surrounding territory so easy, that systematic search for circulation had been rewarded by enormous sales, the penalty for which was reduction or complete wiping out of profit on advertising. The circulation ball, once in motion, is not easy to stop, and the serious nature of this problem appeared when the cost of white paper occupied threatened to exceed the return from the advertiser. At the close of the decade such a possibility confronted several American daily newspapers. Overcirculation necessitated also an increase in capital invested in plant, with the added burden of interest which it represented. It may be said, therefore, that at the close of the decade from 1890 to 1900 the daily newspaper was more of a public institution than ever before, because it sacrificed an increased share of its revenue for the public benefit, obtaining no compensating financial return from either purchaser or advertiser. This was a condition very much to the advantage of the public, but one which tended to periods of reduced dividends in those establishments appearing to be most prosperous. Daily publications suffered from the rage for enlarged business and narrow profits so characteristic of all industries during the decade, but the relief which other callings found in combinations was not open to the publishers of daily newspapers, because the inequalities of circulation forever make combinations of newspapers impossible. Prosperity for the daily newspaper clearly lies in a middle course, if conditions permit, with respect to both news and circulation.

The changes which occurred in weekly publications during the last decade were not such as to merit more than passing consideration.

In weekly publications of general circulation devoted primarily to news, a distinct decline set in, doubtless as a result of circumstances which have been referred to in connection with the tables. Many such publications were discontinued; for example, the *New York Times* and the *New York Sun* abandoned the weekly editions long published by those papers, and the widely-known *New York Weekly Tribune* was saved from the same fate only by being made an agricultural paper. It should be mentioned, also, as indicating the tendency of the period, that the semiweekly *Tribune* was made a triweekly.

Notable additions to the class of important weeklies, devoted to literary subjects or illustrated matter, and possessing large national circulation, were the *Saturday Evening Post*, of Philadelphia, and *Collier's Weekly*, of New York. Other publications, devoted to the subjects mentioned, and national in scope, maintained a prosperous circulation.

In the field of monthly magazines the most notable change which occurred during the decade was the creation of the 10-cent magazine. The leading publications in this class were *Munsey's Magazine*, established as a 25-cent publication in October, 1891, and reduced to 10 cents in October, 1893; and *McClure's Magazine*, established as a 15-cent magazine in June, 1893, and reduced to 10 cents in July, 1895. The *Cosmopolitan*, which had long existed as a 25-cent publication, varied its price to 12½ cents and 15 cents, reducing to 10 cents in 1895.

The immediate effect of the reduction in price of *Munsey's Magazine* to 10 cents was to increase the circulation to such an extent that it was difficult to supply the orders, and the production of the first edition at the reduced rate was stopped in order to begin work upon the next issue. In the case of *McClure's Magazine*, reduction to 10 cents caused the circulation to double, and before the end of the first year it had reached about 150,000.

When the reduction of price to 10 cents was made, it was generally regarded as a foolhardy proceeding. The opposition of the news companies made it necessary to handle independently the distribution of *Munsey's Magazine*. It was not realized by many well-informed publishers that the time was ripe for such a change. Improvements in mechanical production had progressed so far that it was at length possible for a daring manager to produce an excellent magazine at a trifling cost per copy. Moreover, the public, accustomed to cuts in prices in other directions, were in a frame of mind to welcome such a change. It should be remarked that advances in machine composition and in making illustrations, while of much importance, represented but a part of the initial cost, and were, moreover, a fixed figure, regardless of the size of the edition. These items, therefore, were not of much consequence in producing a great number of copies. The principal factors were the improvements in presses and in machines for stitching and covering, which greatly reduced the cost per copy.

Publications of this class may be regarded as a variation of the old-established and more expensive magazine. They at once supplied an evident want, and have attained to an enormous aggregate circulation. Possessing different characteristics, they reached a different class of readers, circulating not only in the United States, but in Canada as well.

Munsey's Magazine is noted for the large number of illustrations employed, and for the use of material that deals with people and timely topics, avoiding descriptions. This magazine averages 160 pages of reading matter and 80 pages of advertising, or a total of about 240 pages and cover.

The leading characteristic of *McClure's Magazine*, in addition to articles by well-known writers, is the presentation of subjects of current interest, completely worked out in all their details as soon as the topic has actually been completed. In character of material used, the *Cosmopolitan* follows a little more closely the policy of the older magazines. In all magazines of this class, except the *Argosy*, illustrations are freely used. There is unquestionably an evolution of daily newspapers, through their Sunday publications, toward the field occupied by the inexpensive magazine, which, before the completion of another decade, may have some decisive result. Meantime the importance of the inexpensive magazine, and its educating force in the community, must be given due weight. The combined circulation of the monthlies published by F. A. Munsey, the *Ladies' Home Journal*, *McClure's Magazine*, and the *Cosmopolitan*, in 1900, was 2,483,000 copies per issue.

TYPE FOUNDING.

There has been no material change during the past two decades in the manner of designing types, but the process of executing the design is different from that formerly employed.

For the laborious and delicate task of punch cutting, a machine known as the Benton punch cutter came into general use about 1885. This consists of a light framework a little over 5 feet high, occupying a floor space of 22 by 28 inches. About three feet from the floor a table is set in the machine. The preparation of a model for the Benton punch cutter begins with a pencil sketch, on paper, of letters 12 inches high. The drawing is reproduced by a pantograph, in the form of a model letter 3 inches high, with raised outline. An electrotype of this letter is then prepared, and is fixed firmly upon the platform or table of the machine, beneath a tracing needle or index. To the head plate of this index are attached the four rods holding the cutting mechanism, which is at the top of the machine, and consists of a rapidly revolving borer, fixed in a stationary position and in a movable framework, in which is set the bar of steel or other metal which is to be cut. The leverage of the machine is capable of various adjustments, so that from the same model letter any body of type, from 2-point to 72-point, can be cut with equal facility and exactness.

The operator moves the index over the model letter on the platform, bearing down upon the lower parts and pressing against the sides of parts in high relief. The direction given to the index, at the will of the operator, upon the outlines of the model letter, is faithfully repeated by the tools cutting the punch. The cutting tools, of which two or three kinds are used in succession, are made with the utmost care. Being very highly tempered and being operated at very high speed, by steam power, they cut into the steel along the lines indicated by the movement of the guide over the model letter. The punches which are produced by this machine are finished in all points, requiring no hand work. Besides being produced more rapidly than those made by hand, these punches are more accurate, the counters are deeper, and the bevels are truer and always of uniform slope. This machine may be arranged to reproduce model letters in either direct or reverse order.

Where the punch is to be employed in making matrices by the driving process, as is necessary for small characters, hard steel is used. The matrices for the larger characters are made from soft metal by the electrolysis process.

The automatic type-casting machine was invented by Mr. Henry Barth, of Cincinnati, and patented in 1886. The machine is now in general use in type foundries, both in the United States and in England, and has been largely instrumental in reducing the price of type. It delivers completely cast type, perfect in all respects and ready for use. In the office of the *London Times* a new dress of type is cast daily by an automatic type-casting machine, which, though seemingly deliberate in its operation, casts 1,000 types a minute. The old dress of the *Times* goes daily into the melting pot, and a new one takes its place. In that office this system is preferred to the use of the linotype or other composing machine.

The first practical attempt at uniformity in type bodies was made in France, by the type founder Fournier, in 1737. His system, which was quite complicated, did not come into general use, but after his death it was improved by Didot, a type founder of Paris. The systems of Fournier and Didot are still followed to some extent by French type founders.

In America the first practical attempt to establish correct proportions between different types was made by George Bruce, a New York type founder, in 1822, but his method was not adopted by other American founders. After the Chicago fire a firm of type founders in that city—Marder, Luse & Co.—planned a system of bodies based on 6 picas to the inch. Later they took as their standard the pica made by the MacKellar, Smiths & Jordan Company, as the one which the majority of American founders and printers would prefer, and regraded the other sizes according to the methods of Fournier. In 1878 they placed on sale type made on what they called the American system of interchangeable type bodies.

At a meeting of the American Type Founders' Association, in 1886, a committee was appointed to examine into and report upon the new system. There was some objection to the pica as a standard, but the majority of founders finally agreed to accept it as the basis of the point system. The twelfth part of a pica, called a point, was taken as a unit, and all bodies of type were placed on multiples of this point and called by numerical names: pica became 12-point; long primer, 10-point; brevier, 8-point; nonpareil, 6-point, etc.

The American system follows the system of Fournier and Didot, except in the unit of measure employed. The following statement shows the names of the principal bodies or sizes of type in use in England and in America, with the names of these sizes under the point system: .

Names of type bodies.[1]

American.		English.
New name.	Old name.	
60-point	Five-line pica	Five-line pica.
48-point	Canon, or four-line	Canon, or four-line.
44-point	Meridian	Two-line double pica.
40-point	Double paragon	
36-point	Double great primer	Two-line great primer.
32-point	Four-line brevier	
30-point	Five-line nonpareil	
28-point	Double english	Two-line english,
24-point	Double pica	Two-line pica.
22-point	Double small pica	Double pica.
20-point	Paragon	Paragon.
18-point	Great primer	Great primer.
16-point	Columbian	Two-line brevier.
14-point	English	English.
12-point	Pica	Pica.
11-point	Small pica	Small pica.
10-point	Long primer	Long primer.
9-point	Bourgeois	Bourgeois.
8-point	Brevier	Brevier.
7-point	Minion	Minion.
$6\frac{1}{2}$-point	Minionette	Emerald.
6-point	Nonpareil	Nonpareil.
$5\frac{1}{2}$-point	Agate	Ruby.
5-point	Pearl	Pearl.
$4\frac{1}{2}$-point	Diamond	Diamond.
4-point	Brilliant	Brilliant.
$3\frac{1}{2}$-point		
3-point	Excelsior	Minikin.

[1] From Theodore L. DeVinne's Practice of Typography; Plain Printing Types, page 54.

In the autumn of 1892 the American Type Founders' Company was established. The majority of the type foundries of the United States became branches of this organization, which now practically controls this branch of the industry.

COMPOSING AND TYPESETTING MACHINES.

The Mergenthaler Linotype.—The linotype machine, invented by Ottmar Mergenthaler, of Baltimore, Md., became commercially successful during the early part of the decade. This machine is less than 5 feet square, and weighs about 2,000 pounds. It consists of a bank of keys connected with a magazine containing about 1,500 brass matrices—small plates about an inch high and half an inch wide, the thickness varying with the type character. On one edge is the die from which is cast the letter, and at the upper end are a series of nicks or teeth for distributing purposes, every character possessing a different combination. Each magazine contains a number of matrices for each letter, and all the usual characters required by a complete font of type, together with spaces, quads, etc., of varying thicknesses. In addition there are also flat, elongated, wedge-shaped spaces which are inserted between words and employed for justifying each line as it is cast. The magazine containing the matrices is an inclined receptacle 2 feet 6 inches high, the top being about 6 feet from the floor. Within this magazine are channels in which the matrices for the different letters are stored, and through which they pass. The machine is so adjusted that as the keyboard is manipulated the matrices are selected in the order in which they are to appear in the slug or casting. When a key is depressed, the matrix to which it corresponds emerges from its channel, is caught upon an inclined traveling belt, and is then carried to the assembler, or stick. As each word is completed, a stroke of the space key inserts the wedge-shaped space used between each two words. When the line is completed the operator can correct errors by extracting matrices or substituting others for those which are in the line. The wedge-shaped spaces are now pushed up through the line, securing instantaneous and complete justification. The completed line is then transferred automatically to the front of a mold extending through a mold wheel at the left. Behind the mold is a melting pot, heated by gas or gasoline, and containing molten metal. Within the pot is a pump plunger leading to a perforated mouth arranged to close the rear of the mold. When the matrix line is in position the automatic operation of the plunger forces the metal into the mold and against the line of matrix letters, where it instantly solidifies in the form of a slug. The mold wheel then makes a partial revolution, bringing the mold in front of a blade which pushes the slug into a receiving galley, ready for the proof press.

In order to insure accuracy in height and thickness of the slugs, knives are arranged to act upon them during their progress to the galley. The slugs thus prepared are type-high, and when arranged in order look exactly like a type-high, metal-backed stereotyped plate cut into slices one line deep.

Having served their purpose in front of the mold, the matrices are returned to the magazine to be utilized in new combinations. The distribution is accomplished automatically. The line is lifted from the mold by a long arm, and shifted laterally until the teeth at the tops of the matrices engage the teeth of a bar which is lowered to receive them. This bar then rises, lifting the matrices to the distributor at the top of the machine, but leaving the wedge-shaped spaces behind to be shifted to their magazine, which is to the left of the matrix magazine, and about on a line with its foot. The matrices, having been lifted to the top of their magazine, are pushed along a distributor bar by continually-moving longitudinal screws beneath. The distributor bar, which is made in a single piece, is fixed horizontally over the upper end of the magazine, and is supplied with longitudinal ribs or teeth adapted to engage the teeth of the matrices and to hold the latter in suspension as they are carried along the bar. The teeth of the bar are cut away to produce a different number or arrangement over each of the channels. Each matrix remains engaged and travels over the mouths of the channels until it arrives at the point where its teeth bear such relation to those of the bar that it is permitted to disengage itself and fall into its own channel. It is thus clear that the operation of the machine permits the composition of one line, the casting of a second, and the distribution of a third to be carried on simultaneously. The casting operation can also be arranged to work independently of the rest of the machine. It is said that this machine is capable of a speed greater than that at which the most skillful expert can operate the keys. The average product of a good operator is 4,000 ems per hour. Many operators, however, can produce from 5,000 to 6,000 per hour, and a speed of 13,000 is on record. There are three styles of mold—the first from 30 ems to 19 ems pica, the second for any measure between 24 and 13 ems pica, and the third for measures from 14 ems to 5 ems pica, inclusive. Each magazine contains matrices for any face of type, and the usual range of type faces is now from ruby to pica, or 12-point, though some matrices have been made for 14-point. Various faces of letters, and the alphabets of different languages, can be supplied with this machine. There are also combinations such as casting a 6-point face on a 7-point body, or a 7-point face on an 8-point body, in order to secure the effect of leading. The machines are equipped to permit an exchange of matrices or molds, and they can now be adapted to produce any practical face or any desired body, provided the line does not exceed 5 inches in width.

The Linotype company makes all the matrices required for its machines, employing the Benton punch cutter extensively in the preparation of the characters. Until 1899 it was impossible to employ in this machine more than one face of type at a time—the use of italics, for example, was impossible with body letters; but in the year mentioned one of the officers of the linotype company invented a two-letter matrix. The principal letter is a body character, and is placed above the other, which is italic, small capital, or bold face. To utilize the two-letter device, a special finger key is provided, which moves a small slide into or out of the assembler.

When the slide is drawn forward, the matrices entering the assembler assume the customary height and are delivered to the mold in position to produce the upper or body characters. If italics or small capitals are desired, it is necessary only to draw out the lower end of the finger key, causing the slide to move inward, so that the matrices added to the line will be arrested and sustained at a higher level than the others, causing their lower or secondary characters to be presented in casting position. By the operation of the finger key the line may be made to consist wholly of body face, italics, or small capitals, or of any combination of these faces required. The field of operation of the linotype machine has been much extended by the introduction of the two-letter device. It is stated that about 8,000 machines are in use in the United States, perhaps half that number in Great Britain, and a large number in Germany, France, and other parts of Europe. About one thousand new machines are put in operation each year. They are now in general use in the large newspaper offices in the United States. In addition to greatly cheapening the cost of composition, they possess the added advantage of supplying what is in effect a new font of type with every issue, the slugs being returned to the melting pot after each use. Another advantage is the ease with which the slugs can be handled. As they represent lines instead of individual letters, they can be manipulated with great rapidity.

The Scudder Monoline.—The Scudder monoline machine manufactures a solid line of type, or type bar. It is automatic in all of its functions, and is operated by one man, by the manipulation of a keyboard. The different parts of the working mechanism are attached to a solid, three-legged cast frame, and are in full view and within easy reach of the operator. The machine is 3 feet 6 inches high, 4 feet long, and 3 feet 6 inches wide, occupying about as much floor space as a printer's three-quarter case frame.

The principle governing the operations of the monoline is much the same as for the linotype, the main difference being in the construction of the matrix bars; those for the linotype carry a single intaglio, while the monoline uses matrix bars, each having 12 characters indented on the front edge. These matrix bars, of which there are 500, are stored one behind another in a magazine about the size of an ordinary photographic camera. As the keys are struck on the keyboard the matrices and spacers descend into the assembling box, traveling a distance of about four inches, and the bars are dropped more or less, according to the position of the letter to be brought in line to be cast. When the line has been completed to approximately its full length, the operator strikes a lever at the right of the keyboard and begins the composition of the second line, while at the same time the machine automatically justifies the first line, carries it to the casting pot, delivers it upon the galley, and returns the matrices and spacers to their respective receptacles in the magazine. The machine will not cast a line which has not been properly justified. After being once brought into use, a matrix bar or spacer is not employed again until all others of the same kind stored in the magazine have been used in turn.

The Lanston Monotype Machine.—The Lanston monotype machine was invented by Tolbert Lanston, in 1886, but was not placed upon the market until the latter part of the last decade. The principle upon which it is constructed differs radically from that of the linotype. The monotype produces single types cast in the order of their use, and set in automatically justified lines. It consists of two machines—a perforating device operated by a keyboard, and a casting machine. The keyboard differs from that of the typewriter only in the much greater number of characters, of which there are 225, comprising a complete font, including italics and small capitals. The keys are arranged in 15 columns of 15 rows each, with 2 extra rows at the top to secure justification. For each series of characters in the font a different color is used, so as to distinguish italic from roman, etc. The keyboard is between 3 and 4 feet from the floor and is supported by an iron bar upon a base 1 foot square. At the top of the machine is a roll of paper which unwinds from one spool and winds on another as the keys are struck, and also a paper scale for registering the body size of the type.

Before beginning his task, the keyboard operator sets an index of the number of ems required per line. Each stroke of a key perforates the paper ribbon in such a combination as to control the matrix of the proper letter in the casting machine, and causes the registering scale to charge to the line an amount equal to the body width of the type just selected. In this way a line of matter is progressively perforated and charged until, as the end is approached, the line scale shows that the next word or syllable can not go into that line, while another portion of the registering scale indicates the amount of unfilled space in the line just perforated if it should be cast with its spaces of normal body size. Still another portion of the scale has been keeping account of the number of spaces used between words of the line which may be varied in the process of justification. The machine thus mechanically notes for the operator the amount of space to be added and the number of space types among which the variation from the normal body width may be apportioned. At the completion of each line the operator, by merely noticing the figures shown by the pointer on the justifying scale, knows at once what additional holes to perforate in the record in order to secure perfect justification. When he has touched the justifying keys the registering scale recedes to zero, advancing again as the new line progresses. These operations are all automatic.

From the perforator the spool passes to the casting and setting machine, an intricate piece of mechanism about 4 feet high and slightly less in width, weighing about 1,200 pounds. On being placed in the casting machine the ribbon is unwound in reverse order, the operation of casting and setting proceeding in like manner. The control of the casting machine by the perforations in the ribbon is effected by the pressure of air passing through the holes as the ribbon moves over a rounded plate. Within this plate are 32 air tubes, and, as different perforations appear, different connections are made through these tubes with the working parts of the casting machine, a pressure of 8 pounds being maintained. The 225 matrices are contained in a die case measuring about 3 inches square. The matrix case shifts its position according to the combination of perforations passing over the air tubes. The perforations for justification regulate the casting of space types between words, causing the mold to be opened in the degree indicated by the justifying holes, in order that the space types may be cast of the proper size. Thus, from the record ribbon made at the keyboard, the casting machines cast type and insert mathematically correct spaces at constant speed, which may be kept up up to the limit of cooling metal. It is the work of only a few moments to remove one matrix case and substitute another. Moreover, the molds in which the bodies of the types are cast, also, may be exchanged at short notice. At one side of the casting machine is a melting pot, in which an automatic plunger forces the hot metal into a nozzle leading directly to the mold upon which the matrix rests. The metal is forced against the matrix, which is filled first, and then instantly occupies the body of the mold under pressure, insuring a good cast. When chilled the types are ejected through the mold into the carrier, which carries them to the line in the galley. As each line is completed, it is advanced automatically to make room for the next. The correction of matter set on the Lanston machine is the same as in hand composition; it is not necessary to recast a line, as in the slug machines. In the operation of the Lanston machine it is customary first to cast a font of type to be used in making alterations by hand.

It should be observed that the keyboard and casting machine have no connection whatever, and that each part can be operated independently. A keyboard operator can set matter as rapidly as he can read the copy and strike the keys, a speed of 5,000 ems per hour being regarded as a moderate average. The type-casting machine casts and produces, according to the body size, from 75 to 125 ems per minute, or from 4,000 to 5,000 per hour. It can be adjusted to cast type on bodies ranging from 5½-point to 12-point, with various faces.

The advantages claimed for this machine are perfect justification, the convenience of being able to operate the two parts separately, the employment of matter set from single types, and therefore easily and quickly corrected, and the ability to produce a font of type at every operation. Although they have not been long in practical operation, many of these machines are in commercial use.

The Goodson Graphotype.—The Goodson graphotype machine was first placed upon the market in 1899, by J. H. Goodson, and depends upon electricity for its successful operation. It is composed of two parts: a small table about the size of a typewriter desk, containing an ordinary typewriter, a perforating machine, and a small dial similar to a clock; and a caster and setter. The typewriter is in all respects unaffected as far as facility in writing is concerned. The operator is required, in addition to the execution of ordinary typewriting, to notice, when the end of the line is reached, the dial which controls the spacing, and to touch the key indicated by the dial, thus automatically spacing and justifying the line.

Each time a key is touched, not only is the proper letter written on paper, but an electrical communication is made with the perforator, which perforates a narrow paper ribbon in series of round holes so arranged that when the ribbon is placed in the casting and setting machine a similar electrical connection is made through this perforation, by indicating the letter or space to be cast and set. The advantage of a visible, typewritten sheet is obvious. It is accessible to the operator for reference, and it may be read by the proof reader instead of the first proof, as the type and the typewritten page are identical so far as the orthography is concerned. The ribbon, together with the corrected typewritten sheets, may be put away indefinitely for reprint or for possible use in the future, without expense for retaining metal. The same perforated ribbon and corrected first proof can be used in the casting machine to set from 5½ to 12 point type, the size or style of type required being determined at the caster, not the perforator.

The caster and setter resembles a sewing machine, being but little larger. It is operated automatically, and controlled by the perforated ribbon already mentioned. It casts and sets type continuously at a speed of 5,500 ems per hour, and has reached a speed of 8,000 ems per hour. The metal pot is more than a foot from the mold, making it possible to cool the types rapidly, thus overcoming a difficulty which has heretofore limited the efficiency of casting machines. It is possible, therefore, to maintain the maximum speed mentioned. The molten metal is conveyed to the mold by means of an electrically heated tube insuring uniform temperature for type casting. The mold is also water-jacketed, to counteract the heat which the small jet of metal gives out in casting type. By this means the mold is kept at a temperature at which the type is immediately chilled throughout an indefinite run, insuring a perfect and well-cut face. The type itself is in all respects equal to foundry type, and can be distributed into the case and reset with the same facility. The size or style of type and the measure can be changed as rapidly as this could be done by hand. It is claimed that the advantages of this machine for setting tabular matter are very great—that it can be set at the same speed as straight matter, the rules being put in by hand.

The Dow Composing Machine.—The Dow system of composition, patented November 28, 1899, requires the use of two machines—a composing machine, which sets individual foundry types and delivers them automatically justified on the galley; and a distributing machine.

The composing machine is a little over 6 feet high, weighs 2,000 pounds, and occupies about 17 feet of floor space. It is operated by means of a keyboard similar to that of a typewriter, but with 90 characters. The keys descend only three thirty-seconds of an inch, and are used simply to release certain parts, the driving power of the machine accomplishing the rest of the work. For greater ease in handling, the main type magazine is divided into two parts. In the type channels, which are 4 feet in length, the types lie with their faces in sight, resting on their sides in order that a large number may be placed in one channel. For further increase of capacity, additional channels are devoted to letters in frequent use.

At each touch of the keyboard a single type is pushed from the magazine and advanced to a type raceway in front of and parallel with the magazine. This raceway, which is in a continuous horizontal line, widens at one end, so that as the type enters and is pushed along by a rapidly reciprocating type driver it is stopped at the center by the narrowing of the raceway. From this position it is conveyed, by a blade operating in harmony with the type drivers, into an upright channel or "stick," each type forcing down the preceding one. To set a line of quads the operator simply keeps his finger on the quad key, and the quads are set in the stick at the rate of 10 per second until the line is filled. As the types enter the stick their faces are presented directly in view of the operator, who can read and correct them at will. A bell gives warning when a line is approaching completion, and a gauge at the side of the channel in which the line of type is formed, shows how much the line is short or how far the operator has overrun the standard measure he is setting. When the line is full the operator touches the line key, and then, without further attention on his part, and without delaying the composition of the next succeeding line, the stick of type turns halfway round and the line of characters is thrust by a blade to a point on the raceway called the "bridge," where the process of justification begins.

During the process of composition plain, type-high, rectangular bits of brass are used temporarily to separate the words; at the bridge each word is removed from the forward end of the line and carried to the galley, where the temporary space is extracted and returned to the setting case, the proper justifying space being substituted. The justification is accomplished by means of an automatic calculating device placed at the back of the machine. This calculator registers the shortage in the line and the number of spaces among which this must be divided, divides the shortage as equally as possible among the number of spaces indicated, and sets in motion another mechanism which ejects the required spaces and places them between the words as they pass in succession along the raceway to the galley.

Safety devices are provided to protect the machine from accident or carelessness. Should anything get into the raceway at the foot of the channels, the sliding shoe on the type driver unlatches from the driving mechanism, so that the reciprocating parts go on working, clear of stoppage. If by any chance the stick becomes choked, so that it can not turn at the proper time, the ejector blade is stopped, thus preventing injury to the stick. All movements of the machine are positive, there being no dependence whatever on gravity, centrifugal force, magnetism, air pressure, or the like, and the operative force used is only one-half horsepower.

When one of the sorts is exhausted, if it be one of the duplicated channels the next channel is brought into action by means of one of a series of levers over the keyboard; if the type sort be entirely exhausted it is replenished from the distributor. When the magazine requires refilling, it is let down by a hand crank, lifted out by the handles, and taken to the distributor.

The Dow distributor is entirely separate from the composing machine, but its mechanism is of the same positive character. The operation by which it distributes the various types in their respective channels is automatic, and allows a normal speed sufficient to supply three composing machines with type. For purposes of distribution the body of each type character has a special identifying nick. The distributor, which lies flat, consists of a central disk joined to a set of channels radiating like a fan. Upon the periphery of the disk are supported 36 type carriers, and as these are rotated past the galley channel on one side, each receives a single type, which is carried round until it is opposite the proper channel, when it is pushed out of the carrier into the channel, the distributor continuing its rotation.

The Simplex One-man Type Setter.—The simplex machine is a combination of the Cox typesetting machine and the Thorne machine. It performs the two operations of composition and distribution, either simultaneously or one at a time, as the operator chooses. It occupies less space than a printer's stand, weighs 800 pounds, and requires less than one-fourth horsepower to drive it. The body of the machine is formed of two cylinders about 1½ feet in diameter, one directly above the other. The lower, which is about 2 feet high, is stationary, but the upper, whose height is about 9 inches, rotates in the common axis. In each cylinder, extending vertically their full length, there are 90 parallel channels, slightly wider than the body of the type which the machine is made to set; those of the lower form a magazine into which type is distributed from the channels of the upper cylinder, to be stored for resetting.

Each key on the keyboard is connected by levers and wires with a small plunger at the bottom of its particular channel. When the key is depressed the plunger is moved forward and ejects one type on to the flat surface of a rapidly moving disk encircling the bottom of the cylinder. The type is conveyed quickly to the right-hand side of the machine, collisions of type on the way being prevented by the scimitar-shaped guards between each two channels, which prevent the types from interfering with one another and guide them as they start on their run on the disk. A switch deflects the type from the disk to a flat traveling belt which runs parallel with the disk at this point, and which conveys the type to the "separator"—two rolls with just enough space between to permit the passage of a single type, so that if the operator has played two types which are traveling side by side they are separated before proceeding farther. The types are now guided, one by one, to the packer, where they run on a cam, are lifted, and are then carried forward to proper position. Types succeed each other in the packer with 3-em space between the words, until a continuous line is formed extending across the back of the keyboard, with the face in view. At this point the operator, who is on a seat attached to the body of the machine, swings himself to a place at the left, where the justifying mechanism is situated, separates from the long line about enough matter to fill a line of the width of the column being set, and justifies and corrects it by hand; he then touches a thumb lever beside the galley, releasing a pawl which engages with a ratchet on a rotating wheel under the keyboard. In one revolution of this wheel, the rule which stands behind the type line is drawn down below it, while a line pusher comes up in front of the line and carries it into the galley which rests on a support behind the rule. For "leading" matter automatically there is a receptacle—which the operator can easily keep supplied with leads—out of which, by the action of a small lever, a lead can be delivered behind each line as the line pusher carries it into the galley; if more than one lead is desired, the thumb lever is held out until the needed number of leads has been supplied.

The distributing mechanism is at the rear of the upper cylinder. The galley of dead type to be distributed is placed sidewise (the lines of type being vertical) on a bracket, upon a solid upright fastened to the body of the machine. In each channel of the distributing cylinder there is a weight which rests on top of the column of type. When an empty channel, in its revolution, reaches the loading point, its weight, being low, trips a trigger attached to the releasing mechanism and the vertical lifter and plunger cam shaft is started, making a complete revolution. The lifter arm carries up the weight, thus leaving the channel clear while the "plunger" is moved forward and a line is pushed from the galley into the channel. After one line has been extracted from the galley, a spring moves the column forward so that the next line is in position to be loaded into the distributing cylinder. As the shaft continues its revolution, the lifter arm is dropped and the weight is lowered upon the line of type where it rests, aiding the force of gravity in making each type drop into its proper channel in the magazine cylinder. For this system of distribution each type character in a font is given a combination of nicks, and the channels are so grooved that they are closed to all type not fitted, by the combination of nicks, to pass.

All the channels in the upper cylinder are filled in turn. The cylinder revolves with a step-by-step motion, each of its channels being brought in turn over each channel in the stationary magazine cylinder below and held rigidly a moment to permit the dropping of each type as it comes to its proper channel.

In the practical operation of this machine it is not necessary to keep the distributor working without interruption, since it supplies type faster than the operator can set it up. With every channel in the upper cylinder empty, the replenishing can be dône in three-quarters of a minute.

The sorts in the different channels distribute in about the proportion required by the operator, but provision is made for removing quickly any sorts which distribute faster than is required, and for replenishing the supply of sorts which do not distribute rapidly enough.

STEREOTYPING AND ELECTROTYPING.

The process of duplicating type surfaces by stereotyping has remained practically unchanged since its application to the requirements of newspapers in 1861. This process has been a necessary adjunct to the perfecting press, which prints from curved stereotype or electrotype plates. Advances in this form of press construction created a necessity for the rapid casting of stereotypes, and for many recent models, the duplication of pages. This demand led to considerable improvement in the direction of rapidity of production and ease of handling in stereotype plate casting.

The most notable improvements in the stereotyping process during the last two decades have been a matrix-rolling machine, constructed for making a specially prepared matrix, which is ready for the casting box when it leaves the press; improved drying tables; automatic casting boxes; combined sawers and trimmers; combined planers and shavers; improved machines for routing and beveling; and an improved half-tone beveling machine.

The autoplate, an invention of Henry A. Wise Wood, is a mechanical device for stereotyping. It is a solidly constructed mechanism, 4 feet high, 7 feet long, and 3 feet wide. The matrix is placed, face up, in a concave receiver, which slides forward into the casting box when the machine is set in motion. The bottom of the box rises and lifts the matrix close to a fluted cylinder, while at the same time a pump begins to draw molten metal from a caldron and force it into the casting chamber, under an elastic pressure, which follows the shrinkage of the plate with fresh metal. Sprays of water are used to cool rapidly the casting box and the cylinder. When the plate is completed the casting box falls, stripping off the matrix, and the plate is brought by the cylinder to the top of the machine, where a metal arm seizes it and carries it along toward the back, trimming and finishing it automatically on the way. Then the plate moves out upon a long arm, where a workman gives it the final preparation for the press.

The great advantage of the use of the autoplate over other methods of stereotyping is that much less time is required. At highest speed, hand work will produce but one plate per minute; the autoplate will produce three or four in the same time, and the quality of its work is pronounced superior to that of hand work. Another consideration of advantage to the printer is that fewer workmen are required to attend to the working of the autoplate than are necessary for hand work.

Stereotyping is still in general use in newspaper offices, because of speed. With respect to fineness and finish, electrotyping is far in advance of stereotyping, and is now used almost exclusively for book, magazine, and job printing.

In electrotyping the principal improvements are these: An important invention to stimulate the action of electro-deposition by the use of a dynamo; a black-leading machine which utilizes a blast of air; a combined metal kettle, wax-heating table, and case-filling table; a power wax-shaving machine; a hydraulic molding press; and improved saw and routing machines, including curved routing machines for use on both electrotype and stereotype plates. Process engraving, or the half tone, has developed new possibilities for the electrotyping process. The Muller patent half-softening hammers and punchers, and the Richards improved ruling machine, are inventions used in this work.

PRESSES.

Prior to 1870 printing presses were largely of two types: the platen or job press, in which the impression was made by direct pressure; and the cylinder press, consisting of a flat bed which held the type form in a horizontal position, and oscillated beneath a large revolving drum or cylinder carrying upon a segment of its surface the sheet to be printed.

Attempts had been made to construct a press which would permit the type to be placed upon a cylinder, utilizing the rotary principle that has been brought to a high degree of perfection in the modern web press. In 1846–47 Hoe & Co. produced a machine of this class. The type was locked on the surface of the cylinder, the curvature being assisted by V-shaped column rules. The sheets were fed separately to impression cylinders, and delivered by a sheet flier. This form of press was soon found incapable of meeting the demands of the larger newspapers.

The discovery, about this time, of the possibility of casting stereotype plates on a curve, from papier-maché matrices, was the key that opened the way to the ingenious and complicated printing presses of the period.

Job Presses.—The improvements in job presses consist largely in details relating to the various classes of work for which they are intended. In the general construction of this class of presses few radical changes have been made, and standard patterns long in use need not be described here. The most radical departure within the last few years has been the employment of the rotary principle, as exemplified in the Harris automatic press. In this press the printing surface is a curved electrotype plate, though separate types can be fitted into a type box adjusted to the printing cylinder. The press prints upon separate sheets which can be fed either by hand or by an automatic arrangement; the automatic feeder carries several thousand sheets of paper, which are fed from the bottom by an ingenious device permitting the renewal of the pile without stopping the press. The speed of this press is from 5,000 to 14,000 impressions per hour, according to the class of work.

The Kidder Press Company manufactures job presses which feed automatically from a roll.

Cylinder Presses.—Until the close of the last decade the cylinder press was the main reliance of publishers for larger work, such as books, posters, and all large forms. It was in general use also for papers of small circulation and for all high-class work. Improvement in perfecting presses has to some extent caused the displacement of the cylinder press, but it is still generally used.

There are four kinds of cylinder presses in use—the drum cylinder, the double cylinder, the stop cylinder, and the two-revolution cylinder. Of these, the last named is now regarded with the greatest favor.

The past twenty years have witnessed numerous improvements in the three styles of presses last mentioned. From the old, cumbersome drum cylinder, still in operation in many country newspaper offices, with a speed of 1,200 to 1,500 per hour, to the modern, rapid two-revolution press, with all its delicate adjustments and labor-saving devices, is a very great advance.

From the old-fashioned drum-cylinder press was evolved the double cylinder, a duplication of the cylinder, by which the capacity of the press was doubled. The cylinders were fed alternately. The stop-cylinder press was so named because the cylinder stops at a certain point in its revolution, thus permitting greater accuracy in feeding. Owing to the exactness with which the sheet was printed—technically called "register"—this press was used where fine grades of work, such as half-tone or color work, were required. It attained great popularity, but has been supplanted by the two-revolution press, because the latter possesses much greater speed and nearly equal accuracy. In this press the cylinder is smaller, and revolves twice at each impression, once in contact with the type and again in a slightly elevated position while the sheet is being released and the form returned to its former position.

In 1885 Robert Miehle made a number of improvements in the two-revolution press, which increased its capacity and brought it into more general use. Since then this type of press has been subject to continuous improvement. The Century two-revolution press is one of the most perfect machines of this class. The constant aim of improvements in this field has been to increase speed and accuracy, and to give the utmost facility in adjustment and operation. Among recent improvements in the two-revolution press are the substitution, for cam gears, of a crank movement of the bed; an adaptation of the stop-cylinder principle; and perfected methods of ink distribution.

Perfecting Presses.—In the web perfecting press occurred the most noteworthy development of the past two or three decades. While modern presses of this class possess remarkable capacity, they are the result of improvement, rather than a radical departure from the earlier form of rotary presses. Various mechanical problems, resulting from high speed, were met and solved; among these were the questions of combining the printed sheets, cutting, folding, and preventing the offsetting of ink. Although attempts were made before 1870, in this country as well as in England and France, to build presses embodying this principle, the machine constructed, in 1871, by Hoe & Co., of New York, may be said to be the first successful perfecting press. This press printed 15,000 papers per hour from one set of plates. In 1876 this firm brought out the rotary folder. The development of folding mechanisms has naturally kept pace with that of the press proper, until at the present time papers consisting of any even number of pages from 4 to 32 are turned out, cut, pasted, folded, and counted, in lots of 25 or 50, at rates of speed varying from 12,000 to 150,000 per hour.

The term "web perfecting" exactly describes the process employed; a roll, or "web," of paper passes into the press and is printed, or "perfected," on both sides before being cut and folded. The early form of rotary press was the "single." Then the length of the cylinder was doubled, thus doubling the capacity of the press—that is, printing a paper of the same size at twice the speed, or a paper double the size at the same speed, as the "single rotary." Then came the double-supplement press, with a set of single cylinders at one side, permitting the printing of 10-page and 12-page papers. The next step was to double the supplementary press, forming the quadruple press—a style in common use to-day—with a capacity of from 48,000 4-page papers to 12,000 24-page papers per hour. Instead of being arranged side by side, the presses were often constructed with the supplementary press on top, making a "double decker." The quadruple press was then converted into a sextuple press by the addition of a supplementary double press placed at one side. It was a simple matter to convert this into an octuple, a type of press now in use on such papers as the *New York Journal* and the *Chicago Tribune*. The octuple is sometimes constructed by piling four double presses one above another. One style of press, designed for the *New York Journal*, consists of two sextuples working side by side. This is a three-decker machine, equivalent to six double presses. In these presses each double-cylinder machine is fed from a separate roll of paper. The folding and cutting mechanism can be adjusted to assemble the pages in any desired combination within the limits of the press.

The illustrated colored supplements of the large city journals have been made possible by the adaptation of these presses to color printing, permitting the use of one, two, or three colors besides black. This principle has been carried still further in a rotary multicolor and half-tone machine, which prints in as many as eleven colors, and has a capacity 48,000 full-sized 8-page papers per hour.

Two general classes of the web press are made. In one, what is called the "angle bar" is utilized to turn the sheets in order to assemble them from the different webs. The other is designated the "straight line," the sheet being run through the press without being diverted from a straight course, and was invented by Joseph L. Firm, of Jersey City, N. J., who associated himself with the Goss Company, of Chicago, in 1890. By means of this invention greater accuracy in register was obtained, with less danger of tearing the running sheet in rapid work.

The Scott Company has produced an "all-size" rotary web press, by which pages of different sizes can be printed, the adjustment being graduated to quarter inches.

Another type of perfecting press is shown in the flat-bed "multipress" of the Campbell Company, and the Cox duplex press, in which the type beds are stationary, the cylinders rolling back and forth upon them. These are adapted to small country dailies.

Many variations in the perfecting press are made to order to satisfy individual requirements. Some of these even place colored covers upon their products and stitch or staple them. The colored supplements of newspapers are often printed in colors on one side and black on the other, and half-tones often occur on the same page in different colors. Music is printed on heavier paper and folded in with the supplement. All this is accomplished without marring the product. A space is often reserved also for a type column of late news, to avoid stereotyping another set of plates.

The presses of the Goss Company are fitted with an ingenious arrangement to prevent offsetting. Rollers made of molasses and glue pass over the freshly printed paper, absorbing the excess of ink, which is then transferred to a polished metal cylinder, from which it is removed by a cylindrical cotton wiper.

Toward the latter part of the last decade the product of the perfecting press was greatly improved, so that it became a competitor for the finer grades of magazine work, for which it is being utilized more and more.

Lithographic Presses.—Few changes of consequence were recorded in this branch of the industry during the decade. Aluminum plates have been employed with considerable success as a substitute for stones, but the notable feature in their employment is that they permit the use of the rotary principle. Special presses, constructed with great care to meet the exacting requirements of lithographic work, are manufactured for this process, and have attained some success.

PATENT BLANKETS AND MECHANICAL OVERLAYS.

There were many attempts to substitute mechanical processes for the laborious task of "making ready" by hand. Among the inventions of this class were the Savary, Dittman, De Vinne-Bierstadt, and Humphrey and Upham methods, all of which must be regarded, so far as general use is concerned, as still more or less in the experimental stage.

The Savary device is a blanket composed of a collection of very short wires. This blanket is mounted on a cylinder, and by equalizing the pressure serves to correct irregularities in the height of type and cuts. Another invention substituted a blanket of woven wire for that of pointed wires.

The Dittman process utilizes the expansion which occurs in wheat flour when dusted onto a fully inked impression.

The De Vinne-Bierstadt process utilizes the action of light upon gelatin in combination with other substances. A print taken on a thin sheet of transparent celluloid is dusted with plumbago to thicken the lines, and exposed in a photographer's printing frame over a film of gelatin. This film is afterwards swelled in those parts not made insoluble by the action of light, and from it a plaster of paris mold is made. From the latter a flexible reverse in gutta-percha is formed, and the gutta-percha, backed, becomes the overlay, being thickest in the darkest parts of the illustration.

The Humphrey and Upham process is of use only for duplicating overlays. This duplication is made by rubber or gutta-percha impressions of a reversed overlay.

ILLUSTRATING AND ENGRAVING.

The introduction of photoengraving, about the year 1875, marked a new era in the history of illustrating and engraving.

Wood and steel engraving were unable to fulfill the increasing demand of the public for large quantities of good, inexpensive pictorial work. Proper production of this work by hand was impossible, save by an artist of no mean ability. Accordingly, if illustration was cheap, it was poor; if good, it was expensive.

Half-tone Engraving and Zinc Etching.—The half-tone process is a method of making cuts suitable for use upon ordinary printing presses. The first step is the taking of a photograph on a wet sensitive plate, in front of which, in the camera, a fine screen is placed. These screens are an essential feature of the process, as they permit the accurate reproduction of the half tones in the object. They are made by mechanically cutting or scratching lines on two glass plates; these lines are then filled with some opaque substance, and the two plates are placed together, face to face, with the lines of one plate crossing those of the other. They are made in varying degrees of fineness, the lines ranging from 40 to 400 to the inch. The coarser screens are placed farther from the sensitive plate than the finer ones. The finer screens cut off about nine-tenths of the light; therefore, the negative is often exposed for eight or ten minutes.

After the negative is developed the film is stripped from the plate, reversed, and placed on another, called a turning glass, thus becoming a positive. This is placed in contact with a copper plate coated with a sensitized solution, and exposed to the light for about two minutes. After being developed, this plate is enameled and "burned in" over a flame. It is then etched with a solution of perchloride of iron. In this process the portions of the coated copper plate which have been exposed to the light in the printing process—in other words, the lines that were formed by the screen in the original negative—are etched away, producing a printing surface composed of dots which vary in size according to the lights and shadows of the object. Further processes pertain mainly to finishing and mounting. A certain amount of expert hand work is required for the finishing of the half-tone plate and its final preparation for the press. In this field many artists who were formerly engravers have found work.

Half tones are of three classes, considered according to the treatment of their background—the silhouette, the square-etched, and the vignette. The silhouette is an effect of sharply defined edges; the square-etched is an exact reproduction as to background, of the original picture; and the vignette is a production of softened, gradually-fading background, without definite termination.

Zinc etching is practically the same process, except that the copy must be a pen-and-ink or line drawing, and no screen is used. In the etching process, in place of perchloride of iron, muriatic acid is employed. This gives a plate which is cut deeper, but is less durable than the copper half-tone plate.

Three-color Process.—The attempt to print in colors from half-tone plates by means of photographic processes was partially solved by Frederick Ives, of Philadelphia, in 1888. Since that date the process has been improved with gratifying results. The principle upon which it is based is that by a combination of the three primary colors—red, yellow, and blue—almost any shade of color can be produced. Photographic plates that are specially sensitive to color are used. As in the half-tone process, a glass screen is placed in the camera. Three photographic negatives, each of which is to produce a separate printing plate, are made of the object. In each case a colored glass screen, excluding certain color rays of light, is used in front of the lens. In the production of the plate which is to print the blue ink, a red color screen is employed; to produce the plate for yellow ink, a blue-violet screen is used; and to produce the plate which is to print red ink, a green screen is used.

In printing from these plates great exactness, technically called "register," is required, in order that the colors may be laid on in proper place as the three impressions are consecutively made.

One serious problem which confronted the inventor was the difficulty experienced in so arranging the line screens that the diagonal lines would not form geometric patterns in the finished picture. This was solved by the discovery that by varying in certain ways the directions of the lines used for the three negatives, the pattern effect could be avoided.

Lithographic Color Printing.—A widespread but unsuccessful attempt was made, about 1880, to substitute zinc for stone in lithographic work. After this failure, zinc was generally abandoned as a factor in the lithographic problem, but one firm has continued to make experiments along this line with considerable success.

In 1898 the great superiority of aluminum over lithographic stone was demonstrated. Aluminum is far lighter, requires less space for storage, is cheaper, is almost noncorrosive, can be used in sheets upon rotary presses, can be used for longer runs without reproduction of the design, and after some manipulation possesses all the desirable qualities of stone.

The methods of manipulation are two. By the first, the surface of a sheet of fine-rolled aluminum is ground off, producing a porous surface. The second method is the formation of an aluminum surface by electrodeposition.

To prevent the ink from spreading over the limits of the design, phosphoric acid is used; this is removed from the plate by the application of nitric acid.

About four-fifths of present-day lithographic work is done on stone, but the number of printing machines constructed to use aluminum is rapidly increasing.

BOOKBINDING.

Recent advances in the bookbinding department of the printing and publishing business have been numerous, but not revolutionary.

Automatic feeding devices for folding machines, as well as for printing presses, are a product of the last decade. Of these there are many variations, but as the problem which they solve is comparatively simple they need not be described in detail. Three-fourths of the folding machines of the present day are supplied with automatic feeders. Folding machines have been greatly improved also by parallel-fold arrangements and by automatic pointing.

Many improvements have been made in wire-stitching machines. One of these machines will stitch anything from two sheets to a book 2 inches thick, and with several of them either round or flat wire may be used. There has been introduced recently a noteworthy combination folding and wire-stitching machine, which by a continuous and automatic operation takes the sheets from the feeders, and folds, gathers, collates, covers, and wire-stitches copies of magazines and pamphlets, delivering them ready for distribution.

Paper-cutting machines have been improved by the introduction of automatic clamps, indicators, and gauges.

The invention of a steam rounding and backing machine, increasing a capacity of from 500 to 1,000 books per day to a capacity of from 5,000 to 6,000 in the same time, should be noted. The latest case-making machine feeds itself from a roll of cloth which it automatically cuts into pieces of proper size for use. The cloth is first covered with glue by contact with a cylinder revolving in a pot of glue. It is then cut by the machine and nicked in corner sections; boards are supplied from a holder and a back lining from a roll, both receptacles forming parts of the machine. This process completed, the nearly finished product drops a little, the cloth is folded over the boards and back lining, and the binding, after passing through a case smoother, is delivered in a finished state. This automatic process is very satisfactory. Another interesting invention in this line is a machine for covering paper books and magazines, which has been known to cover 22,000 books in a day.

Among late inventions are a casting-in machine, for putting the body of a book into its cover, and a gathering machine.

During the next ten years the principal advance in bookbinding doubtless will be in those branches of the industry which are concerned with casting-in, gathering, smashing, folding, and sewing.

NEWS-GATHERING ORGANIZATIONS.

The only changes in news gathering since 1880 have been those of detail.

In 1880 the leading news-gathering association was the body then known as the Associated Press, which was furnishing news to 30 per cent of the dailies of the United States. This organization, composed of New York papers, gathered news for its own members on the cooperative plan, but exchanged news with other associations on terms that made the exchange practically a sale, a large cash bonus being asked from associations receiving their news.

These methods caused much dissatisfaction among the tributary associations. The claim was made that the parent organization, having absolute control of the news gathered, was selling it at a price covering the entire cost of collection, giving the news to its members practically for nothing.

The principal complaints came from the Western Associated Press, which in 1882 was paying a bonus amounting to $3,000 per month. The outcome of this controversy was an amalgamation of the Associated Press and the Western Associated Press into one organization, under the former title.

The next great conflict was that between the new Associated Press and the organization afterwards known as the United Press, which was founded in 1882. In 1884 the Associated Press and the United Press made a secret agreement for an exchange of services, by which a practical union of the two organizations was effected. It was claimed that the exchange was most unequal, the United Press getting the benefit of the wide field covered by the stronger organization, and giving poor and inadequate service in return. In 1891 the arrangement was discontinued; but in 1892 the eastern branch of the Associated Press—the original New York organization—transferred its affairs to the United Press, while the western branch—the former Western Associated Press—continued in business, with headquarters in Chicago, as the Associated Press. The new Associated Press, like the United Press and other proprietary bodies, followed the plan of selling its news to papers whose proprietors were not stockholders or members of the organization.

At the time of its organization the western association had contract relations with the eastern one. In 1893 the contract expired; the western association refused to renew it, and there followed a bitter war between the two associations, which was very disturbing and expensive to the newspapers of the country, some being compelled to receive news from both associations to insure a complete service. Strong efforts were made to bring about an agreement between the two organizations, but all failed because of fundamental differences in their plan of organization. In 1897 the United Press made an assignment, with large liabilities and no assets.

The victory of the Associated Press was not, however, the end of newspaper difficulties. This organization could not, under its regulations, admit to membership all the newspapers which were left without service by the failure of the United Press. Moreover, the associations which were organized to supply the needs of the papers not provided with a news service were declared to be antagonistic, and members of the Associated Press were forbidden to make contracts with them.

The *Chicago Inter-Ocean*, having received news from a bureau thus proscribed, and being threatened with suspension of the Associated Press service, applied for an injunction to restrain such action.

The circuit court and appellate court successively dismissed the bill, but the supreme court of the state (184 Illinois Reports, 438–455) reversed the previous decision on the ground that the corporation had a virtual monopoly of a commodity of vast importance to the public, had used its franchise in such a manner as to injure the public interests, and could not be allowed to deprive the public of the services of a newspaper.

This decision did not, however, break up the monopoly held by the Associated Press, but merely caused removal of that organization to New York state, where it was reincorporated on May 22, 1900, with practically all of its former 600 members and subscribers.

Under its new charter the Associated Press is simply a mutual and cooperative organization of newspaper proprietors. A distinction existing in the old organization between voting stockholders and ordinary members was abrogated in the new charter, and all newspaper owners who receive the news service of the Associated Press are now members of the organization on equal terms.

The certificate of membership designates in detail the name of the newspaper entitled to receive the news of the Associated Press, the language in which it is printed, its place of publication, whether it is a morning or an evening newspaper, and whether the member is to receive a day or a night report. A certificate of membership in the Associated Press is not transferable except in special cases.

Each and every member of the Associated Press is entitled to receive a service of news for the purpose of publication in the newspaper specified in his certificate of membership, and for that purpose only. Special regulations forbid, in detail, publishing news in any other newspaper than that specified, furnishing it in advance of publication to any person not a member, or anticipating the publication of documents of public concern confided to the corporation for use on a stipulated date, however the document may have been secured.

The Associated Press, as now organized, has four divisions—Eastern, Central, Southern, and Western—with headquarters at New York, Chicago, Washington, and San Francisco, respectively.

Domestic news is collected from all parts of these four divisions at the division offices, and exchanged between the several divisions, items being enlarged or condensed according to the territory in which they are to be circulated.

For gathering foreign news the Associated Press has contract relations with various news agencies, with which it exchanges news. Of these the most important are the Reuter agency, covering Great Britain and her colonies; the Agence Havas, covering France, Belgium, Switzerland, Portugal, and some parts of South America; and the Wolf agency, of Berlin, covering Germany, Hungary, Austria, and to some extent northern Europe and Russia. In the New York office of the Associated Press the Reuter agency has a representative who looks over the dispatches and sends abroad whatever American news may be of interest to Europeans. For Canadian news the Associated Press has exchange arrangements with the Canadian Pacific Railway, by which that company gathers all the news on its line and delivers it at Bangor, Buffalo, Detroit, and Seattle, receiving at those points the news of the United States, for use in Canada. Other agencies supplying news to the Associated Press are the Steffanie, covering Italy; the Nordischer Telegram Bureau, covering Russia; the Norsky Telegram Bureau, covering Norway; the Svenska Telegram Bureau, covering Sweden; and the Agence de Constantinople, covering Turkey.

While, as has been noted, each newspaper connected with the Associated Press contributes its quota of news to the general fund, the organization has regular correspondents of its own at places where it has no member. It also sends out its own reporters, when the occasion is of sufficient importance, to cover specific events, and employs special men to cover special classes of news—as, for instance, the Wall street market reports, and the arrival and departure of steamers at principal ports. It also has emergency men whose names are kept on file, and who can be called on at any time to gather news for the organization. At important points are stationed representatives whose duty it is to put the news into shape and file it for circulation throughout the country.

Besides the full reports delivered to large papers, the Associated Press distributes what are called "pony" reports—condensations of the full reports, sold at a cheaper rate. It also sells news to an organization known as the American Press Association, for distribution to papers not members of the Associated Press, with the proviso that the news thus sold is not to be printed for twelve hours after it has been sent over the wires to newspapers receiving the regular service of the Associated Press.

The Associated Press now has about 700 members, more than half of which are afternoon dailies, and serves, under the arrangement with the American Press Association described above, about 2,500 daily and weekly papers in addition. Most of the papers served are in the United States, but there are 50 or more in Canada, Mexico, Cuba, and Porto Rico. In its regular news service the Associated Press now uses 9,345 miles of leased wire by day and 20,467 miles by night.

The annual revenues derived from assessments levied on the newspapers served exceed $1,900,000, and the number of words daily received and transmitted at each of the more important offices is now over 50,000, or the equivalent of 35 columns of an average newspaper.

Among other news-gathering associations now in the field are the Publishers' Press, and the Scripps-McRae Press Association, which work together, the former operating principally in the eastern part of the country, the latter in the western.

The Publishers' Press was started April 8, 1897, the day after the failure of the United Press, to fill the gap left by that association. Unlike the Associated Press, it is not a cooperative organization, but a stock company whose business it is to buy news and sell it again; nor is it, like the Associated Press, under limitations as to the number of papers it may serve in one place. Again, unlike the Associated Press, the Publishers' Press does not receive news from the papers it serves, but has its own correspondents at the various centers where news can be collected. The foreign news of the Publishers' Press is gathered through a main office in London and branch offices in Paris, Berlin, Rome, and other European news centers.

The Publishers' Press controls several thousand miles of wire in the United States—one, which carries news to a Seattle paper, being 3,260 miles long.

Another news-gathering organization, which may be regarded as simply the news-gathering department of the *New York Sun*, is the Laffan News Bureau. This organization has regular correspondents at all news centers, foreign as well as domestic, maintaining, besides, "sleeping correspondents" who are paid in accordance with the news they send in; serves 30 or 40 newspapers in different parts of the country; and maintains, like the other bureaus, a system of leased wires.

Besides the regular press bureaus, some leading newspapers engage in the business of selling news. Among these are the *New York Herald*, the *Chicago Record*, and the Hearst papers. Such arrangements as these can hardly be said, however, to compete with the news service of the Associated Press, which is far in the lead of the news-gathering organizations of the United States.

Newspaper Syndicates.—An extension of the scope of the newspaper, during the last twenty years, to include subjects of more lasting interest, led to the creation and extension of the so-called "syndicate," which furnishes papers with miscellaneous reading matter, as the news-gathering association furnishes them with news. The syndicate was introduced about 1884, for the purchase and sale of stories, but has since extended its field to all sorts of reading matter. While the news-gathering associations are largely cooperativé, the syndicate is purely a proprietary affair, buying articles from authors and selling them outright to the different newspapers on their list of customers.

Some syndicate matter is sent out in matrix form, but most of it is supplied in the shape of galley proof, to be set up in the office of the newspaper purchasing it, in the general style of the paper.

Most of the syndicate material is prepared especially for the Sunday supplement or magazine part of a newspaper, but the syndicates will furnish almost any class of articles found in daily papers. In making sales, the syndicate has a fixed price for articles, and although it disposes of the same stories or other matter to a number of papers, only one in each city or field of publication may receive a given story or article.

The syndicate is enabled, by its sales of the same article to many customers, to purchase matter quite out of the reach of the individual newspaper, and to sell it on terms that each can afford. The scheme is found to be so advantageous that to-day practically all the newspapers of the country, except some in a few of the largest cities, use syndicate matter to a considerable extent.

Besides the firms engaged primarily in the syndicate business, certain leading metropolitan newspapers dispose of their own matter to papers published elsewhere.

In the last decade no important changes have taken place in the syndicate field. The material now supplied may be rather better in quality than that supplied at first, but the business arrangements and the extent of syndicate operations have remained about the same for several years.

THE COOPERATIVE PLAN OF PRINTING PAPERS.

There has been little development, for several decades, of the "patent insides" system described in the special report of the Tenth Census on the Newspaper and Periodical Press. The general advance in printing has led to some progress in methods, and the number of papers served has increased with the growth of the newspaper industry in general, but growth in this line has been relatively slow.

The following table shows, by states and territories arranged geographically, the number of newspapers printed on the cooperative plan:

TABLE 57.—*Newspapers printed on the cooperative plan, by states and territories: 1900.*

STATE OR TERRITORY.	Number of newspapers.
United States	7,749
North Atlantic division	728
New England	177
Maine	13
New Hampshire	30
Vermont	10
Massachusetts	90
Rhode Island	16
Connecticut	18
Southern North Atlantic	551
New York	196
New Jersey	79
Pennsylvania	376
South Atlantic division	511
Northern South Atlantic	185
Delaware	4
Maryland	49
District of Columbia	6
Virginia	62
West Virginia	64
Southern South Atlantic	326
North Carolina	81
South Carolina	51
Georgia	135
Florida	59
North Central division	4,725
Eastern North Central	2,110
Ohio	337
Indiana	358
Illinois	703
Michigan	365
Wisconsin	347
Western North Central	2,615
Minnesota	409
Iowa	619
Missouri	376
North Dakota	122
South Dakota	224
Nebraska	462
Kansas	403
South Central division	1,179
Eastern South Central	476
Kentucky	59
Tennessee	114
Alabama	134
Mississippi	169
Western South Central	703
Louisiana	94
Arkansas	143
Indian Territory	62
Oklahoma	153
Texas	251
Western division	606
Rocky Mountain	285
Montana	32
Idaho	40
Wyoming	20
Colorado	177
New Mexico	16
Basin and Plateau	43
Arizona	4
Utah	35
Nevada	4
Pacific	278
Washington	95
Oregon	65
California	118

It will be seen from this statement that over 60 per cent of the papers printed on the cooperative plan are found in the North Central division. The number in Illinois alone (the highest number for any single state) nearly equals the number shown for the entire North Atlantic division, and Iowa (next in rank) surpasses both the Western and South Atlantic divisions.

Many of the newspapers of this class are the only ones in their respective towns—this being the case with 60 per cent of those sent out by one concern. At the present time most of the newspapers printed in this way are weeklies, and these form about half of the total number of weeklies in the United States. Many semiweeklies and triweeklies, also, are issued in this way, and some dailies adopt the method. These dailies are printed at a distributing center, sent out by express in the morning, and finished at the local office in the afternoon.

Some concerns endeavor to avoid the sameness of appearance in "patent insides" by issuing the material in the form of stereotyped plates ready for printing, instead of in printed sheets. They first send out proof sheets, showing what articles they have on hand, and from these the local editor selects what he chooses. On receiving the plates he cuts them up as he likes, for arrangement in his page, even cutting off the headings and supplying headlines of his own, to secure greater individuality.

The American Press Association, of New York, organized about 1880, controls much of the business in plate matter, and has already been referred to as the association supplied by the Associated Press with telegraphic news for use twelve hours after the regular service. The news received by this association in the morning is set up in plate form, and distributed to some 2,500 dailies for use the same afternoon. This organization serves a large number of newspapers, including many dailies, with electrotype or stereotype plates of miscellaneous matter, and also sells type uniform with that used in making the plates, so that the papers supplied may be made to appear the same throughout.

There appears to be a growing tendency toward the use of plate matter in preference to the half-printed sheets. Country journals are beginning to demand telegraphic news, and this the plate-matter concerns can supply fresher than the "patent insides."

Newspaper Combinations.—By the close of the last decade there was noted a slight tendency toward consolidation, under one ownership or management, of newspapers published in different places. This plan has thus far been adopted only among certain large metropolitan dailies. Examples of common ownership of this general character are shown in the *Galveston News* and the *Dallas News*, essentially the same paper in both cities; the *New York Herald*, the *Evening Telegram* (New York), and the European edition of the *Herald*; the *New York Times* and the *Philadelphia Times;* the *Washington Times* and the *New York Daily News;* and the group of papers owned and published by William R. Hearst—the *San Francisco Examiner*, the *Journal and American* (formerly the *New York Journal*), the *Evening Journal* (New York), and the *Chicago American*. In small places the newspapers are in such close contact with the people they serve that it is a distinct advantage for the proprietor to be personally known to his subscribers, and to be identified exclusively with his locality. In small places not only the reading public but the advertisers seem to prefer newspapers owned and published in the place of circulation. Furthermore, it is only in large cities that the opportunities for economy through combination are great enough to warrant the attempt, practically the same results being secured more easily in country districts by making use of the syndicate and the "patent insides."

TABLE 58.—NEWSPAPERS AND PERIODICALS,

		United States.	Alabama.	Arizona.	Arkansas.	California.	Colorado.
1	Number of establishments	15,305	156	32	217	512	212

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 217. WASHINGTON, D. C. JUNE 30, 1902.

MANUFACTURES.

SLAUGHTERING AND MEAT PACKING.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I transmit herewith, for publication in bulletin form, the statistics of the slaughtering and meat packing industry in the United States for the census year 1900, prepared under my direction by Mr. Harry C. McCarty, of the Census Office.

The statistics included in the report were collected, as at the Eleventh Census in 1890, upon a special schedule. The returns made on this schedule were tabulated under two classifications—Slaughtering, Wholesale, not including Meat Packing; and Slaughtering and Meat Packing, Wholesale. The figures of these two classifications are united in all the tables of this bulletin, except in Tables 5 and 6, which present the figures for the several states, separately for each classification.

Although slaughtering and meat packing has been treated as a manufacturing industry at each census since 1850, it is closely allied with the agricultural features of the raising of live stock.

The statistics are presented in 12 tables. Table 1 shows the growth of the industry for the half century which terminated with the Twelfth Census; Table 2 shows a comparative summary of the industry as between 1890 and 1900 for the several states; Table 3 presents the percentage of capital invested and of value of products for the 13 states leading in value of products in 1900, as compared with the total capital invested and value of products for the United States; Table 4 is a comparative table of the statistics for 1880, 1890, and 1900 of those cities that, in 1900, reported a production to the value of $1,000,000 and over; Table 5 shows the detailed statistics for slaughtering operations as conducted by establishments not engaged in meat packing; Table 6 shows the detailed statistics for the establishments engaged in meat packing, including such slaughtering as was carried on by the packing establishments; Table 7 is a comparative statement between 1890 and 1900 of the quantity and cost of the materials used, with the percentage of increase; Table 8 shows the quantity and value of the products reported in 1890 and 1900, with the percentage of increase; Table 9 shows the detailed statistics of production in these cities showing in 1900 a value of products of $1,000,000 and over. From this table the figures for several cities are omitted, for the reason that their publication would reveal the operations of individual establishments; Table 10 is a statement of live stock imports and exports during the fiscal years from 1890 to 1900, both inclusive, which ended June 30, one month later than the census year; Table 11 presents the statistics of exports and imports of animal products also for the same fiscal years; Table 12 is a detailed summary of the industry as a whole, as it existed at the taking of the Twelfth Census. These tables are supplemented by four small tables, showing the receipts, shipments, and number of live stock slaughtered in Chicago, Kansas City, Omaha, and St. Louis, respectively. A diagram, which shows the relative order of the 12 cities leading in 1900 in value of products, accompanies Table 9.

Owing to changes in the method of taking the census, comparisons between the earlier and later decades, represented in Table 1, should be drawn only in the most general way. The manufacturing statistics of the censuses prior to 1850 were too imperfect and fragmentary in character to make it proper to reproduce them in such a table as a measure of industrial growth in the first half of the century.

In drafting the schedules of inquiry for the census of 1900 care was taken to preserve the basis of comparison with prior censuses. Comparison may be made safely with respect to all the items of inquiry except those relating to capital, salaried officials, clerks, etc., and their salaries, the average number of employees, and the total amount of wages paid. Live capital—that is, cash on hand, bills receivable, unsettled ledger accounts, raw materials, stock in process of manufacture, finished products on hand, and other sundries—was first called for at the census of 1890. No definite attempt was made, prior to the census of 1890, to secure a return of live capital invested.

Changes were made in the inquiries relating to employees and wages in order to eliminate defects found to exist on the form of inquiry adopted in 1890. At the census of 1890 the average number of persons employed during the entire year was called for, and also the average number employed at stated weekly rates of pay, and the average number was computed for the actual time the establishments were reported as being in operation. At the census of 1890 the greatest and least numbers of employees were reported, and also the average number employed during each month of the year. The average number of wage-earners (men, women, and children) employed during the entire year was ascertained by using 12, the number of calendar months, as a divisor into the total of the average numbers reported for each month. This difference in the method of ascertaining the average number of wage-earners during the entire year may have resulted in a variation in the number, and should be considered in making comparisons.

At the census of 1890 the number and salaries of proprietors and firm members actively engaged in the business or in supervision were reported, combined with clerks and other officials. In cases where proprietors and firm members were reported without salaries, the amount that would ordinarily be paid for similar services was estimated. At the census of 1900 only the number of proprietors and firm members actively engaged in the industry or in supervision was ascertained, and no salaries were reported for this class. It is therefore impossible to compare the number and salaries of salaried officials of any character for the two censuses.

Furthermore, the schedules for 1890 included in the wage-earning class overseers, foremen, and superintendents (not general superintendents or managers), while the census of 1900 separates from the wage-earning class such salaried employees as general superintendents, clerks, and salesmen. It is possible and probable that this change in the form of the question has resulted in eliminating from the wage-earners, as reported by the present census, many high-salaried employees included in that group for the census of 1890.

In some instances the number of proprietors and firm members, shown in the accompanying tables, falls short of the number of establishments reported. This is accounted for by the fact that no proprietors or firm members are reported for corporations or cooperative establishments.

The reports show a capital of $189,198,264 invested in this industry. This sum represents the value of land, buildings, machinery, tools, and implements, and the live capital utilized, but does not include the capital stock of any of the establishments conducting business under a corporate form of organization. The value of products is returned at $785,562,433, to produce which involved an outlay of $10,123,247 for salaries of officials, clerks, etc.; $33,457,013 for wages; $24,060,412 for miscellaneous expenses, including rent, taxes, etc.; and $683,583,577 for material used, mill supplies, freight, and fuel. It is not to be assumed, however, that the difference between the aggregate of these sums and the value of the products is, in any sense, indicative of the profits in the manufacture of the products during the census year. The census schedule takes no cognizance of the cost of selling manufactured articles, or of interest on capital invested, or of the mercantile losses incurred in the business, or of depreciation in plant. The value of the product given is the value as obtained or fixed at the shop or factory. This statement is necessary in order to avoid erroneous conclusions from the figures presented.

Very respectfully,

S. N. D. North

Chief Statistician for Manufactures.

SLAUGHTERING AND MEAT PACKING.

By Harry C. McCarty.

The process of converting live stock into food for human consumption is an industry that, directly and indirectly, furnishes employment to a considerable portion of the population of the United States, and sustenance to all. The Census Office recognizes two classifications of this process—one, slaughtering, wholesale, not including meat packing, which involves the preparation of fresh meat; the other, slaughtering and meat packing, wholesale, which comprehends the packing of meat and the preparation of the various other animal products and by-products. Up to the census of 1890 these two branches were reported together under various names, but at that time the classification was subdivided as indicated above. This classification was also adopted at the Twelfth Census in 1900. The figures of these subdivisions are united in Table 1.

Table 1.—COMBINED SLAUGHTERING AND MEAT PACKING: COMPARATIVE SUMMARY, 1850 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

	DATE OF CENSUS.						PER CENT OF INCREASE.				
	1900	1890	1880	1870	1860	1850	1890 to 1900	1880 to 1890	1870 to 1880	1860 to 1870	1850 to 1860

[1] Decrease.
[2] Includes proprietors and firm members, with their salaries; number only reported in 1900, but not included in this table. (See Table 12.)
[3] Not reported separately.
[4] Not reported.

The development of this industry during the half century covered by the table has been almost phenomenal. The settlement of the Western country and the consequent expansion of territory devoted to stock raising; the extension of railroads and the increased facility of communication; the methods devised to insure preservation of meats, such as improved methods of curing, and the introduction and improvement of mechanical and chemical processes of refrigeration, rendering summer packing possible; the utilization of every part of the animal; and the adoption of labor-saving devices, are among the factors that have contributed to its growth. In the fifty years the number of establishments increased from 185 to 921; the capital invested, from $3,482,500 to $189,198,264; the number of wage-earners, from 3,276 to 68,534; the wages paid, from $1,231,536 to $33,457,013; the cost of materials used, from $9,451,096 to $683,583,577; and the value of products, from $11,981,642 to $785,562,433. The average amount of capital invested per establishment grew from $18,824 in 1850 to $205,427 in 1900; the average yearly earnings of the wage-earners grew from $376 to $488; and the average value of products per establishment rose from $64,766 to $852,945. The growth was steady.

During the ten years covered by the Eighth Census, taken in 1860, the center of the meat industry was at Cincinnati and in the Ohio Valley. The average amount of capital invested per establishment increased from $18,824 to $39,221, or 108.4 per cent, while the average value of products per establishment increased from $64,766 to $113,675, or 75.5 per cent. From that time concentration in definite centers was a marked feature of the growth. The effects of the industrial crisis of 1857, with its wholesale reduction of wages, is seen by the difference in the average yearly wage paid in 1850 and 1860. In 1850 it was $376, which decreased to $202 in 1860, a decrease of 46.3 per cent. The winter packing in eight principal Western centers grew from 720,500 hogs in 1850 to 992,310 hogs in 1860.

In the following decade, from 1860 to 1870, a still greater relative growth is shown. The number of establishments increased 509, or 196.5 per cent, the largest increase in this item recorded in the half century. The sum of $14,066,330 was added to the capital invested; 3,308 wage-earners more than formerly found employment, and the benefit to the stock raiser is shown approximately in the increase of $38,109,591, or 161.7 per cent paid for materials used. The value of the product increased $46,384,724, or 157.5 per cent. It should be remembered, however, that these values were expressed in a currency which was at a discount in gold, and should therefore be reduced about one-fifth for purposes of comparison with the other census years. This decade saw the beginning of the dressed-beef trade. The refrigerator car was invented, and in September, 1869, the first cargo of dressed beef was shipped from Chicago to Boston. The capital invested per establishment decreased from $39,221 to $31,543, or 19.6 per cent. This decrease was due principally to the large increase in the number of small establishments. The average value of products per establishment decreased from $113,675 to $98,732, or 13.1 per cent.

The development in the decade from 1870 to 1880 was due primarily to the improvement in various refrigerating processes, and the consequent inauguration of summer packing on a large scale. Up to 1872, in the pork-packing branch of the industry, summer slaughtering and packing had not assumed large proportions, but in the packing year 1872–1873, 505,500 hogs were killed during the summer season. The increase was steady until the summer season of 1879–1880, when 4,051,248 hogs were killed and packed. In 1872–1873 summer packing amounted to 8.5 per cent of the pack for the entire year, while in 1879–1880 it had grown to 37.7 per cent. During the same period, winter packing grew from 5,410,314 hogs in 1872–1873 to 6,950,451 hogs in 1879–1880. Winter packing increased 28.5 per cent, while summer packing increased 701.6 per cent. This latter growth affords an illustration of the influence that refrigeration had on the growth of the meat trade. The yearly pack increased from 5,915,814 hogs in 1872–1873 to 11,001,699 in 1879–1880, or 86 per cent. The dressed-beef trade, too, was given an impetus by the introduction of the refrigerating processes. Up to 1875 this trade had been of minor importance except for local consumption, but with the introduction of the refrigerator car, allowing shipment to markets at a distance from the place of slaughtering, it assumed large proportions. The beginning of the export of fresh beef dates from 1876. The canning of beef was attempted in Chicago in the sixties, and had some growth, but it was not until 1879 that it was taken up on a large scale. The decrease in the number of women employed, and the increase in the number of children, is a noticeable feature. The table shows, however, a large increase in all other items.

In the ninth decade (1880–1890), the capital invested and the wages had very nearly the same growth per cent, although the total amount of wages was a little more than one-fifth the amount of capital invested. The value of products increased $258,049,255, or 85 per cent. The number of establishments increased faster than in the preceding decade. The average amount of the capital invested per establishment increased from $56,673 in 1880 to $104,551 in 1890; the average value of products per establishment increased from $348,122 to $502,336, an increase of 44.3 per cent. This decade is the only one in which the growth per cent of the value of products exceeded the growth per cent of the cost of materials used. This was due to the fact that the packer began to utilize the waste that was formerly thrown away, thus giving an increased value to the product, while the value of the stock, as purchased from the stock raiser, did not increase in corresponding ratio.

In the tenth decade (1890–1900), the progress of concentration went steadily on. In 1900 there were 921 establishments, with an invested capital of $189,198,264, an average capital of $205,427, as against 1,118 establishments in 1890, with a capital of $116,887,504, and an average of $104,551 invested per establishment, or an increase in the individual establishment in the ten years of 96.5 per cent. These figures show this period to be the most rapid in its tendency toward concentration. The more extended use and consequent increased operating expenses of the refrigerator car system, owned by the packers, explains part of the increase in the miscellaneous expenses. In 1890 the miscellaneous expenses were 2.8 per cent of the value of the product, and 3.1 per cent in 1900. The largest percentage of increase appears in the number of women and children employed and the wages paid them. The number of women employed increased 197.5 per cent, and their wages 199 per cent; the number of children employed increased 138.1 per cent, and their wages 176.3 per cent.

A reference to Table 2, showing the comparative summary, by states, is instructive as indicating the geographical location of this industry, and, roughly, its movement during the decade 1890–1900.

TABLE 2.—COMBINED SLAUGHTERING AND MEAT PACKING: COMPARATIVE SUMMARY, BY STATES, 1890 AND 1900.

STATES.	Year.	Number of establishments.	Capital.	Salaried officials, clerks, etc.: Number.	Salaried officials, clerks, etc.: Salaries.	Average number of wage-earners and total wages: Total: Average number.	Total: Wages.	Men, 16 years and over: Average number.	Men, 16 years and over: Wages.	Women, 16 years and over: Average number.	Women, 16 years and over: Wages.	Children, under 16 years: Average number.	Children, under 16 years: Wages.	Miscellaneous expenses.	Cost of materials used.	Value of products.

[1] Included in "All other states."

[2] Includes establishments distributed as follows: 1890—Florida, 2; Georgia, 1; New Hampshire, 2; North Carolina, 1; South Dakota, 2; Vermont, 1; Virginia, 1; Washington, 4; West Virginia, 2; 1900—Alabama, 2; Arkansas, 2; North Carolina, 1; New Hampshire, 1; New Mexico, 2; Oklahoma, 2; South Carolina, 1; South Dakota, 1; Wyoming, 2.

In value of products Illinois was the leading state in both years. As between the two census years it is seen that Kansas advanced from third place to second, New York dropped from second place to fourth, Nebraska advanced from fourth to third, Indiana occupied fifth place in both years, Iowa fell from sixth to eighth, Massachusetts advanced from eighth to seventh, and California from thirteenth to eleventh. The list of the leading 13 states, in their order, in 1890 is as follows: Illinois, New York, Kansas, Nebraska, Indiana, Iowa, Pennsylvania, Massachusetts, Missouri, New Jersey, Ohio, Wisconsin, and California; in 1900 the order was: Illinois, Kansas, Nebraska, New York, Indiana, Missouri, Massachusetts, Iowa, Pennsylvania, Ohio, California, New Jersey, and Wisconsin. The falling off in the value of products in New York and New Jersey is noteworthy. Of these 13 states the greatest gain per cent was made by Nebraska, with 146.3 per cent, followed by Missouri, with 134.9 per cent. During the decade Illinois made by far the greatest absolute gain, $75,630,895, an amount nearly equal to the entire value of products for Kansas, the second state in 1900. In absolute gain, Nebraska, with $42,339,222, held second place; Kansas, with $32,715,806, third; and Missouri, with $24,720,692, fourth; Indiana came next with $15,948,433. In these 5 states the number of establishments decreased from 195 to 163; their capitalization increased by $53,748,944, of which Illinois was credited with $30,422,147, or more than the increase of the other four put together. The products of the leading thirteen states increased $191,355,048, which was 85.4 per cent of the total increase of $223,950,765 reported for the country.

Table 2 shows the expansion that has taken place in this industry in the Middle West. Illinois is far in the lead. This state in 1900 had 6.9 per cent of the establishments, 37.6 per cent of the capital, 40.7 per cent of the wage-earners, paid 42 per cent of the wages, and produced 36.7 per cent of the products. The industry in the Southern states can hardly be said to exist in an industrial sense, except as a so-called "neighborhood" industry. The Northeastern states are coming more and more to rely upon the West as the source of their meat supply. The decline in New York of 25.1 per cent in the value of products, and in New Jersey of 21.1 per cent, shows that the Western dressed meat is supplying much of the demand that was formerly filled by the Eastern dressed article.

In the extreme West the fact that the production of Oregon decreased from $1,978,625 to $1,638,480, or 17.2 per cent, while that of California increased from $9,768,858 to $15,717,712, or 60.9 per cent, is noteworthy. No comparison can be made for the state of Washington, owing to the fact that the figures for 1890 can not be shown without disclosing the operations of individual establishments. The table shows a growth of 65 establishments in Maryland. Minnesota shows a growth of $5,300,124, or 211.1 per cent, in the value of products. Texas reported no establishments in 1890, but in 1900 returned 12 establishments, with a capital invested of $1,232,267, employing 414 wage-earners, who earned $179,505 during the census year, and produced a product valued at $3,904,491. Utah, although reporting an increase of 4 establishments (from 4 to 8), shows a decrease of $91,744, or 16.8 per cent, in the value of products. The progress of concentration is shown in Pennsylvania, where the number of establishments decreased from 242 to 111, or 54.1 per cent. Delaware shows a loss of 1 establishment, but an increase in the value of products from $320,206 to $521,076, an increase of $200,870, or 62.7 per cent. The number of establishments in the District of Columbia decreased from 24 to 7, but the value of products increased $1,352,421, or 157.5 per cent. Connecticut lost 3 establishments and $489,985 in value of products, or 11.8 per cent.

In consulting Table 3 it should be borne in mind that these figures do not represent an actual increase or decrease in amounts, but a change as compared with the figures for the industry for the entire country.

TABLE 3.—COMBINED SLAUGHTERING AND MEAT PACKING: PERCENTAGES OF CAPITAL AND PRODUCTS FOR THIRTEEN STATES LEADING IN 1900 IN VALUE OF PRODUCTS TO TOTAL CAPITAL AND TOTAL VALUE OF PRODUCTS, 1890 AND 1900.

STATES.	PER CENT OF TOTAL CAPITAL OF THE UNITED STATES.		PER CENT OF TOTAL VALUE OF PRODUCTS OF THE UNITED STATES.	
	1890	1900	1890	1900
Illinois	34.9	37.6	37.8	36.7
Kansas	9.5	8.7	8.0	9.9
Nebraska	4.3	8.7	5.2	9.1
New York	10.8	8.1	13.6	7.3
Indiana	4.6	4.7	5.0	5.6
Missouri	4.3	4.2	3.3	5.5
Massachusetts	6.1	6.0	3.6	4.0
Iowa	3.8	3.4	4.2	3.3
Pennsylvania	5.3	3.6	3.9	3.2
Ohio	3.1	2.8	3.0	2.6
California	1.9	2.1	1.7	2.0
New Jersey	1.6	0.8	3.2	1.8
Wisconsin	2.2	2.0	1.8	1.7

This table presents the percentage of capital invested and of value of products in the 13 states leading in value of products in 1890 and 1900, as compared with the totals of these items for the United States. It shows the figures of Table 2 in this regard, expressed to make clearer the relative importance of these states. Illinois gained 2.7 per cent in capital invested, but lost 1.1 per cent in value of products. A large decrease is shown in New York, where the capital invested fell off 2.7 per cent and the products 6.3 per cent. Kansas shows a loss of 0.8 per cent in capital invested, but a gain of 1.9 per cent in value of products. Nebraska shows a gain of 4.4 per cent in capital and 3.9 per cent in value of products. Massachusetts shows a falling off of 0.1 per cent in capital invested, but a gain of 0.4 per cent in value of products. The gain in California indicates a normal and steady growth, due to increase of population and of export demand. Missouri shows a slight loss per cent in capital invested, but a considerable gain in value of products. New Jersey suffered a loss in both items. In connection with this table it should be noticed that although in 1900 Iowa led in the production of hogs, and stood second in the number of cattle raised, it was eighth, as shown by Table 3, in the value of meat products. This indicates the tendency for slaughtering and packing operations to concentrate in well-defined centers, as shown in Table 4.

TABLE 4.—COMBINED SLAUGHTERING AND MEAT PACKING: COMPARATIVE SUMMARY OF CITIES HAVING A PRODUCT VALUED AT OVER $1,000,000, 1880 TO 1900.[1]

CITIES.	Year.	Number of establishments.	Capital.	SALARIED OFFICIALS, CLERKS, ETC.		WAGE-EARNERS.		Miscellaneous expenses.	Cost of materials used.	Value of products.

[1] The following cities, having a product valued at over $1,000,000, are not included in the above table, because in 1900 they had less than 3 establishments, except Patterson, N. J., and Seattle, Wash., which cities, together with those of 1880 and 1890 shown below, are not included because they are no comparative figures. These establishments are distributed as follows: 1890—Cambridge, Mass., 2: Cedar Rapids, Iowa, 1; Chicopee, Mass., 1; Clinton, Iowa, 1; Hammond, Ind., 1; Los Angeles, Cal., 1; Marshalltown, Iowa, 1; Nebraska City, Nebr., 1; New Haven, Conn,, 2; Orange, Conn., 1; Ottumwa, Iowa, 1; Paterson, N. J., 3, Seattle, Wash., 8, Topeka, Kans., 1; Wheeling (and Ohio County), W. Va., 2; Wichita, Kans., 1. 1890—Los Angeles, Cal., 6. 1880—Cambridge, Mass., 5; Wheeling, W. Va., 4; Worcester, Mass., 5.

[2] Includes proprietors and firm members, with their salaries; number only reported in 1900, but not included in this summary.

[3] Not reported separately.

[4] Not reported.

TABLE 4.—COMBINED SLAUGHTERING AND MEAT PACKING: COMPARATIVE SUMMARY OF CITIES HAVING A PRODUCT VALUED AT OVER $1,000,000, 1880 TO 1900[1]—Continued.

[1] The following cities, having a product valued at over $1,000,000, are not included in the above table, because in 1900 they had less than 3 establishments, except Paterson, N. J. and Seattle, Wash., which cities, together with those of 1880 and 1890 shown below, are not included because there are no comparative figures. These establishments are distributed as follows: 1900—Cambridge, Mass., 2; Cedar Rapids, Iowa, 1; Chicopee, Mass., 1; Clinton, Iowa, 1; Hammond, Ind., 1; Los Angeles, Cal., 1; Marshalltown, Iowa, 1; Nebraska City, Nebr., 1; New Haven, Conn., 2; Orange, Conn., 1; Ottumwa, Iowa, 1; Paterson, N. J., 3; Seattle, Wash., 8; Topeka, Kans., 1; Wheeling (and Ohio County), W. Va., 2; Wichita, Kans., 1. 1890—Los Angeles, Cal., 6. 1880—Cambridge, Mass., 5; Wheeling, W. Va., 4; Worcester, Mass., 5.

[2] Not reported separately.

[3] Not reported.

[4] Includes proprietors and firm members, with their salaries; number only reported in 1900, but not included in this summary.

[5] Includes, for 1900, Cudahy, Wis.

[6] Does not include South St. Joseph, Mo., for 1880.

Table 4 is a comparative summary for 1880, 1890, and 1900, of those cities that, in 1900, showed a production to the value of $1,000,000 and over. The product of Chicago alone reached a value of $256,527,949 in 1900, or 32.7 per cent of the total value for the United States; in 1890, this ratio was 36.3 per cent, a net loss during the decade of 3.6 per cent. Chicago's advance in value of products during these ten years was $52,921,547, or 26 per cent. The number of establishments steadily decreased, falling from 70 ir 1880 to 57 in 1890 and 38 in 1900. Kansas City stood second in value of products, in 1900, gaining during the decade, $33,860,579, or 84.8 per cent. Of the total value of products in the United States, Kansas City furnished 9.4 per cent in 1900 and 7.1 per cent in 1890, a gain of 2.3 per cent. Unfortunately the figures upon which to base such a comparison for South Omaha are not available. The industry had no existence there in 1880, and the figures for 1890 were not published separately. The total production for the state of Nebraska for 1890, however, of which South Omaha constituted a part, was $28,941,144, which was exceeded in 1900 by $38,948,605 by South Omaha alone. In 1900 South Omaha produced 8.6 per cent of the total value of the product of the United States.

At the Twelfth Census New York city (boroughs of Manhattan and Bronx) stood fourth in value of products, showing a decrease between 1890 and 1900 of $11,498,918. Brooklyn in the same time fell off $8,960,722. Jersey City and Newark also show a decrease. This was not due to any decrease in the amount of local consumption, but to the growing importance of the western dressed meat in the eastern markets. Boston shows a continuous and steady decrease in the value of products. Baltimore, on the other hand, steadily gained in number of establishments and in value of products. Philadelphia shows a gain from 1880 to 1890, but a decrease from 1890 to 1900. South St. Joseph, Mo., sprang into prominence between 1890 and 1900, and in 1900, with St. Joseph, produced 3.8 per cent of the total value of the product for the United States. The product of St. Louis, Mo., remained about the same. The figures for East St. Louis, Ill., for 1890 were not reported separately, so that no comparison can be made. In the extreme West, San Francisco gained 58.8 per cent in production between 1890 and 1900, while Portland, Oreg., fell off 16.8 per cent in the same period.

This table as a whole indicates a growth of the average establishment. While in many cases a considerable decrease is shown in the number of establishments, yet a large increase is shown in the average capital invested, and in the average value of the product of the single establishment.

The statistics of slaughtering as conducted separately from packing operations was not included in the census returns prior to the taking of the Eleventh Census, in 1890. Tables 5 and 6 should be consulted together, in order to arrive at the relative importance of the two branches for the several states.

[1] Includes establishments distributed as follows: Alabama, 1; Arkansas, 1; New Hampshire, 1; South Dakota, 1; Wyoming, 1.

In connection with these tables, the fact should be noted that in New York, Pennsylvania, and New Jersey, states showing a decrease in value of products for the last decade, the value of products of establishments engaged in slaughtering only considerably exceeded, in 1900, the value of products of the establishments conducting packing operations. On the other hand, in Illinois, Kansas, Nebraska, Missouri, and Indiana, the packing industry led the slaughtering industry by a large margin. The figures are significant. They illustrate the importance of the demand of the market, in the large eastern cities, for fresh meat for local consumption, although a considerable proportion of the meat from eastern establishments is exported. The immense proportion of the western packing trade shows the local demand was inconsiderable as compared with the amounts necessary to supply the demand in other states and foreign countries.

Table 7.—COMBINED SLAUGHTERING AND MEAT PACKING: QUANTITY AND COST OF MATERIALS USED, 1890 AND 1900, WITH PER CENT OF INCREASE.

	1900	1890	Per cent of increase.
Total cost	$683,583,577	$480,962,211	42.1
Beeves slaughtered:			
Number	5,530,911	5,422,044	2.0
Cost	$247,365,812	$193,348,810	27.9
Sheep slaughtered:			
Number	9,190,490	6,178,449	48.8
Cost	$37,137,542	$24,358,179	52.5
Hogs slaughtered:			
Number	30,654,333	22,349,451	37.2
Cost	$278,736,961	$207,228,609	34.5
All other animals slaughtered:			
Cost	$7,916,399	$5,246,661	50.9
Dressed meat:			
Cost	$54,715,496	$25,674,343	113.1
Fuel	$2,747,606	$1,569,396	75.1
Rent of power and heat	$30,946	$25,240	22.6
All other materials, including mill supplies and freight	$54,932,815	$23,510,973	133.6

A comparative summary between 1890 and 1900, of quantities and cost of materials used, is presented in Table 7. The value of "all other animals slaughtered" shows an increase of 50.9 per cent. This item consisted almost wholly of poultry, and affords evidence of the extent to which this phase of slaughtering has increased among the concerns engaged in the slaughtering of cattle, hogs, and sheep. The total for the value of hogs killed amounted to $278,736,961, an increase of 34.5 per cent in the decade. During the same period, the number of hogs killed increased in a greater ratio than their value, showing a decreased value for the single hog. The number of cattle killed increased only 2 per cent, while the cost increased 27.9 per cent. The number of sheep killed increased 48.8 per cent, while the value increased 52.5 per cent, showing an increase in the cost of the single sheep. The value of dressed meat purchased increased from $25,674,343 to $54,715,496, or 113.1 per cent, showing the extent to which establishments engaged in packing only increased. This item is largely a duplication of the value reported of the animals slaughtered. The increase in the cost of fuel of 75.1 per cent was due principally to the more general use and improvement of the cold storage and refrigeratory processes, and the introduction of electric transportation in plants of some of the larger concerns. The increase of 133.6 per cent in the cost of all other materials was caused in part by the cost of materials needed in the more extended utilization of the "waste" materials, and the materials used in box factories, plants for the manufacture of tin cans and cases, etc., the increasing pressure of competition forcing the establishments to manufacture many of the articles previously purchased from outside concerns. This table shows that the cost of cattle per animal increased from $35.66 to $44.72, and the cost of the single sheep from $3.94 to $4.05, while that of the single hog decreased from $9.27 to $9.09.

Table 8 is a comparative summary between 1890 and 1900, of the quantities and value of products, with the percentage of increase.

Table 8.—COMBINED SLAUGHTERING AND MEAT PACKING: QUANTITY AND VALUE OF PRODUCTS, 1890 AND 1900, WITH PER CENT OF INCREASE.

	1900	1890	Per cent of increase.
Total value	$785,562,433	$561,611,668	39.9
Beef, sold fresh:			
Pounds	2,920,458,297	2,708,319,960	7.8
Value	$211,068,934	$152,591,963	38.3
Beef, canned:			
Pounds	112,449,021	133,428,456	[1]15.7
Value	$9,167,531	$8,950,582	2.4
Beef, salted or cured:			
Pounds	137,589,303	576,289,731	[1]76.1
Value	$9,661,834	$23,318,414	[1]58.6
Mutton, sold fresh:			
Pounds	404,183,601	267,353,788	51.2
Value	$32,963,219	$21,998,023	49.8
Pork, sold fresh:			
Pounds	1,223,038,988	1,125,648,541	8.7
Value	$84,019,387	$66,719,585	25.9
Pork, salted:			
Pounds	1,375,524,758	1,264,956,237	8.7
Value	$88,674,016	$77,737,470	14.1
Hams:			
Pounds	787,526,973	529,387,213	48.8
Value	$73,793,012	$48,732,908	51.4
Smoked bacon, sides, and shoulders:			
Pounds	985,722,212	666,229,376	48.0
Value	$74,873,847	$44,664,041	67.6
Sausage, fresh or cured:			
Pounds	292,164,075	149,281,545	95.7
Value	$21,472,413	$9,298,335	130.9
Refined lard:			
Pounds	891,438,417	536,485,829	66.2
Value	$52,620,348	$33,401,563	57.5
Neutral lard:			
Pounds	129,345,282	104,986,465	23.2
Value	$8,588,350	$6,740,246	27.4
Oleomargarine oil:			
Gallons	19,111,120	16,600,652	15.1
Value	$11,482,542	$12,202,117	[1]5.9
Other oils:			
Gallons	8,245,569	4,427,555	86.2
Value	$3,440,358	$3,590,012	[1]4.2
Fertilizers:			
Tons	168,510	115,400	46.0
Value	$3,300,132	$2,343,777	40.8
Hides:			
Number	6,281,952	5,346,919	17.5
Pounds	336,527,907	384,481,326	[1]12.5
Value	$33,925,911	$21,245,782	59.7
Wool:			
Pounds	13,182,146	11,127,851	18.5
Value	$3,335,824	$2,009,133	66.0
All other products, including custom work	$63,174,775	$26,067,717	142.3

[1] Decrease.

Two notable features of this table are the decrease in the quantity and value of the salted and cured beef, and the increase in the value of "all other products," due to the increase in the production and value of the the so-called by-products. Salted beef, while it has decreased both in quantity and in total value, yet has increased in value per pound, as is indicated by the fact that the percentage of value did not fall so fast as did the percentage of quantity produced. The value of "all other products" has increased from $26,067,717 to $63,174,775, or 142.3 per cent. Compared with the rate of increase in the total value of all products of 39.9 per cent, it increased very nearly three and one-half times as fast. Of the increase of $223,950,765 in the value of all products, the increase of $37,107,058 in the value of "all other products" constituted 16.6 per cent, or very nearly one-sixth. The production of beef, sold fresh, is so large as to be almost incomprehensible—2,920,458,297 pounds were produced in 1900, an increase of 212,138,337 pounds, or 7.8 per cent, over 1890. The value of this beef increased in greater proportion, advancing from an average price of 5.6 cents per pound in 1890 to 7.2 cents per pound in 1900, or 28.6 per cent. Of canned beef, 20,979,435 fewer pounds were canned in 1900 than in 1890, while the value increased by $216,949. Beef, salted or cured, suffered a decline in production of 438,700,428 pounds, falling from 576,289,731 pounds to 137,589,303 pounds, or 76.1 per cent. The decrease in value was $13,656,580, or 58.6 per cent. Of mutton sold fresh, there was a gain of 136,829,813 pounds, or 51.2 per cent. The value of the fresh mutton increased $10,965,196, or 49.8 per cent. The quantity of pork sold fresh and of pork salted each increased 8.7 per cent. The values of these items, however, show considerable variation, the value of the fresh pork increasing 25.9 per cent, and of the pork salted 14.1 per cent. Both show an increased value per pound.

The production of hams increased 258,139,760 pounds, or 48.8 per cent, while the increase in value was $25,060,104, or 51.4 per cent. The production of smoked bacon, sides, and shoulders increased 48 per cent, and the value 67.6 per cent. In 1900 both the production of these and their value exceeded the production and value of hams. The production of sausage, fresh and cured, almost doubled in quantity during the decade, increasing 95.7 per cent, while the gain in value was 130.9 per cent. The quantity of both refined and neutral lard shows a large percentage of increase, indicating, when compared with the production of fresh and salt pork, that a greater portion of the carcass was being devoted to lard than formerly. This is due probably to the fact that lard is considered one of the most valuable products of the hog. The production of oleo oil increased 15.1 per cent in quantity, but fell 5.9 per cent in value. While this decrease in value was largely due to increased production, caused by improved methods of production, yet it is not possible to ascribe the whole decrease to this fact, since the price of this oil is fixed in Rotterdam, the greatest oleo market in the world, where American oleo oil is brought into competition with that from Germany, the Netherlands, and other nations. Under "other oils" the production increased 86.2 per cent, while the value fell 4.2 per cent. The value of fertilizers also fell, while the quantity of production increased. The number of hides increased, although their total weight fell off, showing a decrease in the weight of the average hide, while their value increased 59.7 per cent. The value of the wool increased in a much larger proportion than did the quantity, the value increasing 66 per cent and the quantity 18.5 per cent. This product of 13,182,146 pounds of pulled wool amounted to 35.6 per cent of the 37,000,000 pounds of pulled wool produced in the United States during the calendar year of 1900, as estimated by the National Association of Wool Manufacturers.

Table 9 is interesting in showing the extent to which this industry has tended to group itself about certain centers, and the relative importance of these centers.

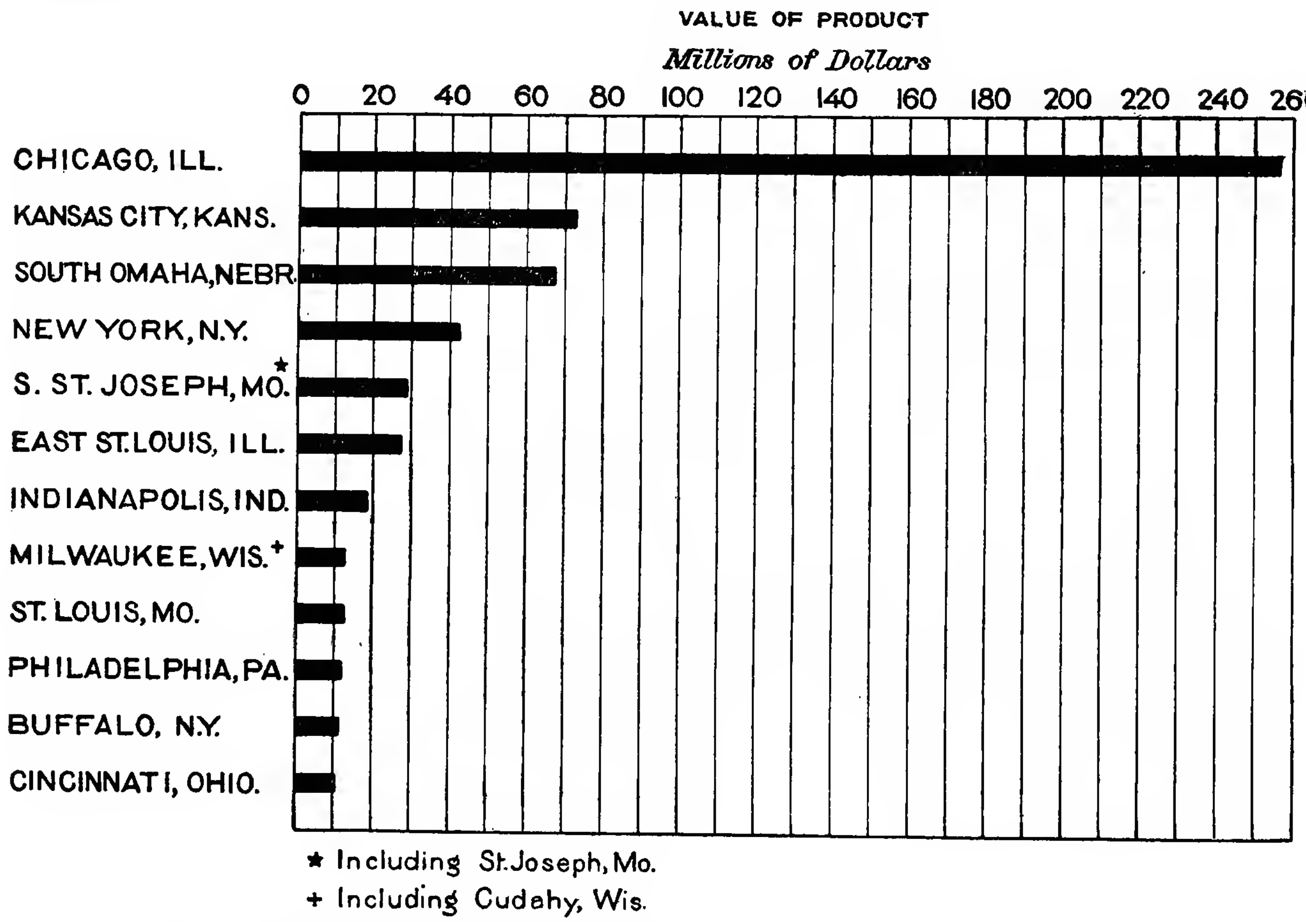
All other products, including custom work	$453,690	$334,534	$1,064,122	$108,605	$21,917	$1,164,645	$2,103,407	$97,412

Chicago led in value of products, as is shown in the diagram accompanying the table. After Chicago came Kansas City, then South Omaha, New York city, St. Joseph and South St. Joseph, Mo., East St. Louis, Indianapolis, Milwaukee and Cudahy, Wis., St. Louis, Philadelphia, Buffalo, and Cincinnati, in the order named. The relative importance of these cities, in the value of products, is shown in the following diagram:



In number of establishments Baltimore ranked first, with 73 establishments, followed by Philadelphia with 58, and New York city with 52, while Chicago, with 38, stood fourth. In the order of capital invested, wages paid, and number of wage-earners, the relative rank of the cities followed closely the same rank as under the value of production. The widest variations occurred in the average amount of capital invested and average value of product per establishment in the different cities. South Omaha had the largest average single establishment, with an average investment of $2,609,570, Kansas City's average capitalization per establishment was $1,889,325; Chicago's, $1,766,788; South St. Joseph's (with St. Joseph), $1,040,180. In the average value of products per establishment, South Omaha led with $11,314,958; Kansas City had $9,223,471; Chicago,

$6,750,736; and South St. Joseph (with St. Joseph), $5,940,995.

Table 10 presents the statistics of exports of live stock, and Table 11 the figures for the exports of meat products, as shown by the tables of the Bureau of Statistics for the fiscal years from 1890 to 1900, both inclusive. A comparison of Table 11 with Table 8, on page 22, shows the proportion of the total product that is sent abroad.

HISTORICAL AND DESCRIPTIVE.[1]

The year 1493 witnessed the first importation of cattle to America, when it is said Columbus brought cattle, sheep, and hogs with him on his second voyage. The Portuguese took cattle to Newfoundland and Nova Scotia in 1553, where they increased rapidly.[2] Black cattle, swine, and sheep were introduced into Florida about 1565, and neat cattle into Canada by the French in 1608. In 1609 the English colony at Jamestown possessed between 500 and 600 hogs and some sheep. They were killed or carried off by the natives or eaten by the colonists in their destitution. Sir Ralph Lane brought cattle from the West Indies to Virginia in 1610, the slaughter of which was forbidden on pain of death. In 1611 Sir Thomas Gates arrived with a hundred or more cows and some swine. To this stock were added in 1613 a few obtained by a raid on the French settlements in Arcadia. In 1620 the cattle had increased to 500 and in 1649 to 20,000. They were early exported to New England, and many were killed to supply the

shipping from London, Bristol, Holland, and New England. By 1656 the sale of beef, pork, and bacon to the shipping and to the West Indies was a source of much profit.

In New England the first neat cattle, consisting of three heifers and a bull, were introduced into the Plymouth Colony by Edward Winslow in the spring of 1624. The number grew to about 200 in 1629.[1]

From that time cattle increased rapidly in number and rose in value. During the Indian wars live stock was a precarious property, but nevertheless continued to increase and furnished articles for exportation. The continued arrival of new settlers kept up the demand for cattle and maintained their price at from £20 to £30 a head. Their number increased rapidly, but they were too valuable for slaughter. As emigration decreased, stock was well diffused through New England, and the colonists became consumers and exporters of beef in considerable quantity. The West India Company imported domestic cattle for breeding into New Netherlands in 1625. In 1678, 400 cattle were killed in the city of New York, and in 1694 the number reached nearly 4,000.[2] Stock raising and the production of beef for the New York and Philadelphia markets, furnished a profitable industry for the settlers in New Jersey. In 1627 the Swedes were supplied with neat cattle by the Swedish West India Company.[3] In 1697 an Englishman, residing in Pennsylvania, stated that 20 fat bullocks besides many sheep, calves, and hogs were killed each week in Philadelphia, even in midsummer. A fat cow could be bought for £3 and salted beef and pork were regularly exported.[4] Before the Revolution great numbers of cattle were raised in Georgia, North Carolina, and South Carolina. They were raised at small cost, being allowed to run wild in the woods. Many farmers owned from 500 to 1,500 head each. Little beef was exported. The cattle were sold in the lean state and driven to Pennsylvania where they were fattened for market.[4]

The cattle of the Northern colonies were fewer in number, but owing to the severe climate received more attention, and greater care was bestowed in the selection of animals for breeding. On the frontier stock raising was an important factor, the cattle furnishing food and other necessities for the rough life of the pioneer. These herds of the colonies, with those brought to Spanish America, were the chief progenitors of the American cattle of to-day. Cattle raising followed the settlement of the country, and crossed the Alleghenies with the pioneers into the fertile valley of the Ohio.

The rise of slaughtering, and packing of meat in the United States as a distinct industry, dates back to 1818, when a packer is reported as conducting packing operations at Cincinnati. Slaughtering operations at Chicago began in 1823, but packing was not instituted until 1827. In that year a Chicago establishment packed some pork for a firm in Detroit, but the packing statistics of Chicago were of small account until 1850. It is said that 9,600 hogs were packed there in 1834, but it was not until 1861–62 that Chicago attained preeminence as a packing center. In the winter season of 1832–33, there were several establishments at Cincinnati, and in that season it is claimed that 85,000 hogs were slaughtered there. The development of the agricultural resources of the Ohio Valley cheapened the cost of raising stock, and the demands of the Southern and Eastern markets caused an increased production, particularly of hogs. These facilities for stock raising naturally caused the inauguration of packing operations, and small plants sprang up in the more important towns. At first these centers were confined closely to the towns upon the rivers, owing to the greater facility of transportation by water.

In those days the packing was confined almost exclusively to the curing and packing of hog products. Much of the slaughtering was done by farmers in the winter, who, after supplying their own demands, sold the remainder of the carcass to some neighboring storekeeper or small packer, who, in turn, cured the carcass for market. Curing operations were sometimes conducted on flatboats that floated down the rivers after the spring breakup to the larger cities on the Mississippi, particularly New Orleans, where the cured product was exchanged for sugar, molasses, rice, and other products of the Southern states. A large proportion of the pork, hams, etc., reaching New Orleans, was shipped to Baltimore, Philadelphia, New York, Boston, and other cities along the Atlantic coast. Cincinnati at this time was the chief center of the packing industry, owing to its location in the stock-raising region, and to its superior banking facilities, for the packing industry demanded that large sums be paid in ready cash. Again, it was often necessary to employ large gangs of laborers and coopers at short notice, thus making the location of a packing plant most advantageous where these demands could be most readily supplied. The necessities of the trade also demanded an ample supply of salt, and this could be obtained readily only at Cincinnati. An added advantage was found in the denser population that afforded a market for the surplus product. In 1844 there were 26 packing houses at Cincinnati; in 1853–54 the number had increased to 41, and in 1855–56, was 42. A large packing plant had been established at Louisville, Ky., prior to 1844. Other important packing places during the period were Columbus, Chillicothe, Circleville, and Hamilton, in

Ohio; Lafayette, Lawrenceburg, Madison, Terre Haute, and Vincennes, in Indiana; Alton, Beardstown, Pekin, Peoria, and Quincy, in Illinois, and many places of lesser importance.[1] The volume of packing at Cincinnati during the decade prior to 1851–52 was 27 per cent of the total for the West. Cincinnati slaughtered 475,000 hogs in the packing year 1848–49. As settlement moved westward, the extension of the cornfields gave an impetus to stock raising, and the Western cities assumed increasing importance as slaughtering and packing centers.

About 20,000 hogs were killed at Chicago in 1850–51, and from that time the amount of business done in Chicago increased rapidly. The early fifties saw the beginning of railroad operations in the West. Naturally, this had a great influence on the packing business, and to this cause much of Chicago's prominence as a packing center may be traced. Up to this time St. Louis was unimportant as a packing center, and other prominent packing cities of to-day, such as Kansas City, South Omaha, and South St. Joseph, were unknown to the packing world. These cities did not assume importance until later. Cincinnati was the leading packing center in the United States until 1861–62, when Chicago took the lead, which it has retained. With its $256,527,949 worth of products during the census year of 1900, the city of Chicago stands as the chief center of the slaughtering and meat-packing industry of the United States. The preparation of animal food products at this point has come to be one of the greatest industrial and commercial enterprises that has been evolved by the American people. This has not been due to accident nor wholly to the alert and businesslike qualities of her citizens. It has been chiefly because of Chicago's location. Nature located Chicago. As early as 1673, Joliet saw that if a canal were cut through half a league of prairie, boats could pass from the lake of Illinois (Lake Michigan) into the St. Louis River (the Illinois, including the Des Plaines). A city possessing such a location, between the lakes and the great West, was naturally early seen to be a gateway of commerce, and Chicago became the center for the vast systems of transportation that converge there to-day and that include more than one-half of the railroad systems of the United States. The Union Stock Yards was founded in 1865, when 320 acres of land were purchased, and the yard opened in December, 1865. This plant is now worth at least $10,000,000, and on the square mile of land upon which the yards are located are the slaughtering and packing houses that, in 1900, reported a capital invested of over $67,000,000. More than 50,000 men found employment in and about the stock yards in 1900, in the packing establishments, and in the service necessary to the handling of the stock. Within the stock yards are 200 acres of yardage, 20 miles of street, 20 miles of water troughs, 75 miles of drainage and water pipes, and 150 miles of railroad track, which is the property of the stock-yards company, which also owns and operates the locomotives. The table below shows the number of cattle, hogs, and sheep, received, shipped, and slaughtered at Chicago, from 1870 to 1900, inclusive.

[1] Compiled from data furnished by Cincinnati Price Current.

With the development of the country west of the Mississippi, St. Louis took its rise as a packing center. Covered with corn fields, the territory adjoining St. Louis is devoted largely to the live-stock industry, particularly the rising of hogs. The following table shows the growth of the slaughtering industry at St. Louis:

LIVE STOCK RECEIVED, SHIPPED, AND SLAUGHTERED IN ST. LOUIS, MO.: 1868 TO 1900.[1]

[1] Compiled from data furnished by Cincinnati Price Current.

Up to 1870 slaughtering at Kansas City was of relatively small importance. Cattle were driven overland from the Southwest, the journey often consuming as much as three months. At Kansas City they were loaded on cars for shipment to Eastern markets or driven overland to markets in the interior. In 1870 the Kansas City stock yards had their inception in a movement to afford better facilities for handling live stock at that point. As far back as 1873, three small packing houses were located at Kansas City, and in 1875, 48,492 cattle, 47,560 hogs, and 7,585 sheep were slaughtered there. In 1886, of the total number of animals received, 24.6 per cent of the cattle, 76.2 per cent of the hogs, and 51.8 per cent of the sheep were slaughtered; in 1900 these figures had grown to 56.7 per cent for cattle, 92.8 per cent for hogs, and 75.2 per cent for sheep. The stock yards are situated close to the business center of the city and occupy about 200 acres. The following figures show the number of animals slaughtered at Kansas City each year from 1875 to 1900, inclusive:

LIVE STOCK RECEIVED, SHIPPED, AND SLAUGHTERED IN KANSAS CITY, MO.: 1875 TO 1900.[1]

YEARS.	HOGS.			CATTLE.			SHEEP.		
	Received.	Shipped.	Slaughtered.	Received.	Shipped.	Slaughtered.	Received.	Shipped.	Slaughtered.

[1] Compiled from data furnished by Cincinnati Price Current.

[2] Previous to 1897 the movement represents years ending with November.

The prominence that has been attained by South St. Joseph, Mo., in the slaughtering and packing industry was the result of a remarkable development between 1897 and 1900. The receipts at South St. Joseph for 1898, 1899, and 1900 were as follows:

YEARS.	Cattle.	Hogs.	Sheep.
1898	232,074	1,034,035	121,407
1899	294,950	1,401,794	258,432
1900	390,361	1,678,521	390,308

About eighty years ago, when packing was begun at Cincinnati, and even until the late sixties, packing was confined to the curing and salting of pork products and some barreling of beef. The barreling of beef was carried on in the West to a considerable extent and the products sent to the Eastern markets. Beef barreled in the Eastern cities was sent all over the world on board ship. The development in the packing of beef on a large scale has been due to the adoption of the various systems of artificial refrigeration within the last thirty years. No other one factor has had so much influence upon the meat industry. All meat curing depends for its success upon thorough chilling, properly conducted, of the carcass. Artificial refrigeration has practically lengthened the packing year from four months to twelve months, by rendering summer slaughtering possible. The importance of artificial refrigeration to the meat trade would be hard to overestimate. The most important step in the development of American beef as an article of commerce, was the invention of the refrigerator car by William Davis of Detroit. The patents were issued in 1868, and in September, 1869, the first cargo of fresh beef was shipped from Chicago to Boston. This was the commencement of a great industry in the United States, and the initial step toward the foreign trade. The cars now used by the great meat packers of the West are founded on the Davis patent of 1868.[1]

[1] Ice and Refrigeration, September, 1901, Vol. 21, No. 3, page 98.

The object of chilling and freezing meat is not only that it shall be preserved, but also that it be so frozen that it can be thawed, fresh and sweet, with its nutritive qualities intact. To attain this end, the problem is to chill the meat without driving the animal heat inward and thereby causing decay of the marrow and bone. With proper treatment in freezing, however, the quality of the meat need not be impaired. For fifteen to eighteen hours the temperature of the meat is kept at 36° F., and it is then chilled or refrigerated for twenty-four to thirty hours.

The canning of beef was attempted in Chicago in the sixties and enjoyed some growth, but the packers did not take it up on a large scale until 1879. Of late years the production of canned beef has fallen from 133,428,456 pounds in 1890 to 123,249,021 pounds in 1900, and the exports from 82,638,507 pounds in 1890 to 55,553,745 pounds in 1900.

Prior to 1875 the dressed beef trade was not of much importance. The invention of the refrigerator car and its improvement gave a great impetus to the industry. The exportation of fresh beef began in 1876 in a small way. In the early days of cattle raising in the West they were brought East on the hoof and slaughtered in local abattoirs. The journey of 1,500 to 2,000 miles East affected the physical condition of the animal to the extent that it caused the quality of the beef to deteriorate. The adoption of the refrigerator car made it possible to slaughter these cattle in the West, and the Western packers were quick to fill the demand created for the slaughter of these cattle, and ship the product East, thus preserving all the good qualities of the beef. To-day the Western packer competes with the local producer in the Eastern market, and his beef is in far better condition than when it came East on the hoof to be slaughtered at the end of a long, tiresome journey.

Until within comparatively late years little attempt was made to utilize the waste products of the abattoir. The blood was allowed to drain away, and the disposal of heads, feet, tankage, and other waste material was a source of expense, men being hired to cart it away and bury it. After a time industries grew up in the vicinity of the slaughtering establishments, using as their raw materials the waste product of the abattoir. Glue, tallow, soap, and fertilizers were among the articles so produced from the waste. With increasing competition the packing house gradually absorbed these industries, until the utilization of "waste" materials constituted a source of no little profit. The aim is that nothing shall be wasted. The large packing houses utilize the horns, hoofs, bones, sinews, hide trimmings, and the other so-called waste materials. From these are manufactured glue, gelatin, brewers' isinglass, curled hair, bristles, wool felt, hair felt, laundry soap and soap powders, toilet soaps, glycerin, anhydrous ammonia, fertilizers, dried blood (after the albumen is extracted), bone meal, cut bones, poultry food, albumen, neat's-foot oil, pepsin, knife handles, and many other things. Each large establishment has its chemical laboratory, where expert chemists are constantly seeking for new combinations to render more valuable and extensive the already long list of by-products.

It is obvious to even the most casual observer, that an industry putting out a product in a single year of over $785,000,000 is of the utmost importance to the people of the United States. It is essentially Western in its location and growth. The largest establishments are located in the Mississippi Valley. The states leading in the production of live stock for slaughter are west of the Mississippi. Indeed, a large part of the industrial welfare of the West may be said to be based upon the live-stock industry. The territory devoted to the raising of hogs on a large scale is coextensive with the corn belt. The corn crop, the hay crop, and the grasses take on an added value when converted into the form of meat products. The corn crop is the foundation upon which depends the live-stock industry, and this industry is coming more and more to be a question of corn supply. Sheep raising is confined chiefly to the upper Rocky Mountain states, owing to the fact that the successful raising of sheep depends upon the availability of pasturage. From this western stock-raising territory, the movement is northward and eastward to Chicago, Kansas City, South Omaha, St. Louis, South St. Joseph, and the other great slaughtering centers. The geographical movement of the slaughtering and packing area furnishes a view of the settlement and development of the West.

The advantages of the transportation facilities possessed by Chicago, backed with the wide area devoted to stock raising, spreading westward from Lake Michigan to the Rocky Mountains, give that city the lead in this industry. The tendency, however, is for the slaughtering centers to move still nearer the corn belt. The rise within recent years of Kansas City and South Omaha, and more lately of South St. Joseph, may be traced directly to this factor, and to the improved railroad facilities that followed any enlargement of the territory devoted to corn production. Within recent years, overpasturage on many of the Western grazing lands has caused the number of cattle to decrease. Increasing attention devoted to sheep raising, too, has caused a crowding of the cattle, and settlers have been crowding in and fencing the ranges. The place of the large herds that formerly ranged the plains during the entire year is being taken by the small herds that range the free grazing lands in the summer and are carefully pastured and fed during the winter. A loss of one-third of the herd from exposure was a common thing under the old conditions, but under the new system this element of loss is almost wholly removed. Greater attention is being paid to breeding, and almost fabulous prices have been paid for high-class animals for breeding purposes. Another comparatively new development is the extension of the feeding or fattening operations for market. The conversion of the surplus corn into beef, pork, and mutton, yields a large profit to the feeder. Poor-grade stock is bought in the fall, fattened during the winter, and later is sent back to market to be sold at a considerable advance.

The Union Stock Yards at Chicago present a monument to the opportunity and good business sense of the American people. To the stranger entering the yards for the first time, the scene is novel. He enters the main entrance beneath an iron arch bearing an inscription that informs him that the territory within is the "Union Stock Yards, chartered 1865." Once within, factories, pens, and viaducts surround him on every side. Noise and confusion reign everywhere, but the apparent confusion is well ordered; and, considering the immense number of animals that are constantly being handled, the wonder is that they are handled with so much facility. On every hand is heard the "hi-yah" of the drovers and the deep lowing of the cattle. Everywhere is movement.

The stock arrives at the yard in the night or early morning, often after a long, hard ride of hundreds of miles. The company owning the stock yards owns also the transportation facilities within the yards, and, as the animals come in, they are given into charge of the company, which become responsible for both the cargo and the freight, attending to all matters of ownership, consignment, and fees. The company remains responsible for the stock until all charges are paid and the stock delivered to the broker or buyer. The live-stock broker has become a necessity; he is the medium of understanding between the buyer and the seller, and by him all difficulties are adjusted. Through him the seller knows exactly what it will cost to have his stock shipped, fed, watered, and sold. As soon as possible after the arrival at the yard, the herds are driven to pens, fed, and watered, and after that the selling begins. Owners, buyers, sellers, agents of the packing houses, and commission men mingle in the excitement of the market. The examination and weighing of the animals follow the sale. An official statement of the weight is given the seller. The animals are then driven to the slaughterhouse. The worry and exhaustion of the cattle, occasioned by the long ride, have heated them so much that a period, generally of about twenty-four hours, is given to allow their temperature to cool to the normal point. Hogs, however, are not allowed this respite, but are sprinkled and immediately driven to a large solid wheel, with chains fastened at intervals along the rim. With these chains the hog is shackled by one hind leg. The wheel revolves, slowly raising the squealing porker. As he gets near the top, the hog is detached automatically from the wheel, and a hook attached to a sloping rail carries the victim to the butcher. With a swift motion, almost mechanical because of its long practice, the throat is cut lengthways, and the carcass is run along a short distance to allow the blood to drain out, which is drawn off and used largely in the manufacture of fertilizers. After a short time has been allowed for this draining, the carcass is plunged into a bath of scalding water. It is then brought automatically to a table, across which it is dragged through a scraping machine by an endless chain. This machine does the work better than it could be done by hand, leaving the bristles in much better condition. It does its work very thoroughly, its blades being mounted on cylinders coming in contact with every part of the body. To insure perfect results, the body is then gone over by hand scrapers, after which the carcass is thoroughly washed with a hose. Next the head is nearly severed, the gambrels are cut, and the body suspended by them from the rail.

The body is then opened and dressed, the leaf lard is removed, the head is taken off, the tongue removed, and, lastly, the body is split in two. All this is done at the rate of 20 hogs per minute. Thence the two halves go to the chill room, where they remain about twenty-four hours, until after the animal heat has left the body and it is thoroughly chilled. After this the sides are run to the cutting tables. In the cutting, too, many changes have taken place since the early days. Formerly the only cuts were hams, sides, shoulders, and cuts for barreled pork. In this connection Mr. Philip D. Armour said: "To-day (1895) the variety of cuts is bewildering to an outsider. The world to-day is the packer's market, and he has to study the peculiarities and preferences of each country, and even each county. The idiosyncrasies in the cutting and curing of home-killed bacon is reflected to-day in our cuts. Wiltshires, Cumberlands, Staffordshires, Yorkshires, etc., are only a few of such distinguishing styles."[1] A hog dresses about 80 per cent of its live weight, about 20 per cent being offal. Fresh meat comprises about 10 per cent of the dressed hog, and the other 90 per cent is cured. From the cutting room the various parts intended for curing are sent by chutes to the curing rooms, where some cuts lie for at least sixty days in dry salt, and the shoulders, sides, hams, etc., intended for smoking lie for a like period in vats of sweet pickle. After these pieces intended for smoking have lain in pickle for five to eight weeks (the time required and the strength of the pickle varying according to the size of the cut), they are removed to the soaking tank and soaked for about twenty-four hours, in order that the heavier salting toward the surface of the cut may be brought to a uniformity with the center. From here the hams go to the trimming table, whence they are taken to the smokehouse, where they are smoked for about twenty-four hours. They then go to the storeroom, or the department where the hams and bacon are branded and labeled, and some are covered with canvas.

The manufacture of sausage brings to the packer greater profit for the amount of meat used than any other part of the hog. Sausage is made of trimmings which are the remnants of everything. Material for sausage comes from the ham-trimming department, from the butcher's bench at the market stall, from the killing room, and from the beef houses, particularly where the heads and hoofs are trimmed. The meat is chopped, mixed, and stuffed by machinery. The spices, such as sage, pepper, salt, ginger, and mustard, are mixed with the meat prior to its passage through the chopping machine, in order that it may be more thoroughly mixed. The ginger and mustard are added to counteract the action of the fatty greases on the stomach. From the chopping table the meat goes to a mixing trough to be mixed with large quantities of water necessary to make the mass sufficiently pliable that the casings may be filled with little difficulty. Here potato flour is also added to give consistency to the material. At this point the constituent parts are 40 per cent meat and spice, 40 per cent potato flour, and 20 per cent water. The potato meal neutralizes the taste of the pork, and the spices keep the stomach right.

The intestines, from which the casings are made, are one of the most valuable products of the hog. The labor involved in preparing them for commercial use is much greater than that demanded in the preparation of any other part of the hog. In some packing houses the old plan of doing the work entirely by hand, cleaning the intestines by turning them inside out and scraping with knife blades, still obtains, but in all the larger houses this work is done by a machine of marvelous rapidity, and it does its work more thoroughly than is possible by hand. Stuffing is done by a machine composed of two large cylinders, one a steam cylinder, the other a sausage-stuffing cylinder, and a piston rod directly connected with the piston rod of the large cylinder. The steam cylinder is of such an area that with 80 pounds steam pressure we have 190 pounds of pressure to the square inch in the stuffing cylinder. This causes sufficient pressure to force the sausage from

[1] One Hundred Years of American Commerce, Vol. II, page 386.

the small orifice at the bottom of the cylinder, to which is attached a tube over which the sausage casings are slipped, and the pressure when the cylinder is filled is sufficient to fill the skins at a speed of a mile a minute. From this machine the sausages are delivered at a table at which stand several men who tie them in links. This process done, the sausage is ready for marketing.

Lard is another important product of the hog. The packer divides it into two kinds—leaf lard and steam lard. Leaf lard comes from the surplus fat that accumulates in the hog, incased in a skin somewhat similar to that inclosing the intestines, only of frailer fabric. From the hog this leaf is washed and then goes to the rendering kettle. The leaf is cut into strips about three inches wide which is again cut into squares about three inches long. This cutting has to be done with much care, for mangling the leaf is detrimental to the production of good lard. The kettle is generally an open-jacketed one with a space for steam between the two parts of the kettle. A heavy shaft suspended through the kettle horizontally has arms attached which pass close to the bottom. This shaft in revolving keeps the mass in constant motion. This kettle holds about 10 tierces, and is kept constantly full, the steam being turned on in the jacketed space at a pressure of about 15 pounds and a temperature of about 222° F. The water taken on in washing the leaf first arises as vapor, and continues to vaporize as long as any water is left. After a time the surface begins to sink, showing that some of the leaf has melted, and the shaft and stirrers are started and the temperature is raised to about 250° F. Cut leaf is added from time to time to keep the kettle full, so that it is full of lard to the brim when the rendering is completed. After about five hours the cooking is finished, and the steam is turned off. A small amount of salt is thrown into the kettle, and after an hour of settling the lard is drawn off from the bottom through an opening over which there is a fine screen of wire cloth. From here the lard is run to an open tank where it cools to a temperature of 160° F., when it is drawn into tin pails of about 20 quarts each, and from these filled into packages of wood or tin, and placed in a room where a blast of air of a temperature of about 40° to 45° is blown over it. The rapid cooling causes a shrinkage on the surface and gives a crinkled effect that was formerly believed to be an indication of its purity. The color of leaf lard is creamy. Nearly everything to-day enters into leaf lard from leaf to belly trimmings. Much leaf lard is made into neutral oil. This oil is free from animal smell and taste.

Stock for making steam lard comes from all sources and every grade of hog products, from the feet trimmings, or feet themselves, to the skull or head bones. The rendering is done in tight iron cylinders from 30 to 72 inches in diameter and from 6 to 16 feet deep, generally suspended through one floor with a discharge at the bottom of about 12 inches in diameter, and an inle opening on the top of about 16 inches in diameter. Both these openings are covered. The pressure of steam used varies. After the rendering is completed and the steam pressure removed, the tank is allowed to settle. The refuse, such as bones and flesh tissue, sinks to the bottom of the tank, and is used in making fertilizers; above appears a layer of water, and above this, in turn, is the lard. The lard is drawn off into large steam jacketed kettles holding 20 to 30 tierces each. These kettles are then heated to above the boiling point of water. This is the refining process, and is continued until the water in the lard ceases to rise as vapor from the kettle. As soon as the water is evaporated the lard settles and is pumped into a large cooler before it is prepared for shipment. The failure to remove all the water in this process of refining is the cause of rancid or spoiled lard.

In the manufacture of fertilizers it is a serious question to reduce the offensiveness of the odor arising from the gases to the smallest possible degree. The odors penetrate every crack and corner, and leave their characteristic taste and smell everywhere. For this reason the building in which the fertilizer operations are conducted is situated at a distance from the other buildings of the plant. The material from which fertilizer is made is derived from various sources, chiefly from the rendering and cooking tanks. Fertilizer is a compound, and contains large amounts of ammonia and nitrates, and its value depends upon the amount of these constituents. Fertilizer material is generally cooked on the top floor of the building, and after being thoroughly cooked it is passed through a drying press. The material is pressed in order to reduce the water and save steam in drying, and to secure any grease possible, which adds nothing to the fertilizing properties. The drying presses are usually square boxes, about 16 inches long, 12 inches wide, and 3 inches deep, and are operated either by hydraulic power or by a screw press. After pressing, a rapid drying is given the material at a temperature of over 260° F., a revolving rapidly being necessary to prevent burning. Several different kinds of drying machines are in use. After drying, the fertilizer is put in bags, in which condition it is shipped to the manufacturer of fertilizer compounds.

In killing cattle, a day is generally allowed them to recover their normal temperature after the excitements of their journey. After they have cooled, the cattle are driven up an incline to the top of a 4 or 5 story building, into a long, narrow lane of a width sufficient to allow only two cattle to stand abreast. As the two animals in the lead reach the end of the lane, a partition is lowered behind them. This process is repeated for the next pair, and so on to the end of the lane. As soon as the line is secured, a man wielding a heavy hammer traverses a platform that runs along outside near the top of the lane, and with a swinging blow, which strikes the animal between and above the eyes, fells the cattle. The side of the lane is then raised, the floor of the lane tilted, and the carcasses are precipitated upon the slaughtering floor. Next the body is shackled by the hind legs, hoisted and hooked to a rail, along which it slides to the butcher, who, with a quick thrust, severs the large vein of the neck. A pan is quickly shoved in to collect the blood, and the floor is arranged so that whatever quantity of the blood may escape the pan is drained into a large tank. Next the carcass is headed, lowered to the floor, and adjusted in such manner that the hide may be removed most easily. In this operation, in the larger establishments, the division of labor is carried to a high degree. Each workman engaged in removing the hide cuts only a certain portion, and the amount done by each is surprisingly small, but this is compensated for in the additional quickness with which the work is accomplished. Next the beef is sent to the chill room, where it is refrigerated about forty-eight hours, when that which is intended for sale as fresh meat is run to the loading platforms, divided into fore and hind quarters, and loaded into refrigerator cars for shipment to all points of the United States and to foreign countries. The killing of sheep differs little from the killing of cattle.

The meat used in canning is generally cow beef, and of an inferior grade. It is cooked in huge kettles and is handled with pitchforks. As soon as cooked, it is pressed into cans, which are capped, soldered, sealed, and inspected by steaming to ascertain if any air holes remain. These holes are closed, and the cans are washed, painted, and labeled, when they are ready for shipment to any climate, since, being airtight, they are proof against climatic changes.

Not the least interesting features of the large packing house are the auxiliary plants that have grown up, such as the tin shop where the cans are made, the box factory where boxes for shipment are manufactured, and the car shops where the refrigerator cars are built and repaired.

MEAT INSPECTION.

The reputation of American meats in the markets of the world depends upon the care and thoroughness with which the meat is inspected. This inspection is conducted by the Bureau of Animal Industry of the Department of Agriculture, and the cost of the work is borne by the Government.

On arrival at the stock yards all animals intended for slaughter are subjected to an ante-mortem examination by a Government inspector. Any animal that is found to be diseased, or not fit for human food, is condemned and marked by having a metal tag, stamped "U. S.—Condemned," placed in its ear. These condemned animals are killed under the supervision of an employee of the Bureau of Animal Industry, whose duty it is to see that the products of such animals are rendered in such manner that they shall not be fit for human food. At the time of slaughter all animals are again examined, and if found to be diseased, the carcass is marked with a yellow condemnation tag, and removed and rendered so that no part of it can be placed on sale for food. Provision is made to insure the proper rendering of the condemned carcasses by requiring the return to the inspector of a numbered stub removed from the tag of condemnation at the time the rendering is done. This insures the proper rendering of the carcasses. Only those carcasses and meats are inspected that are intended for interstate or export trade.

Each article of food made from inspected carcasses must bear a label on which appears the official number by which the establishment is known to the Department of Agriculture, and a statement to the effect that the article has been inspected according to law. A copy of this label is filed with the Department of Agriculture at Washington to serve as a mark of identification that the products to which it has been attached were properly inspected. Each package shipped has stenciled upon it "For export" or "Interstate trade," as the case may be, and, further, the official number of the establishment, the number of pieces or pounds in the package, and the trade-mark of the firm. Upon such packages the official of the Department pastes meat-inspection stamps, which are immediately canceled, certifying to the wholesomeness of the product, and its fitness for food. These stamps must be obliterated as soon as the package is opened.

Live stock intended for export are examined at certain designated stock yards, and again at the ports of export. The Department of Agriculture has also representatives at certain foreign ports.

The importance that meat inspection has attained is shown in the table below. The work began in 1891 and has grown steadily since that time. The following table illustrates the growth:

NUMBER OF ANIMALS INSPECTED AT SLAUGHTER FOR ABATTOIRS HAVING INSPECTION, FISCAL YEARS 1891 TO 1900.

Fiscal year.	Number of abattoirs.	Number of cities.	Cattle.	Calves.	Sheep.	Hogs.	Horses.	Total.
1891	9	6	83,889	....	....	....	....	83,889
1892	28	12	3,167,009	59,089	583,361	....	....	3,809,459
1893	37	16	3,922,079	92,947	870,512	....	....	4,885,538
1894	46	17	3,861,594	96,331	1,020,764	7,648,146	....	12,626,835

1899	138	41	4,382,020	246,184	5,603,096	23,836,943	3,332	34,071,575
1900	148	45	4,841,166	315,693	6,119,886	23,336,884	5,559	34,619,188

In 1881 Germany, France, and other continental nations of Europe forbade the importation of American pork, alleging that it was unhealthful, being infected with trichinæ. By these measures the trade was crushed, and for ten years afterwards nearly every market on the Continent was closed to American pork. Notwithstanding considerable opposition to governmental inspection, the work was undertaken in 1892, when 38,152,874 pounds for export were inspected. The amount inspected has constantly increased. The microscopic inspection of pork is performed largely by women. The following extract from the regulations of the Bureau of Animal Industry shows the method of operation:

When the slaughtered hog is passed into the cooling room of said establishment, the inspector in charge, or his assistants, will take from each carcass three samples of muscle—one from the "pillar of the diaphragm," one from the psoas muscle, and the other from the inner aspect of the shoulder, and also from the base of the tongue when that organ is retained for exportation; and said samples will be placed in small tin boxes, and a numbered tag will be placed upon the carcass from which said samples have been taken, and a duplicate of said tag will be placed in the box with said samples. The small boxes will be placed in a large tin box provided with a lock. The boxes containing the samples from the hogs in the cooling room so tagged will be taken to the microscopist for such establishment, who shall thereupon cause a microscopic examination of the contents of each box containing samples to be made, and shall furnish a written report to the inspector, giving the result of said microscopic examination, together with the numbers of all carcasses affected with trichinæ. The samples of pork microscopically examined shall be classified as follows:

Class A. Samples in which there are no signs of trichinæ, living or dead, calcified cysts, or other bodies or substances having any resemblance to trichinæ or trichinæ cysts.

Class B. Samples in which there are disintegrated trichinæ or trichinæ cysts, calcified trichinæ or trichinæ cysts, or bodies having any resemblance thereto.

Class C. Samples in which there are living or dead trichinæ bodies not disintegrated.

All carcasses coming within Class C are removed from the cooling room and disposed of by tanking, or they may be rendered into edible lard at a temperature of 150° F., or made into cooked meat products if the temperature is raised to the boiling point a sufficient time to cook thoroughly the interior of the pieces. Carcasses belonging to Class B are rejected for shipment to countries requiring inspection and certification. In all this work (the microscopic examination, the cutting up of carcasses, the marking of parts, and the keeping of records) the most careful and painstaking efforts are maintained. The result is that the pork exported to countries which require inspection, is not only absolutely free from trichinæ, but has never been affected by these parasites. The amount of affected pork under Class B and Class C is less than 2 per cent of the whole amount examined microscopically.[1]

Table 12 presents the detailed combined statistics for slaughtering, wholesale, not including meat packing; and slaughtering and meat packing, wholesale, as reported at the Twelfth Census.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 218. WASHINGTON, D. C. July 1, 1902.

AGRICULTURE.

WISCONSIN.

Hon. William R. Merriam,
Director of the Census.

Sir: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of Wisconsin, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of Wisconsin June 1, 1900, numbered 169,795 and were valued at $686,147,660. Of this amount, $155,604,970, or 22.7 per cent, represents the value of buildings, and $530,542,690, or 77.3 per cent, the value of the land and improvements other than buildings. On the same date the value of farm implements and machinery was $29,237,010, and of live stock $96,327,649. These values, added to that of farms, give $811,712,319, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $157,445,713, of which amount $69,303,364, or 44.0 per cent, represents the value of animal products, and $88,142,349, or 56.0 per cent, the value of crops, including forest products cut or produced on farms. The "total value of farm products" for 1899 exceeds that for 1889 by $86,455,068, or a gain of 121.8 per cent, but a part of this increase is doubtless due to a more detailed enumeration in 1900 than in 1890.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $41,583,750, leaving $115,861,963 as the gross farm income for that year. The ratio which this amount bears to the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For Wisconsin, in 1899, it was 14.3 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Wisconsin.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.

AGRICULTURE IN WISCONSIN.

GENERAL STATISTICS.

Wisconsin has a total land area of 54,450 square miles, or 34,848,000 acres, of which 19,862,727 acres, or 57.0 per cent, are included in farms.

The general surface is that of a swell of land between three notable depressions, Lake Michigan, Lake Superior, and the Mississippi River. The summit of the swell lies about 30 miles from Lake Superior and from this point there is a rapid descent northward. To the southeast and southwest there are gentler declines separated by a low swell extending southward into Illinois.

The soils of the state are varied. In the northern and western parts there is a sandy loam or loamy clay, permanent and fertile. In the southwest the decomposition of underlying limestone forms a soil highly fertile and easily tilled. From considerable deposits of Potsdam sandstone in the central portion, a soil of relatively low fertility is derived.

NUMBER AND SIZE OF FARMS.

Table 1 gives, by decades since 1850, the number of farms, the total and average acreage, and the percentage of farm land improved.

TABLE 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	169,795	19,862,727	11,246,972	8,615,755	117.0	56.6
1890	146,409	16,787,988	9,793,931	6,994,057	114.7	58.3
1880	134,322	15,353,118	9,162,528	6,190,590	114.3	59.7
1870	102,904	11,715,321	5,899,343	5,815,978	113.8	50.4
1860	69,270	7,893,587	3,746,167	4,147,420	113.9	47.5
1850	20,177	2,976,658	1,045,499	1,931,159	147.5	35.1

The number of farms reported June 1, 1900, was more than eight times as great as the number reported in 1850, and 16.0 per cent greater than in 1890. The total acreage in farm land is nearly seven times as great as fifty years ago. Owing to the fact that from 1850 to 1870 the number of farms increased more rapidly than the total farm area, the average size of farms decreased; since 1870 there has been a slight increase. The percentage of farm land improved, which previous to 1880 reported a steady gain, has decreased since that date, but the loss between 1890 and 1900 is doubtless the result of the use of a more strict definition of the term "improved land" by the Twelfth than by any preceding census.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

TABLE 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$811,712,319	$686,147,660	$29,237,010	$96,327,649	$157,445,713
1890	560,475,894	477,524,507	19,167,010	63,784,377	70,990,645
1880	419,865,346	357,709,507	15,647,196	46,508,643	72,779,496
1870[2]	359,964,310	300,414,064	14,239,364	45,310,882	[3]78,027,032
1860	154,683,386	131,117,164	5,758,847	17,807,375	....
1850	35,067,516	28,528,563	1,641,568	4,897,385	....

[1] For the year preceding that designated.
[2] Values for 1870 were reported in depreciated currency; to reduce to specie basis of other years they must be diminished one-fifth.
[3] Includes betterments and additions to live stock.

Since 1850 the total value of farm property has increased $776,644,803, and in the last ten years $251,236,425, or 44.8 per cent. The increase in the value of land, improvements, and buildings, in the last decade, was $208,623,153, or 43.7 per cent; in that of implements and machinery, $10,070,000, or 52.5 per cent; in that of live stock, $32,543,272, or 51.0 per cent. The value of farm products for 1899 exceeds that reported for 1889 by $86,455,068, or 121.8 per cent. Part of this increase, and of that in implements and machinery, is doubtless the result of a more detailed enumeration in 1900 than in previous census years.

COUNTY STATISTICS.

Table 3 gives an exhibit of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.

[1] Indian reservation.

The number of farms increased in the last decade in nearly all counties, Dodge, Kewaunee, Manitowoc, and Ozaukee, however, reporting slight decreases. Aside from the counties undergoing territorial changes, only one, Waukesha, shows a decreased area of farming land. Decreases in improved acreage are reported for a few counties in the southern part of the state, but this decrease is probably due to a more strict definition of the term "improved land" by the Twelfth than by any preceding census. The average size of farms for the state is 117.0 acres, and varies from 48.7 acres in Milwaukee county to 184.0 acres in Iowa county. The largest farms are, as a rule, in the western part of the state, in the counties devoted to cereal and stock raising, and the smallest in the eastern counties, where dairying and diversified farming prevail.

All counties, except one, show marked increases since 1890 in the total value of farms. Ozaukee county alone reports a decrease in the value of implements and machinery. The increase in the value of live stock was general, all counties reporting considerable gains.

FARM TENURE.

Table 4 gives a comparative exhibit of farm tenure for 1880, 1890, and 1900. Tenants are divided into two groups: "Cash tenants," who pay a rental in cash or a stated amount of labor or farm produce, and "share tenants," who pay as rental a stated share of the products.

The farms operated by owners are subdivided in Table 5 into groups designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other or others owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—

Indian	462	447	5	1	....	2	7
Negro	58	38	5	2	....	4	9

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	80.6	4.6	0.5	0.8	6.0	7.5
White	100.0	80.5	4.6	0.5	0.8	6.1	7.5
Colored	100.0	93.3	1.9	0.6	....	1.1	3.1

In the period from 1880 to 1900 the total number of farms increased 26.4 per cent, and in the last decade, 23,386, or 16.0 per cent. Since 1890 the number of farms operated by owners has increased 13.2 per cent; by cash tenants, 42.2 per cent; and by share tenants, 33.9 per cent. The percentages in Table 4 show that the gain in the number of owners has been slower than that of tenants. The increase in the number of cash tenants and the change in the relative per cent of cash and share tenants is the result of a growing sentiment on the part of both landlord and tenant in favor of the cash payment system, and indicates greater independence and financial responsibility on the part of the tenant class as a whole.

In 1900, 99.7 per cent of the farms of the state were operated by white farmers and 0.3 per cent by colored farmers. Of the white farmers, 85.6 per cent own all or a part of the farm land they operate, and 14.4 per cent operate farms owned by others. The corresponding percentages for colored farmers are 95.8 and 4.2. Indians constitute 88.8 per cent of the colored farmers.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

The value of the farm property of colored farmers is $1,050,505. Of this amount $132,458 represents the farm property of negroes, and $918,047 that of Indian farmers.

Farms conducted by owners have the smallest average area, 111.8 acres, and those of managers, the largest, 238.2 acres. Some of the latter are adjuncts of public institutions, while others are conducted for

1 Less than one-tenth of 1 per cent.

TABLE 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER AND TENURE.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$3,125	$917	$172	$567	$682	14.3
White farmers	3,130	919	172	568	684	14.3
Negro farmers	1,557	334	77	316	352	15.4
Indian farmers	1,515	214	81	177	114	5.7
Owners	2,750	874	165	532	631	14.6
Part owners	4,473	1,110	222	705	913	14.0
Owners and tenants	3,858	1,274	204	765	938	15.4
Managers	7,956	2,275	341	1,148	1,177	10.0
Cash tenants	4,644	1,032	188	688	846	12.9
Share tenants	4,526	988	187	691	886	13.9

wealthy individuals in connection with their summer homes. These farms, as a rule, are favorably located and highly improved, and the average values of the various forms of farm property, shown in Table 7, are much larger for this class than for any other class of farms grouped by tenure. The ratio which the gross income of these farms bears to the total value of farm property, however, is smaller than for the other groups. This is due to the high average valuation of the land and buildings, and to the fact that many of these farms are not cultivated primarily for profit.

The high percentage of gross income shown for negro farmers is due to the small size and consequent intensive cultivation of their farms, and to the low average value of farm property or capital invested.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	169,795	117.0	19,862,727	100.0	$811,712,319	100.0
Under 3 acres	948	1.7	1,605	(1)	1,538,576	0.2
3 to 9 acres	4,264	6.1	25,966	0.1	7,470,136	0.9
10 to 19 acres	4,316	13.2	57,182	0.3	9,611,571	1.2
20 to 49 acres	25,479	37.2	947,329	4.8	54,552,181	6.7
50 to 99 acres	52,590	76.8	4,037,908	20.3	191,346,991	23.6
100 to 174 acres	54,232	134.3	7,284,121	36.7	294,757,934	36.3
175 to 259 acres	18,171	209.4	3,805,408	19.2	141,651,755	17.5
260 to 499 acres	8,659	327.4	2,835,210	14.3	91,598,629	11.3
500 to 999 acres	991	608.7	603,181	3.0	15,668,591	1.9
1,000 acres and over	145	826.3	264,817	1.3	3,515,955	0.4

1 Less than one-tenth of 1 per cent.

The group of medium-sized farms, containing from 100 to 174 acres each, comprises a larger percentage of the total acreage than any other group. For farms containing over 3 acres, the average values of farm property and products rise in unbroken series, with the single exception of the average value of buildings. For the group of farms containing less than 3 acres each, the average values are relatively high. This is explained by the fact that this group includes many florists' establishments and a large number of city dairies. The average gross incomes per acre for the various groups are as follows: Farms under 3 acres, $171.45; 3 to 9 acres, $37.26; 10 to 19 acres, $19.91; 20 to 49 acres, $8.05; 50 to 99 acres, $6.69; 100 to 174 acres, $5.86; 175 to 259 acres, $5.38; 260 to 499 acres, $4.63; 500 to 999 acres, $3.56; and 1,000 acres and over, $1.43.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$3,125	$917	$172	$567	$682	14.3
Under 3 acres	696	786	47	94	290	17.9
3 to 9 acres	915	675	46	116	227	12.9
10 to 19 acres	1,290	717	61	159	264	11.8
20 to 49 acres	1,295	525	86	235	299	14.0
50 to 99 acres	2,312	754	152	420	614	14.1
100 to 174 acres	3,573	1,022	194	646	788	14.5
175 to 259 acres	5,297	1,274	257	967	1,126	14.4
260 to 499 acres	7,188	1,682	331	1,377	1,516	14.3
500 to 999 acres	10,926	2,350	446	2,089	2,169	13.7
1,000 acres and over	18,577	2,764	556	2,351	2,615	10.8

In considering the high gross income per acre for farms of less than 3 acres, it should be borne in mind that the incomes of the florists' establishments, nurseries, and city dairies, of which this group is largely composed, are determined not so much by the acreage of land used as by the amount of capital invested in buildings, implements, and live stock, and the amounts expended for labor and fertilizers.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm. If vegetables are the leading crop, constituting 40 per cent of the products not fed to live stock, it is a "vegetable" farm. The farms of other groups are classified in accordance with the same general principle.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	169,795	117.0	19,862,727	100.0	$811,712,319	100.0
Hay and grain	33,437	122.5	4,099,218	20.6	166,566,221	20.5

Miscellaneous	41,572	103.8	4,314,393	21.7	145,935,558	18.0

1 Less than one-tenth of 1 per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$3,125	$917	$172	$567	$682	14.3
Hay and grain	3,473	887	174	447	634	12.7
Vegetables	2,255	709	131	266	530	15.8
Fruits	2,632	1,032	114	204	850	21.3
Live stock	3,450	1,010	184	754	810	15.0
Dairy produce	3,531	1,077	193	671	709	12.9
Tobacco	3,429	1,119	152	480	1,001	19.3
Sugar	2,432	861	281	346	978	24.9
Flowers and plants	3,828	2,763	224	67	2,159	31.4
Nursery products	5,845	1,760	280	177	2,560	31.8
Miscellaneous	2,248	717	149	396	515	14.7

"Miscellaneous" farms are those whose operators do not derive 40 per cent of their income from any class of farm products. Farms for which no income was reported in 1899 are classified according to the agricultural operations upon other farms in the same locality.

For the several classes of farms the average values per acre of products not fed to live stock are as follows: For farms whose operators derive their principal income from flowers and plants, $347.17; nursery products, $21.80; tobacco, $12.52; fruits, $9.61; sugar, $8.73; dairy produce, $6.78; live stock, $6.05; vegetables, $5.93; hay and grain, $5.17; and miscellaneous, $4.96. In computing these averages, the total area of the farms of each group is used, and not the acreage devoted to the crop from which the principal income is derived.

The wide variations shown in the averages and percentages of gross income are largely due to the fact that in computing gross income no deductions are made for expenditures. For florists' establishments and nurseries, the average expenditure for such items as labor and fertilizers represents a far greater percentage of the gross income than in the case of "live stock" or "miscellaneous" farms. Were it possible to present the average net incomes, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	169,795	117.0	19,862,727	100.0	$811,712,319	100.0
$0	666	84.5	56,268	0.3	827,500	0.1
$1 to $49	2,633	59.3	156,236	0.8	2,908,860	0.3
$50 to $99	6,133	53.8	330,259	1.7	7,124,050	0.9
$100 to $249	27,264	64.6	1,760,314	8.8	46,762,919	5.8
$250 to $499	44,209	90.6	4,004,805	20.2	125,552,800	15.5
$500 to $999	53,429	119.6	6,388,797	32.2	267,332,690	32.9
$1,000 to $2,499	32,397	192.2	6,227,301	31.3	302,220,740	37.2
$2,500 and over	3,064	306.4	938.747	4.7	58,982,760	7.3

The absence of income in the first group is due, in part, to the fact that the enumerators could not always secure complete reports for farms where changes in ownership or tenancy had occurred shortly prior to the date of enumeration. The persons in charge of such farms on June 1, 1900, could not always give definite information concerning the products of the preceding year. The same statement is true, also, of some of the farms with reported incomes of less than $100. To

TABLE 13.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The State	$3,125	$917	$172	$567	$682	14.3
$0	882	224	28	108	....	....
$1 to $49	712	278	28	87	32	2.9
$50 to $99	721	297	34	110	69	6.0
$100 to $249	1,049	397	66	203	172	10.0
$250 to $499	1,758	601	127	354	365	12.8
$500 to $999	3,238	985	185	596	708	14.2
$1,000 to $2,499	6,276	1,656	308	1,089	1,422	15.3
$2,500 and over	13,388	3,018	550	2,294	3,463	18.0

this extent the reports fall short of giving a complete exhibit of farm income in 1899. Other farms with small reported incomes are doubtless the country homes of city merchants and professional men who derive their principal incomes from other than agricultural pursuits.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the Twelfth Census. The age grouping for neat cattle was determined in accordance with their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with the figures published in previous census reports.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—DOMESTIC ANIMALS, FOWLS, AND BEES, ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS. Number.	Value.	Average value.	NOT ON FARMS. Number.
Calves	Under 1	623,343	$4,107,904	$6.59	5,211
Steers	1 and under 2	205,798	3,228,364	15.69	1,087
	2 and under 3	73,319	1,917,616	26.15	804
	3 and over	10,773	412,672	38.30	335
Bulls	1 and over	48,062	1,283,081	26.70	193
Heifers	1 and under 2	285,319	4,526,586	15.87	1,970
Cows kept for milk	2 and over	998,397	29,642,522	29.69	34,414
Cows and heifers not kept for milk.	2 and over	69,094	1,730,773	25.05	157
Colts	Under 1	33,889	788,154	23.26	883
Horses	1 and under 2	41,983	1,871,157	44.57	908
	2 and over	479,884	31,657,164	65.97	83,946
Mule colts	Under 1	543	19,625	36.14	9
Mules	1 and under 2	414	19,867	47.99	11
	2 and over	3,533	204,001	57.74	437

TABLE 14.—DOMESTIC ANIMALS, FOWLS, AND BEES, ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS—Continued.

LIVE STOCK.	Age in years.	ON FARMS. Number.	Value.	Average value.	NOT ON FARMS. Number.
Asses and burros	All ages	428	$8,505	19.87	101
Lambs	Under 1	689,241	1,176,969	1.71	1,208
Sheep:					
Ewes	1 and over	918,638	3,048,269	3.32	2,201
Rams and wethers.	1 and over	67,574	285,118	4.22	386
Swine	All ages	2,014,631	7,580,423	3.76	27,463
Goats	All ages	3,882	12,760	3.29	1,522
Fowls:[1]					
Chickens[2]	....	8,097,399	2,410,714	....	....
Turkeys	....	155,121			
Geese	....	102,224			
Ducks	....	92,800			
Bees (swarms of)	....	106,090	377,105	3.55	....
Unclassified	....	....	18,400	....	....
Value of all live stock.	....	....	96,327,649	....	....

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including Guinea fowls.

The value of all live stock on farms, June 1, 1900, was $96,327,649. Of this amount, 35.6 per cent represents the value of horses; 30.8 per cent, that of dairy cows; 17.8 per cent, that of other neat cattle; 7.9 per cent, that of swine; 4.7 per cent, that of sheep; 2.5 per cent, that of poultry; and 0.7 per cent, that of all other live stock.

The $18,400 given as the value of unclassified live stock represents the value of 74 buffaloes reported from Buffalo county.

No reports were secured of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, however, the value of all live stock not on farms, exclusive of poultry and bees, is $6,893,640, and the total value of live stock in the state is, approximately, $103,221,289.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the changes since 1850 in the numbers of the most important domestic animals.

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1850 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	998,397	1,315,708	555,756	4,918	986,212	2,014,631
1890	792,620	855,327	460,740	5,752	984,972	1,347,750
1880	478,374	650,767	352,428	7,136	1,336,807	1,128,825
1870	308,377	384,917	252,019	4,195	1,069,282	512,778
1860	203,001	318,859	116,180	1,030	332,954	334,055
1850	64,339	119,094	30,179	156	124,896	159,276

[1] Lambs not included.

Every class of live stock shows a very great increase in number in the half century since 1850. For dairy cows, other neat cattle, horses, and swine, this progress has been uninterrupted, but the greatest numbers of mules and sheep are shown for 1880. The number of mules has decreased steadily since, the rate being 14.5 per cent for the last decade. The number of sheep decreased 26.3 per cent from 1880 to 1890, but increased 0.1 per cent between 1890 and 1900. The following increases in number are shown for the decade 1890 to 1900: Dairy cows, 26.0 per cent; other neat cattle, 53.8 per cent; horses, 20.6 per cent; swine, 49.5 per cent.

The enumerators in 1900 were instructed to report no fowls under 3 months old, which limitation was not made in previous census reports. This fact accounts for the small increases in numbers of chickens and ducks and the decreases in numbers of turkeys and geese. Compared with the census of 1890 the present census shows increases of 43.4 per cent and 1.7 per cent in the numbers of chickens and ducks, respectively, and decreases of 24.8 per cent and 21.4 per cent in the numbers of turkeys and geese.

ANIMAL PRODUCTS.

Table 16 is a summarized statement of the animal products of 1899.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS, IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	7,224,733	$1,461,279
Mohair and goat hair	Pounds	514	145
Milk	Gallons	[1]472,274,264	[2]26,779,721
Butter	Pounds	44,739,147	
Cheese	Pounds	1,635,618	
Eggs	Dozens	46,249,580	4,854,020
Poultry			3,398,427
Honey	Pounds	2,677,100	270,742
Wax	Pounds	44,670	
Animals sold			27,131,916
Animals slaughtered			5,407,114
Total value			69,303,364

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of all milk sold or consumed, and of butter and cheese made.

The value of animal products for 1899 was $69,303,364, nearly three-fourths as great as the value of all live stock on farms, June 1, 1900. Of this amount, 47.0 per cent represents the value of animals sold and animals slaughtered on farms; 38.6 per cent, that of dairy products; 11.9 per cent, that of poultry and eggs; 2.1 per cent, that of wool; and 0.4 per cent, that of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms in 1899 is $32,539,030, or 20.7 per cent of all farm products, and 28.1 per cent of the gross farm income. Of all farmers in the state reporting live stock, 134,530, or 82.0 per cent, report animals slaughtered on farms, the average value per farm being $40.19. Sales of live animals were reported by 123,092 farmers, or 75.0 per cent of all those reporting live stock in the state, the average receipts per farm being $220.42. Grant county is first in amount of sales, reporting an average of $559.31 from each of 3,627 farms.

In obtaining these reports the enumerators were instructed to secure from each farm operator a statement of the amount received from sales in 1899, less the amount paid for animals purchased during the same year.

DAIRY PRODUCE.

Dairying is an important branch of agriculture in Wisconsin. The $26,779,721 given in Table 16 as the value of dairy produce is 17.0 per cent of the value of all farm products and 23.1 per cent of the gross farm income. Of this amount, 78.6 per cent represents the value of dairy produce sold, and 21.4 per cent, that consumed on the farms of the producers. Of the former amount, $15,717,043 was received from the sale of 252,450,051 gallons of milk; $4,508,775, from 26,931,757 pounds of butter; $686,629, from 1,638,601 gallons of cream; and $135,938, from 1,558,575 pounds of cheese. The leading dairy counties are in the southeastern part of the state, and, ranking in the order named, are as follows: Dane, Dodge, Jefferson, Walworth, Sheboygan, and Fond du Lac. There was an increase of 168,573,130 gallons, or 55.5 per cent, in the production of milk in the decade preceding 1900. The amount of butter produced on farms decreased 3.4 per cent, and that of cheese made on farms increased 80.5 per cent in the same time.

POULTRY AND EGGS.

Of the $8,252,447 which is the total value of poultry and eggs produced in 1899, 58.8 per cent represents the value of eggs and 41.2 per cent that of poultry raised. An increase in production of eggs of 16,858,796 dozens, or 57.4 per cent, is shown by the report of 1899 over that of 1889.

WOOL.
